EXTRACT

From an Act prescribing Rules for the Government of the State Library, passed March 8th, 1861.

Section 11. The Librarian shall cause to be kept a register of all books issued and returned; and all books taken by the members of the Legislature, or its officers, shall be returned at the close of the session. If any person injure or fail to return any book taken from the Library, he shall forfeit and pay to the Librarian, for the benefit of the Library, three times the value thereof; and before the Controller shall issue his warrant in favor of any member or officer of the Legislature, or of this State, for his per diem, allowance, or salary, he shall be satisfied that such member or officer has returned all books taken out of the Library by him, and has settled all accounts for injuring such books or otherwise.

Sec. 15. Books may be taken from the Library by the members of the Legislature and its officers during the session of the same, and at any time by the Governor and the officers of the Executive Department of this State who are required to keep their offices at the seat of government, the Justices of the Supreme Court, the Attorney-General and the Trustees of the Library.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and Progressive Industry.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, JULY 6, 1872.

VOLUME XXV. Number 1.

Remington's Breech-Loading Rifle.

The Armory of Remington & Sons, at Ilion, New York, is one of the most extensive manufactories of the kind in the world, and the premises upon which the works are situated compriso some 23 acres. There are 25 different buildings, which cover some 3¾ acres, and which, averaging four stories in hight, have a floor space of 15 acres. These works, when in full running order, give employment to about 1,400 men. Some idea of the extent of the business done at these works may be had from the fact that there are some three miles of shafting and about 25 miles of belting in the factory, run by three engines with an aggregate of 400 horse power; water power is also available. Any one familiar with a workshop will readily see what a vast amount of machinery there must be to require so much motive power. Not very long since these works turned out in one month 1,400 rifles and 300 pistols a day. This was an exceptional case, however, as their capacity is set at 1,100 rifles and 200 pistols per day. The business of the firm has steadily and rapidly increased since its foundation, and new buildings have been added and new machinery introduced as their arms became better known and appreciated. Now the establishment is the largest one in the world devoted to the manufacture of breech-loading rifles, carbines and pistols. To give any extended description of the works would require considerable space, so we will confine ourselves to a brief sketch of the famous Remington Breech-Loading Rifle, which forms the principal article manufactured at the works.

This arm was first popularly brought out in the spring of 1866, and soon after was adopted by the Danish Government, and an order given for 20,000, which were immediately placed in the hands of the troops. Having been submitted to a series of severe trials, it has received the preference of the most recent Military and Naval Boards deciding upon arms to be adopted in Denmark, Spain, Sweden, Greece, France, Rome, Egypt, United States, (Navy and Army,) Cuba and the State of New York. More than half a million arms constructed upon this system have been supplied to troops. The arm is chiefly distinguished for its remarkable simplicity, combining, as it does, its lock for firing and its breech-loading contrivance in one compact mechanism, composed of the fewest possible parts, and each part simple in its construction and purpose.

The working parts are all securely protected in the frame, while the upper and lower extensions of the frame (to the rear), afford the strongest guards to the stock at the weakest point, the neck. The interior mechanism is not likely to get out of order—as all delicate springs and pins are avoided, and there is no occasion for those sliding surfaces which in certain other arms create liability to stick, from rust, etc. The strength of the mechanism of the Remington system to resist the recoil of a charge, is admitted to be the strongest in the world. Fig. 3 of the accompanying cut represents a sectional view of the breech-loading rifle, showing the breech

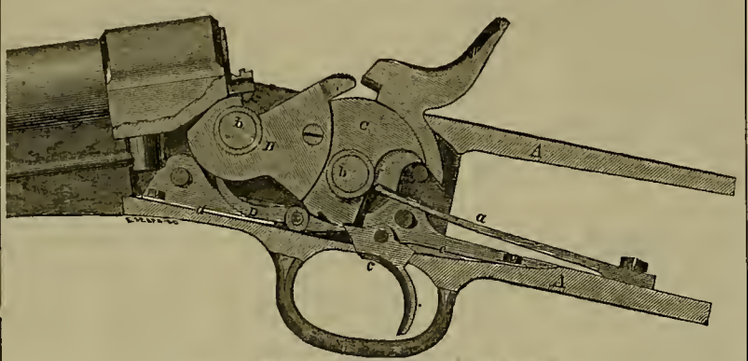

FIG. 1. BREECH OPEN TO RECEIVE CARTRIDGE.

system at the moment of discharge. It will be seen that at the moment of discharge the breech-piece is immediately supported by the front portion of the hammer, which

FIG. 2. IN POSITION TO CARRY WHEN LOADED.

forms a powerful recoil shoulder. Both pieces are made of the best solid steel, and are supported by solid steel pins, which pass through the strong iron frame from

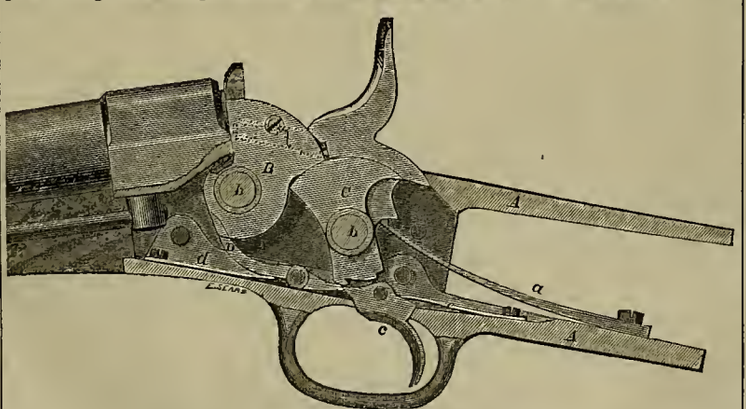

FIG. 3. BREECH AT MOMENT OF DISCHARGE.

side to side. These metal parts are so located as to equalize their capacity to resist recoil.

By the peculiar interlocking and bracing of the hammer and breech-piece, the greater the recoil, the more securely is the hammer locked. And, as the shoulder of the hammer becomes a fulcrum, the entire strain upon the axis of the breech-piece results on that part in the rear of the forward pin. The arm is easily handled, and the common soldier requires only brief instructions or training, since the motions are few, easy and natural.

Putting in the cartridge is effected by merely entering it at the mouth of the chamber and swinging forward the breech-piece to push it in (instead of using the finger for the latter purpose, as in certain other arms). When the breech-piece is thus closed the arm is ready for discharge. Fig. 1 is a sectional view of the rifle, showing the breech system when open to receive the cartridge. In the cuts *A A A* is the receiver, *B* is the breech-piece, *C* the hammer, *D* the locking lever, *a* the main-spring, *b b* pins, *c* the trigger, *d* the lever spring, *e* the trigger spring, and *f* the firing pin. Withdrawal of the empty shell is accomplished by a strong extractor, having a straight backward motion, in the act of opening the breech-piece to receive subsequent charge; the breech-piece withdraws the shell easily. The mechanism can readily be dismounted, cleaned and put together again by a novice. Fig. 2 shows the breech portion of the rifle in position to carry when loaded (half-cocked).

The Remington system has developed the greatest rapidity in firing consistent with simplicity. At a test trial in Belgium the Remington was awarded the first prize, having been fired 15 times, then taken in pieces, re-assembled and again fired 15 times, in the space of one minute and thirty-nine seconds. When loaded and at half-cock, the arm cannot be discharged by any violent concussion or by accidentally pulling the trigger. It can be made of any desired weight, from 6 to 10 pounds, depending upon the dimensions of the barrels required. It is well known that accuracy and range in shooting depend upon the barrel and kind of ammunition used. Barrels of any required length, calibre or rifleing, and suited to any metallic cartridge, can readily be used in this system. Springfield and Enfield rifles are easily transformed into breech-loaders of the same calibre, by substituting the Remington system in place of the old lock, which can be done for less than half the cost of a new gun; and if at any time after such alteration it should be deemed desirable to substitute a new barrel of improved calibre and rifleing, that can also be done by screwing the new one into the same breech system. Official reports and certificates from the Governments of Denmark, Greece, Sweden, Spain, Belginm and the United States are on file in our office, if any interested desire to see them.

PATENTS IN CANADA.—A letter from our correspondent in Montreal, dated June 14, 1872, informs us that, by the bill for the amendment of the patent law, all inventors may obtain patents in Canada on the same terms as residents. This bill has passed both houses of Parliament, received the sanction of the Queen and will become a law on the 1st of September. It must, however, be remembered that, by the 7th section of the new law, the patent is invalid if a patent has been granted in any other country for a longer period than one year before filing the application in Canada. The inventor must also by the 12th section, elect a domicile in Canada, where the Patent Office may correspond with him or the solicitor presenting his application here.

GUANO.—Large deposits of guano are reported to have been discovered north of Callao, by a scientific expedition fitted out by Harry Meiggs, the railroad king of Peru.

CORRESPONDENCE.

Heavy Mine Blasting in Dutch Flat.

EDITORS PRESS:— Considerable interest has been manifested in the result of some large blasts of nitro glycerine powder, lately exploded in this place; and as this is a matter of much importance to Deep Gravel Miners I ask a place in your columns for the statement of a few facts.

These blasts were two in number; one of Giant Powder No. 2, and the other of Hercules Powder. The same quantity of powder was used in each, viz: 2,500 lbs.

The Giant No. 2 was fired in a body of ground in the deep shaft claim known as the Island. This body of ground was about 200 feet square, with a face of 85 feet high, and an average depth of something over 90 feet. It was well relieved on two sides, and partially relieved on the other two, by being washed down as is usual in hydraulic mining.

About the center of this Island a drift was run in to 58 feet from the front, and a cross-drift run on one side 28 feet, and on the other 40 feet. At the ends of this cross-drift, or T, 2,100 pounds of the powder was placed; the balance, 400 pounds, being placed in a body of hard cement, extending in front from the main bank about 40 feet, and 18 feet deep, into which three small chambers were run for deposits for the powder. These separate charges were all fired simultaneously by electricity.

The Result.

The small bank of hard cement in front was thoroughly pulverized, and rendered in good condition for washing. The large bank had numerous cracks through the surface, immediately over the powder, and extending for some distance back — and some of them reaching nearly or quite across the bank, but none of the bank thrown down, as is usual with blasts of the common blasting powder.

This blast was exploded on the 22d of May, and washing commenced about two days after that date. The small bank in front washed well.

Soon after piping was commenced on the main bank, a large hole or cavern was discovered in an angle of the face, nearly 40 feet high, and reaching back to an unknown depth. This at first was supposed to be the effects of one of the large deposits of Giant Powder; but on continuing washing for two weeks, it was discovered that the cavern had no connection with that blast, but was the result of a blast of common blasting powder, which was fired some three years ago, one chamber of which was not washed out; the water of that season failing before it was reached.

There seems to be a firm wall of cement standing beyond the reach of the black powder blast; but the men working in the claim feel confident that they will soon get some caves from the Giant blast, and feel very hopeful that the blast is a good one.

The Hercules Powder Blast,

Was exploded on the 9th inst., also by electricity, in the Badger claim, in a bank similar in many respects to that in which the Giant was used, both banks being of well cemented gravel, and free from layers of sand. The bank was something over 200 feet square, of irregular shape, with an average depth of 77 feet. The face was of the shape of the inner or concave front half of a horse shoe, and about 65 feet high. It also had one side partially relieved by a washed out ravine.

The main drift for this blast was run in 55 feet from the front, with a T, one side of which was drifted 40 feet, and the other 32 feet; it also had a small drift running off from the main drift about 30 feet from the front, on one side 25 feet, and the other 22 feet.

In these several headings were placed 2,025 pounds of Hercules Powder — the balance, 475 pounds, was distributed in three places in a drift extending 25 feet into one side of the concave front as a relief to the main blast.

The front of the bank was broken and thrown forward nearly to the back drift of the T, and numerous cracks run to the surface, immediately over and back of the principal deposits of powder.

The work done by this blast was more like that of a common powder blast, the action of which is well known, often lifting the whole mass of gravel, plunging it forward and throwing it down. Four or five days piping has been done on the Hercules blast; it washes well. It is contended by the advocates of nitro-glycerine powders for bank blasting, that although they do not make so good a showing on the surface as common blasting powder, and do not throw the bank as much, yet that they do better work by pulverizing the hard cement at the bottom and in the immediate vicinity of the powder. This fact remains to be demonstrated and can only be determined by washing down the ground of these, and other blasts that may be put in.

The large blasts of nitro-glycerine powder at Smartsville last year were nearly failures, one of which was 1,500 pounds and one of 3,600 pounds. Whether these will prove of more value remains to be proved by washing. At present it would seem that if they can be made available at all it will only be where the ground is wholly of a hard and compact character and devoid of sand streaks, indeed in such exceptional cases as those just experimented with in this place. The miner will need full demenstration of its efficacy before he will risk 50 cents per pound for any explosive to blast gravel banks. Each of these blasts have cost the respective companies nearly $1,300. It is difficult to institute a comparison of cost with black powder, as no blasts of over 300 kegs, or say about $950 in value, have been fired in this mining district, if we except one in the D. F. B. G. Co.'s claim, which was fired under very unfavorable circumstances. BLUE GRAVEL.

Dutch Flat, June 16th, 1872.

Observations of a Practical Miner.

MESSRS. EDITORS:— In almost all mining regions the soil is generally barren of vegetation. Go where we will, in Europe, Australia, America or elsewhere, wherever there is a profitable mineral region, there you will meet with scant vegetation. This is the case with the mining regions of "the West," and the coal regions of Pennsylvania. A mineral-bearing region is just such an one as the agriculturist would seek to avoid; but the indications there are always such as would interest the searcher after minerals.

Miners generally prefer a vein dipping at an angle of about 45°, and from that to a perpendicular. Still, veins at a larger angle are profitably worked, especially those of coal. Some of the tin and copper mines of Cornwall are almost flat, yet at the same time rich in minerals.

Miners who have always resided in one locality are apt to acquire prejudiced notions with regard to the minerals in their neighborhood. For instance, when in England the writer heard Cornish miners remark that copper could not "live" in limestone, and such is verily the case — that is, to any great amount — in Devonshire and Cornwall. Although a splendid vein of copper ore may present itself at the surface, it is sure to die out prematurely. This, however, does not prove that all limestone formations are non-productive; for it is observable that there are peculiar characteristics in that formation, it being like other stratifications—some parts highly mineralized, whereas other localities are barren of all valuable mineral. Experience is the only safe-guard.

It is conceded, however, by a majority of practical miners, that veins in the limestone formations are not so well defined, or their declination so unerring as veins in granite, slate or trap, and the minerals found therein are more frequently found in deposits; yet there is no serious objection to mining in such formations, for Germany has many good mines in limestone. Such, also, occur in the Middle and other States of this Union, and in the Territories, especially Utah, wherein is the world renowned "Emma Mine," a most remarkable deposit in limestone.

Argentiferous galena, lead, zinc, plumbago, etc., are found in many different stratifications; but are more frequently found, and generally more permanent, in the limestone formation than any other; this is proved by the lead mines of Great Britain, where the principal source of lead ores are Derbyshire, Cumberland and the hills of Lanarkshire—well-known lead-mining districts; also in Illinois, Wisconsin, and especially Utah, in the United States—all in the mountain limestone. Thus we infer that in such districts those minerals are more likely to occur than copper, tin, and many other metals. It is an undeniable fact that copper, tin, and many other mineral veins do not extend to as great a depth in limestone as in other formations; neither do they show the same composition at the surface as in granite, slate, or trap; I have known veins of copper ore in the slate and trap formations where snow could not remain, owing to the heat, resulting from chemical action on the minerals beneath. Iron pyrites, and some other minerals, when present in mines, in large quantities—in mines of copper, nickle and coal—often cause great heat, sometimes rising to 90°F. The dumps at the surface, containing the refuse from such mines, not unfrequently, when sufficient moisture is present, ignite and burn for some time.

Gold, silver, lead and iron mines, if properly ventilated, seldom reach to such a degree of heat as those just referred to; hence, we must expect a greater chemical action, or using the common phrase, a larger "blow-ont," at surface from veins producing copper and nickle in their own formations — or formations favorable to their especial development — than most other minerals. Why in their own formation? Because there is generally a greater body at a greater depth in a favorable formation.

We frequently hear, that such and such a mine is nothing but a deposit or pocket. Now, by a deposit or pocket, is meant a body, either a large or small amount of mineral imbedded in the earth without any sign of a vein; just the same as if a pit was dug and filled with some substance foreign to the surrounding strata. I have seen many mines which were nothing but deposit after deposit to the depth of 600 feet; yet there was not a doubt of the existence of a vein.

The existence of a vein is not due to any valuable mineral, for we frequently see veins without a particle of mineral that is of importance to mankind; still they are "veins" traversing strata after strata. Neither does one vein always yield one particular mineral, for the vein may be imbedded in a stratification favorable to many minerals. I have seen copper 'give' or 'die' out and tin or iron take its place; the former is preferable the latter objectionable. Iron often takes the place of lead or galena, this is also ominous. Again if zinchlende predominates at or near the surface in a copper, lead or galena vein, and decreases in depth, such is considered a favorable change; nevertheless many mines have been abandoned, as unprofitable, when this mineral prevailed in abundance at surface which, if developed, would verify the miners adage, that "it rides on a good horse;" but even then it must be in a certain formation, because in the limestone it is liable to prevail, while in other formations it is otherwise.

This mineral if found in auriferous or argentiferous districts will produce either of the precious metals. In some parts of Colorado it is abundant, and I doubt not that ere long that territory will remunerate mining proprietors abundantly when those mines shall have been developed to a sufficient depth; for there the veins are principally in granite, where we expect the mineral to extend to a greater depth. In this state, in the slate formation, I have seen copper veins near the surface, composed chiefly of zincblende with but little work done thereon, but at present suspended on account of inexperience or lack of funds, which yet only need a fuller development to verify prior assertions.

Veins traversing different strata are liable to contain minerals agreeing with the stratas through which they pass. We often see a vein extending through different formations, and at the approximation of each we see a decided change, either for better or worse; sometimes the change of stratification may be in depth, if so, there we see a similar phenomena.

It is frequently asserted by the inexperienced, and even by miners themselves, that "where it (the mineral) is, there it is," insinuating that there are no laws by which we can be governed. From people holding to such an idea I differ; for by careful observation there can be determined what strata will produce a certain mineral or minerals, without any hypothosis, or conjecture; and this is what we want to arrive at. The want of the knowledge of the works of Nature in these days of easy acquirement, amounts almost to a sin. I believe that we, as a mining population, are far behind what we should be, for if we were to record our observations as astronomers, botanists and others do, what they observe, we should now be able to trace veins and minerals as easy, in comparison, as the astronomer can a wandering star in the heavens. T. S.

Hydraulic Mining with Slight Fall.

EDS. PRESS:—In complying with your request for information in reference to successful hydraulic mining with light grade for flumes, I cannot do better than by giving you a history of an enterprise successfully accomplished by Gaskill & Bowers. The Ohio Flat Mining Co's claims are situated in Yuba county, near Forehstown, at the head of a large flat, two miles long with a very slight grade all the way. Our claims are 2,787 feet long, pay dirt 300 to 400 feet wide, on bed rock, covered by 15 feet of a sedimentary clay deposit and 15 feet of vegetable mould, etc. We were compelled to commence a mile below our ground on the surface of the flat and pipe out a cut, laying our flume— 2½ by 4 feet—on an inch grade to the rod. We were four years in piping out the cut and laying the flume, at an expense of $25,000.

As the cut deepened to 20 and 30 feet, quicksand in the bottom and the sliding in of the sides gave us much trouble. In places the cut is 500 feet wide on the surface. With 500 inches of water there is no trouble in the flume carrying off all the top dirt from two pipes. When we clean up the bottom, which we do in summer—piping off top dirt all winter—we fork all the gravel that we can from the ground sluice, letting as little heavy gravel as possible go into the flume. The flume is four feet in the soft granite bed-rock in the claim, and the pay gravel is from one to three feet deep. As fast as the dirt accumulates around the mouth of the flume we add boxes, until we have on about 500 feet, and we have now as good a dump as ever and no trouble with the flume.

We are now making our third clean-up. The first year we took out of 150 feet square of ground, $16,000; the second year, $19,000; and a good showing for $25-000 this year.

We have 20 years of as good or better work ahead. This is the result of *our experiment*. Novices alone would have undertaken such a job. A scientific man would never have considered it practicable or invested a cent in such an enterprise.

D. W. C. GASKILL.

The Eureka Grinder and Amalgamator.

This machine, invented by Henry Bolthoff, and manufactured by Hendrie Brothers, is now in successful operation at Whitcomb's mill, in Nevada. The amalgamator consists of a tub about five feet in length, and two feet in width, the sides being in the form of a segment of a circle, so that the bottom, an iron plate, one inch in thickness, forms a concave surface. The muller, another iron plate, one inch thick, is made convex to fit the bottom of the tub, and is suspended from uprights rising on each side of the tub, and made to swing like a pendulum, thus grinding the pulp that passes between the upper and lower plates. There are adjusting screws for raising or lowering the muller. When grinding, its whole weight, several hundred pounds, is brought to bear so that the pulp is reduced to an impalpable powder, polished and rendered susceptible of amalgamation. It is fixed at the extremity of the tables, so that the crushed ore passes from them to the amalgamator. The quicksilver is held on the upper surface of the muller to prevent grinding. This surface is covered with a copper plate, upon which the amalgam is gathered. Mr. Whitcomb informs us that this amalgamator saves about twice as much gold from the tailings as the Bertola pans, with none of the labor or trouble necessary to keep them running, since the work of charging and discharging is constantly going on, and it is necessary to clean up only once each week. The machine now in operation receives the tailings from two five-stamp batteries, and on six-ounce ore saves about $50 a week. So well pleased is Mr Whitcomb with its working that he has ordered another from the Messrs. Hendrie, which will be set to receive the tailings from the other twelve stamps in the mill. With these additions it is believed that $100 a week will be saved, with very little trouble or expense, which otherwise would go down the gulch or only be saved by the troublesome process of handling over and running through pans. This is the first amalgamator of this pattern that has been used, and this has only been in use about three weeks. Should it prove as effective on longer trial as it now promises, it is probably that the Hendrie Brothers will find a large demand for them.—*Colorado Register*.

THE SANTA BARBARA GOLD MINES.—The Ventura *Signal* says of the newly-discovered gold placers in Santa Barbara: "The gold is found in coarse grains, and in the early times large amounts of it were secured by 'dry washing.' Several relics have been found at these places, going to prove that the mines were worked a century ago."

SCIENTIFIC PROGRESS.

Maple Sugar—Its Formation.

The formation of the sugar in the sap of the maple, like many other organic processes, is not perfectly understood by chemists, but the following facts are well ascertained, and afford a partial explanation of the mystery. In the latter part of the summer considerable starch and similar substances are deposited in the cells of the sap wood of trees. These are the stores laid up for the manufacture of the foliage for the next summer. When spring comes the roots of the trees wake up from their winter sleep, and imbibe large quantities of water from the soil, long before the buds begin to swell. This water is of course charged with various salts, some of which, like carbonate of lime, are held in solution by the carbonic acid contained in the water, while others are soluble in pure water. This water is gradually carried up the stem of the tree by capillary attraction and by osmose; but as it ascends through the cells it converts some of their contents into sugar, becoming denser and more saccharine as it rises, until finally it reaches the buds.

If now the weather is warm enough, the buds expand and soon burst into leaves and flowers. The first energies of the tree are devoted to perfecting these important parts; and when this is accomplished the leaves commence to prepare the material for the growth of another year. This is deposited in the new layer of wood which is formed directly under the bark, ready to be taken up again the next spring for the formation of new twigs and leaves, and thus the circulation goes on from year to year. The only part of the trunk that takes any active part in the circulation is the sap or light-colored wood. The old dark portion of the wood in the interior has become clogged up with insoluble matter, and is no longer capable either of conducting sap or of performing any other function in the economy of the tree.

If we wish to make sugar from the sap of any tree, it must be tapped at the time of year when it is most abundantly charged with that liquid, and this is usually a month or two before the leaves begin to expand.

Nearly all our hard-wood trees will yield more or less sugar, but only a very few of them furnish it in large quantities, or pure enough for domestic use. The *Acer*, or Maple family, stands at the head of the list in this respect, and chief among these is the *Acer Saccharinum*, or sugar maple, the juice of which contains from three to six per cent. of cane sugar. That which comes from the tree when it is first tapped is much richer than that which flows later in the season. The first sap ascending the stem naturally dissolves out the largest proportion of the starch and gum. After the sap is drawn it is concentrated by boiling until it commences to crystallize, when it is allowed to cool and deposit the sugar.

During this concentration of the sap the lime salts which have been held in solution are gradually precipitated as the syrup becomes more dense. This deposit, or "nitre," as it is called, consists, according to some authorities, of carbonate of lime; others consider it to be malate of lime or saccharate of lime. The flow of sap varies much with the state of the weather, being most abundant when the nights are cool and the days warm.

This has been explained on the supposition that on warm days the air contained in the trunk of the tree expands, thus forcing the sap out; while as the tree cools off at night the air contracts, and the sap rises from the roots to supply the vacuum, to be again forced out the next day. As soon as the leaves commence to expand the flow ceases, because then the leaves are able to evaporate all the water that the roots can supply. But the continual tapping of the tree, and the withdrawal of its stores of nourishment, soon causes it to languish, and it cannot survive such treatment many years any more than a man could survive the loss of a considerable portion of blood each day.—*Ex.*

SPECTRUM OF THE ZODIACAL LIGHT.—This subject is intimately connected with that of the spectrum of the aurora, because Angstrom announced that the zodiacal light and the aurora both give the same monochromatic spectrum. But Liais, the Brazilian astronomer, has lately been studying the zodiacal light under the very favorable sky of Rio Janeiro, and comes to a different conclusion. He finds that this does not differ from ordinary sunlight, but gives a continuous spectrum. It is, however, too faint to see any dark lines. This result is confirmed by Rev. T. W. Webb, of England, who has recently been observing the zodiacal light with a spectroscope which shows the auroral line very distinctly. He sees nothing like the green auroral line in the zodiacal spectrum.

DETECTING WATER IN GASES.—J. Myers.—The author calls attention to the fact, discovered by him, that when so-called dry gases (dried by the best possible means) are caused to pass through boiling sulphur, that substance will give the means of detecting the presence of water in gases which do not chemically act upon sulphur under these conditions.—*German Chem. Society.*

ELECTRICAL.—Prof. Von Bezold is authority for this statement—the result of his own experiments—that when an electrical discharge, after traversing a spark interval, is offered two paths to the earth, namely, a short one and a long one interrupted by a test-plate, with small striking distances, the discharge is divided. With greater distances the electricity takes only the shorter path, and even carries with it electricity of the same kind from the other branch. If electrical waves be sent into a wire insulated at the end, they will be reflected at that end; the phenomena accompanying this process, in alternating discharges, appear to owe their origin to the interference of the entering and reflected waves. Prof. Von Bezold also found that an electrical discharge travels with equal rapidity in wires of equal length, whatever the materials of which the wires are made.

ARTIFICAL WATER LIME.—It has been long known to chemists that water lime consists substantially of quick lime, burnt clay, and a small portion of the oxides of iron and magnesia, but scarcely any effort has been made to utilize this knowledge. All yellow or red clays contain iron, and most specimens of lime in use contain the required magnesia. If burnt clay or brick dust in the fine powder be mixed with an equal weight of fresh slacked lime, and twice this weight of clean, sharp sand be added, a compound will be formed which will harden under water equal to the best hydraulic cement.

VEGETABLE SOURCE OF CARBOLIC ACID.—J. Broughton states that an examination of an oil, obtained from the *Andromeda Leschenaultii*, a common hill plant, proves it to be methyl-salicylic acid and identical with oil of wintergreen. By saponifying this with caustic alkali and dissolving it, methylic alcohol is obtained. This is decomposed with any mineral acid, yielding salicylic acid in crystals, which, on being distilled with lime or sand in an iron retort, yields carbolic acid.

CHEMICAL ACTION IN POROUS FILTERS.—In the course of an examination of filters, at the instance af the *British Medical Journal*, Professor Wanklyn has had proof that filtration through beds of porons materials includes very powerful chemical action, albuminoid matter being instantly resolved into ammonia and other products hy the action of the filter, which, indeed, behaves in this respect like a boiling solution of permanganate of potash. A good filter is a sanitary engine of great power.

ONE of the salts most sensitive to heat is the double iodide of silver and mercury. Its natural color is yellow, but it turns red if warmed, and returns yellow again on cooling.

THE power of magnetism to generate heat has been recently shown by M. Louis d'Henry, a European chemist, in a most interesting experiment.

MECHANICAL PROGRESS.

The New Mode of Conveying Compressed Air as a Motor.

We made reference, a few months since to some interesting experiments which had just then been concluded in Portland, Maine, with regard to an improved method of conveying air or steam for motive purposes, so as to avoid the usual amount of friction against the walls of the conducting pipe. The principle involved, and mode of testing the same, is stated as follows:

"Given to transmit the full effect of an air compressor (not of the prime motor), at a pressure of say 40 lbs. to the inch. The first step is to determine the size of the conduit pipe. Set a pressure gauge on the reservoir which receives the compressed air, and when a pressure of 40 lbs. is indicated, open an orifice in the reservoir so large as to exhaust the effect of the compressor as fast as delivered.

The compressor is now working into the reservoir, the orifice is now blowing off, and the gauge stands at 40. Suppose the orifice to be one inch in diameter. Now attach to the same a pipe of one inch calibre, say 100 feet long. At a point near the outer end of this pipe set a pressure gauge, and the pressure, with the pipe wide open, will be found to be something less than 40 lbs. The element of friction has been developed in the pipe, and will accumulate rapidly as the distance is increased, and it is evident that a pipe of the diameter of the original exhaustive orifice will not convey the force without loss.

Take a new pipe 1¼ inch diameter; on this find the point where a slight diminution of pressure is indicated by the gauge. Just beyond this point insert a ring of one inch orifice in the pipe, giving a shoulder, all round, of ⅛ inch, and the lost pressure will be found to have been restored.

The effect of the ring or diaphragm is to line the pipe with a hollow cylinder of air throughout, which cannot advance, being prevented by the ring and held against the pipe with a pressure of 40 lbs. to the inch, and all the friction which occurs is, consequently, that of air against air.

There are now at a considerable distance from the reservoir, an orifice of one inch, and a pressure of 40 lbs. to the inch, and there being no more than these at the reservoir itself, no force has been lost in the transmission. The reservoir has been virtually moved forward to this point. Repeating the operation at the same distance out from this point as from this to the reservoir produces the same result. Each joint or section of the pipe charges the succeeding with original force, and it would seem that there can be no limit to the application of the principle."

This invention is the product of the ingenious brain of an old Californian, Mr. Robert Spear, who not only conceived the idea in San Francisco, but made his first experiments here in July, 1866. Mr. Spear afterwards went East, where he continued his experiments, and when he made his application for a patent, the United States Patent Office sent its ablest examiners to Boston to test it. The Department would not grant his claims to their full extent, until after such test had been made—so it is reported in the Boston *Advertiser*.

So preposterous were his claims that the commissioners thought he was crazy when he first made his application for a patent.

Mr. Spear demonstrates the correctness of his idea of the mode of the passage of the currents of air or steam through his new conduits by using colored fluids in glass tubes provided with his invention, and by which it is plainly shown that the propelled current is kept in the center of the tube, without any friction at the sides. If, by a diaphragm pierced with holes at the sides, this current is forced to divide and seek passage next the inner surface of the pipe, it at once resumes its course in the centre after the obstruction is passed. Mr. Spear has also discovered that while any angle or bend in any ordinary pipe obstructs a fluid flowing through, by enlarging the pipe at angles, the friction and loss of power is overcome. At Mount Cenis and at the Hoosac tunnel it has been found necessary greatly to enlarge the whole conducting pipe for every mile of distance the compressed air has to be forced. This, of course, seriously increases the expense. Mr. Spear's invention greatly reduces the size of conduits necessary for long distance.

The claim set up that this invention proves the existence of an exception to the law of physics, that there can be no motion without friction—that not a particle of diffcrence can be detected between the pressure at the reservoir and at the extreme end of the conduit pipe, must still be taken with many grains of allowance notwithstanding "the concurrent testimony of the most eminent men of the country to that effect." There *must* be friction in passing the iron rings; and it cannot be possible that even a current of air can pass through air at rest without friction.

A NEW INVENTION.—It is probable that before long the usual notice to be seen on board steamboats, "No smoking allowed abaft the funnel," will have to be discontinued, owing to the absence of any funnel abaft which smoking can be prohibited. Smokers will be simply requested to discharge their smoke into the water. According to the *Swiss Times*, two Austrian marine officers and a marine engineer have discovered by united experiments a method of conveying away under water the smoke from the steam engine, instead of through a funnel into the air. They make use of double ventilators, which compress the smoke and force it overboard. For propelling these ventilators they employ, according to circumstances, either water power—that is, the pressure of the water between the surface of the water and the place where this apparatus is fixed—or, for smaller vessels, steampower. The advantages of this discovery are the greater security of ships of war, as in armor-plated ships the only vulnerable part, the funnel, will be taken away. Other advantages will be the saving of space now occupied by the passage of the funnel through every deck, as well as security against danger from fire; complete regulation of the draught, and in consequence of that, the application of a method for consuming the smoke, thereby effecting a saving of fuel; and, finally, better ventilation of the boiler. For submarine and torpedo ships and monitors this discovery will be of great value, as those last will be rendered quite invulnerable. The trials that have been made have, it is alleged, resulted in a complete success, even to the smallest details.

A NEW BUILDING MATERIAL.—A new kind of material, called "Mezzo marble," has just been introduced in England, and seems to create great attention among all the architects and decorators. It is a material professing to have all the qualities of marble, not only as to beauty of finish but durability, and can be produced at one-tenth the cost of marble, and one-half that of scagliola or enamel slate. A large number of architects and other visitors were recently invited to see the works in London, and a very fine specimen of the workmanship—a splendid fountain, which is intended to be shown at the forthcoming Dublin exhibition, previous to its removal to one of the seats in Ireland of Sir Arthur Guinness.

SALTS OF COPPER A PRESERVATIVE AGAINST MOULD.—The application of salts of copper to stones exposed to the atmosphere (the sulphate, or blue vitrol especially) is strongly recommended, for the purpose of preventing the growth of cryptogamic plants, which so frequently injure them. Housekeepers who are distressed by the formation of a green coating upon the pavements in damp yards and shady places, may perhaps find in this hint a suggestion of a method of preventing the difficulty in question. It is probable that crude carbolic acid will have the same, but perhaps a less durable effect.

STEEL RAILS.—No fact in connection with railroad improvements is more important, just at this time, than the experiments and practical movements towards replacing the common iron rail with one of steel. The Erie railroad is now laying down steel top rails at the rate of nearly 2,000 tons per month. It is expected that within four years the entire Grand Trunk road of Canada will be laid with steel top rails—over 200 miles will be thus laid within the next twelve months. The Baltimore and Ohio and New York and New Haven as well as several other roads, are also rapidly changing their tracks from iron to steel.

The advantage of steel rails over iron, in each of the essential particulars of durability, safety and economy, are now very generally acknowledged. The fear that steel would be more likely to break than iron, especially during severe weather, is now proved groundless. The President of the Grand Trunk road says that while from 3,500 to 4,000 rails break every winter on the iron portion of the track, only eight or ten were broken on the 110 miles of steel track which have already been subjected to the practical test of winter service.

CHICAGO CONCRETE.—A concrete is being used in Chicago for building purposes, composed of one part Louisville cement and three parts sand, ashes, and the finer particles of debris from the burned district. The concrete is mixed somewhat thinner than mortar, and is poured into the pine board molds which shape the wall, and at the same time broken brick and stone from the ruins are imbedded as thickly as may be in the mass, which sets firmly in forty-eight hours. It is then coated over with Portland cement, of which, also, all the trimmings are composed, the surface being so cut and pointed as to be almost indistinguishable from dark gray sandstone. Walls are built of concrete two feet in thickness. The advantages claimed for this material is that unskilled laborers are perfectly competent to do the work under proper supervision, and much expense is thereby saved. Experiments were made several years ago by the British Government, in which a similar concrete was used in the construction of army stables, the labor being supplied by soldiers who had no previous experience in such work. The result of the experiment was reported to be satisfactory in every way.

PIGMENTS FOR COATING IRON.—The *Scientific American* says: "The first requisites for a pigment or coating for iron are, that it should not contain any copper—the corrosive action of that metal on iron being intense. Then if for work exposed to air it should form such a coating as to be impervious to that gaseous fluid, and be so constituted chemically as not to be oxidizable by it; if under water—especially sea-water—to be impermeable to moisture, so elastic as not to crack, so insoluable as not to chlorodize; to form a perfect apparently hard coating, and yet wear just enough to keep off incrustation, barnacles, or growth of grass. In fact, this slow wearing away is the only preventive of fouling in iron vessels."

DRYING LUMBER BY STEAM.—All the pianomakers in New York, and some cabinet-makers, dry their lumber by steam heat. The process is very simple. A large room is provided with systems of iron tubes, through which the steam circulates, and so arranged that the water of condensation flows by itself back to the boiler. No steam or water can get out, so that only the heat gets into the room, in which the lumber is kept for weeks, and even months, at a temperature of 100 to 150° F. Another process is to expose the lumber to the steam itself.

Monday as Pay-Day.

In this age of progress experiment often decides important questions in the social economy, as well as in science. One of the late innovations upon former custom has been the payment of workingmen on Monday, instead of Saturday. Several large manufacturing establishments in England and America have inaugurated this system, which has generally been found to work well. An Eastern exchange, speaking of the plan, presents the following argument in its favor:

The temptation necessarily involved in a day of leisure and a pocketful of money, have been no longer felt. Sunday, instead of being devoted to dissipation, has become a day of healthful recreation and rest; and the week's wages, formerly in great part wasted, have been used to far better advantage. Under the old system it often happens that first-class workmen lose from one to three days early in the week in recovering from the effects of their Sunday excesses. Under the new system this evil no longer exists. It is said that the same number of men do one-and-a-half times as many days' work in the same time, The efficacy of the change has been thoroughly proven. It is to the interest of both master and man; and it therefore lies in the power of every employer to add greatly to the physical and moral welfare of his employés, not only without any loss, but with a positive gain to himself.

MINING SUMMARY.

THE following ie mostly condensed from journals pub lished in the interior,in proximity to the mines mentioned

California.

ALPINE COUNTY.

MOUNTAIN CLAIM.—Monitor *Miner*, June 22: Mr. Ray has recently struck very fine looking ore.

THE Monitor mill hes been running this week crushing ore and concentrating.

THE Tarshish mill is regularly turning out bulliou and will this week have made arrange ments for crushing wet.

THE Copper vein being sunk upon iu the Glohe is said to enlarge and improve as they go down.

SCHENECTADY.—Alpine *Chronicle*, June 23: Good ore is being taken out of the 150 ft. and 64 ft. levels. Last week a very fine body of ore was found in the rise from the lower tunnel to the 150 ft. level.

AMADOR COUNTY.

NEW MINE.—Jackson *Ledger*, June 29; The Rice & Co.'s ledge, Upper Rancherie, is turning out excellent rock. The shaft is down 106 ft. with a well defined vein 18 inches in thickness that will yield over $40 per ton.

CLEAN UP.—J. H. Rice & Co., cleaned up on their hydraulic claims, at Upper Rencheria a few days ago, and received for their winter's work with one hydraulic, $9,000 in clean gold.

BUTTE COUNTY.

CHEROKEE MINES.—Butte *Record*, June 29: The Cherokee Co. is building a large ditch from Butte creek about 50 miles in length. About 10 miles are completed. The work will not be accomplised before next yeer.

The Cherokee Flet Blue Grevel Co. have an almost inexhanstible mine of about 1,000 acres. Already $160,000 have been expended in permanent improvements.

The Spring Valley C. & M. Co. Ex. works are running a tunnel of 1,500 ft. which will bring their claim to the depth of 500 ft. They employ 80 men, and have about 3 miles of rippled flume paved with stone, and numerous undercurrents to catch fine gold. In these nnder-currents diamonds have been found, which have sold as high as $125 each.

CALAVERAS COUNTY.

TO BE RESUMED.—Calaveras *Chronicle*, June 29: Work is to be resumed on the Lone Star mine at West Point.

HUDSON.—Work on the ledge will soon be resumed. New hoisting worke will be put up. The shaft has been sunk 143 ft. the ledge showing splendidly at that point.

READY.—The new 10-stemp mill on the Prussian Hill mine at Railroad will commence crushing next Monday.

THORN.—Calaveras *Citizen*, June 29: The shaft is down about 270 ft. Some Rock taken from the hottom, we should judge will pay $60 to the ton.

INDIAN CREEK MILL.—This Co. are running a 20 stamp mill with 40 hands dey end night.

SHEEP RANCH CLAIM.—Furgusou & Wallace are doing a prosperous business. A short time since they commenced running a lower level from which they are crushing some very rich rock.

WOON'S CLAIM.—This claim is on the ridge between Indian creek and San Antone. The Co. are crushing some very rich rock reaching as high ae $80 to the ton.

EL DORADO COUNTY.

RICH QUARTZ. — Placerville *Democrat*, June 29th: A quertz vein wae found by Peter Gross and S. Holzer, recently, on the northern side of Poverty point. The rock shows plenty of free gold.

TO BE 'STARTED. — Placerville *Republican*, June 27th: The Pacific mine will be etarted up in the course of a month or 6 weeks. The Young Hermon, will also he started shortly up.

STRIKES.—We hear of some big strikes in quartz in Big Cañon, near this city, recently.

KERN COUNTY.

BACCHUS MINE.—Havileh *Miner*, June 22d: This mine hes commenced operations. The ownere are teking out rock valued at $30 per ton. The ledge is about 2½ ft. in width; length of chimney 50 ft. Considerable ore is on the dump.

NEVADA COUNTY.

DAISY HILL.—Gress Valley *Union*, June 29th: We have been ehown some rock from the lower level of the mine, which was covered with fine gold, end indicates that they have again come upou the rich chute that turned out so richly last season. Rock of the kind will go fully $100 per ton. The incline of the Daisy Hill is down 230 ft., and a level run from the bottom 130 ft. north, and 80 ft. south.

BOWMAN DAM.—Nevada *Transcript*, June 26: The North Bloomfield is making active preparatione for the reconstruction of the dam, of the big reservoir at Bowmau's ranch. About 45 white men and 150 Chinamen ere employed.

PLUMAS COUNTY.

PLUMAS EUREKA.—Quiucy *National*, Juue 29: Thie Compeny are egain running with water power, having a new turbine, aud are pounding away at the rate of more than $1,000 a day. They have broken ground for the foundation of a new 40 stamp mill on the east eide of the mountain.

CRESCENT MILLS.—Work is going on eteadily; more men have been put on and a drift ie being run to strike the pay chimney on the secoud level.

MAMMOTH EX. — Wm. Elwell, of Jamison, has recently taken up the northeastern extension of tbe Mammoth quartz lead, and will soon start a tunnel.

GOON ROCK.—The Genesee M. Co. are getting very rich rock from their tunnel, and the ledge continues to improve in size. Their mill is at work steadily, and paying "big."

J. M. Jackson, on his claim at Herdscralble, Mohawk Valley, for his lest clean-up, took out $450, the product of the lahor of 3 men for 3 weeks.

SAN BERNADINO COUNTY.

NEWPORT.—San Bernadino *Guardian*, June 22: We were shown this week the returns of a large lot of ore from Ivanpah, the net result of which was $1,500 per ton, end assayed $1,744. This was from the Lizzie Bullock.

SIERRA COUNTY.

NORTH SIDE.—Downiville *Messenger*, June 22: The North America claim at Hepsidam, is employing 60 men, working day and night.

THE CHALCEDONY cleims, neer Gibson creek, are paying well.

MORE hands are wanted in the Mt. Pleesent claims; $3.50 a day is offered.

IN PORTER'S claim on Whisky Diggings Creek, the tunnel is in 1,600 ft. and in gravel.

THE PILOT CO.'S tunnel, No. 1, just helow the North America claims, is in about 800 ft., and they expect to strike pay in a short time.

RICH LENGE.—A young man named Wehn hes discovered a rich quartz ledge 5 miles west of Eureka.

NEW MILL.—The owners of the 21 Qnartz Claim are putting up a mill on Kaneka Creek.

TRINITY COUNTY

NEARLY THROUGH.—Weaverville *Journal*, June 22: The Union Hill Co. expect to strike through the bed rock this week.

RICH DIGOINGS.—The claim of Ben. Cunniughem, on Bolt's hill, yielded $7,000 last winter as the result of 70 days' run, with 3 men employed most of the time and two all the while.

TUOLUMNE COUNTY.

NUGGETS.—Sonora *Democrat*, June 29: James Craig, showed us this week several pieces of pure gold taken out of his claim on Sullivan's Dry Arroya last week. The lergest weighed 3⅛ ozs., the other $10 and $12 each.

CHEROKEE.—Sonoma *Independent*, June 29: The "Mammoth" lode is paying from $30 to $40 per ton. The Co. are putting up a whim for rock, and are running 2 arastras, with plenty of water. Preparations are also being made to build a mill.

The "Napoleon" lode is yielding rich rock, which peys from $40 to $50 per ton. This Co. will build a mill shortly.

STRIKE.—Henry Wilson has struck a rich vein of gravel, near Fisk's place, Columbia. Prospects as high as $1 to the pan, and will everage 5 bits all through.

Nevada.

ELKO COUNTY.

BUEL.—Elko *Independent*, June 29: The Tecoma is looking better than ever. Twenty men are at work.

The Osceola is also looking well. There is 150 tons of ore on the dump.

Two discoveries have been made within the last week—one called the Tempest and the other the Growl. The ore is milling, and asseye high in silver.

The Molly has a shaft 100 ft. deep, with good wall rocks and very rich ore.

There ie not an idle man in the camp.

EUREKA DISTRICT.

BULLION.—Eureka *Sentinel*, June 28: W. F. & Co. shipped one bar for the Lemon M. and M. Co., valued at $1,500, yesterday.

ITEMS—EUREKA CON.—From the Windsall shaft a fine quality of ore is being extracted. A body of ore has been fouud in one of the old drifts, so thet after many months idleness, the Buckeye is again to become ore-producing.

VALENTINE.—Work has just been commenced, and already e new body of ore has been expoeed a short distance from the old works.

DUNDERBERG.—Four meu are at work iu clearing out a chamber which was filled by a surface cave. . Ae eoon es the drifte are in suitehle order more men are to be employed.

EL DORADO.—Work is to be resumed iu a few days.

ADAMS HILL MINE.—It continues to improve in all directions on the lower levels. The immense body of ore letely developed in the Wide West shaft shows no signe of growing less as explorations are extended. Some rich ore will shortly be shipped to San Francisco, and a crushing is elso to be immedietely made at the Lemon Mill.

SILVER WEST ie yielding a very fine quality of smelting ore. The incline is down over 50 ft., and drifts have been run in various directions, resultlng in the exposure of good sized bodiee of ore lying almost horizontal.

BULLWHACKER.—Work has been resumed on this property, and excellent ore is being brought to the surface.

SILVER LICK.—A rich body of very fine chloride wae etrnck a few days ago in a drift from the main shaft. The averege of the first-class pile is said to go as high as $700 per ton.

ELY DISTRICT.

BULLION.—Ely *Record*, June 23: Dnring the past week W. F. & Co. ehipped bullion valued at $116,667.84

KENTUCKY.—This claim ie on Panaca Flat. The new work consists of a ehaft, down 150 ft., in which a small vein of ore has been cut, assays from which run from $400 to $900.

The Company are erecting hoieting works, part of the machinery heing already on the ground and the rest expected within a few days. The engine is 20-horse power, boiler 30-horse power, with douhle hoisting drum, and was huilt at the Miners' Foundry, San Francisco. Work will he resumed before the end of next month.

CONDOR.—On Saturday night the timbering near the surface of the deep shaft gave way. New timbers were at once placed in position, and sinking is going on as usual. The bottom of this sheft is lookiug better than it has for the past month. It is down 140 ft., and a drift will be run from the hottom when 150 ft. has been atteined. Ore shows from 1½ to 2 ft. in the ledge, the average of assays from which during the pest week has been $199.26.

PIOCHE.—Have cut ledge on lower level and made connection with Meadow Valley, which give good circulation of air. The ledge everages 20 inches in width where cut, and the averege assay of ore from the pest three days has been $192 per ton. Both the Americen Flag and Bowery mills having heen shut down for repeirs, but little ore has been shipped recently. On Friday lest, however, shipping of ore was resumed as usual.

HUHN & HUNT.—Still driving into the hill, with no change at thet point. Heve been working the ledge lying eonth of the one on which the injunction was placed by the Desdemona Co. The ledge is a foot in width, and assays from it show $256 per ton.

STIRLING.—Shaft is down 150 ft. Looking extremely well in tbe hottom, with ledge showing 4 ft. betwcen walls, oreassaying $111.15 per ton.

AZTEC.—Shaft down 60 ft. Ore shows in ledge 18 inches in width, the average assay from which is $88 per ton.

SAN JOSÉ CON.—Sinking on the Justice, shaft continues. The shaft is vertical for abont 28 ft. and then runs on an incline for 105 ft. the vein pitching to the north at an angle of abont 55 degrees. Bottom of the incline is in good milling ore.

AMELIA.—For the past 2 weeks the ledge has been considerahly broken and thrown south. On Friday morning last, however, the solid ledge was again cut into; showing 2 ft. in width ore from which assays $126.

NEWARK.—Drifting on ledge, but will suspend this work in e few days in order to timber the shaft and prepare for the erection of hoisting works.

MOCKING BIRD.—Ore shows at present 4 ft. in width, and asseys run from $40 to $106 per ton.

INGOMAR.—Sinking of main shaft continues, good progress being mede.

HARPER.—The claim is about 150 ft. south of the Condor, on the flat east of town. Ledge shows in the shaft where it was cut in sinking, 3 ft. wide. Assays from different parts of the shaft show an average of $204.21. Shaft down 46 ft.

LILLIAN HALL.—Drift from the bottom of shaft is in 50 ft. Shaft down 200 ft.

CHIEF OF THE HILL.—Connection with the surfece is complete, and ventilation throughout the mine is excellent. Have resumed work on east drift on lower level, and ledge continues to widen and improve.

BOWERY.—Mine improving and developments of an important character may shortly be expected. Mill will stert up again on Pioche ore to-morrow. Furnace nearly completed.

AMAZON.—Vertical sheft down 85 ft. From the bottom of this shaft a drift has been run north 50 ft., at which point the ledge was tapped, and at present showe 2 ft. of low grade ore.

SPRING MOUND.—The whim has beeu started up, end a full force ie employed. Expect to cut the ledges in about 50 ft. more. Shaft down 150 ft. and is well cribbed from top to bottom.

SPRING MOUNTAIN TUNNEL.—Work has been temporarily euspended.

MEADOW VALLEY.—New building over Sammit ehaft ie nearly completed. Work proceede as usuel in Nos. 7 and 3, from both of which minee the ueual quantity of ore is being shipped.

RAYMONN & ELY.—Mine looking exceedingly well throughout. Ore in lower level drift continues to improve ae opened upon. Still shipping to mill more ore than can be crushed.

EXCELSIOR.—Stoping and sinking of winze continues, with ore constantly improving.

AMERICAN FLAG.—Work progressing as usuel. Steam hoisting works have been ordered and are expected daily.

PAGE & PANACA.—Sinking hes been suspended until the eheft has been cribbed to the bottom. Down 275 ft.

WASHINGTON & CREOLE.—Drifting on stations mentioned in our last continues, good headway being mede. No new developments.

CHAPMAN.—Stoping on ore continues. Commenced raieing ore again on Thursday laet.

PACIFIC TUNNEL.—Work on contract progreesing favorably, good headway beiug made.

ALPS—New shaft down 135 ft. and still sinkiug. Rock very hard.

HUMBOLDT.

BULLION.—Unionville *Silver State*, June 29: Amount shipped from the Arizona, since our last issue, was $7,075.

REESE RIVER.

A CAVE.—Reese River *Reveille*, June 23: A ceve from the old Oregon breast exposed a blind ledge recently on Lander Hill aud some very good ore ie being found in it. George Goodwin located the Accidental claim, commenced sinking an incline on it which is down abont 20 ft., getting good ore.

BOOTJACK.—Blackfan and Farrel are getting good ore. The ledge is about 6 inches thick; the ore will pay about $400 per ton.

STONEWALL.—Gill and Bowers are taking ont splendid ore. The shaft is 63 ft. deep, and a drift is being run on the ledge.

GROVE TUNNEL.—Work is being pnshed at the 125 ft.-level, and 125-ft. west level; the ledge looka well at both points.

LANE ANN FULLER (PACIFIC).—The air shaft from thc 500-ft. level was completed this week. The ore still continnes of a high grade, and everything looks prosperous.

CAMPBELL AND YOUNG.—The shaft is about 35 ft. deep and an incline being sunk on the ledge.

VINEYARD.—Work is egain being prosecuted on the old mine

STAR OF NEVADA.—A contract has been let for driving the main tunnel ahead 100 ft.; work continues on the west level of the Cope ledge, ore looking well. A chute is being raised from the Hazel Queen cross-cut and good ore is coming out. An incline is also heing snnk from the Hazel Queen cross-cut. A recent crushing of ore worked over $600 per ton.

SEMANTHA.—Operations have heen resumed on this mine. The incline is being sunk deeper; very little ore coming out.

JANE LENGE.—Bray & Co. sunk the incline 45 ft. below the break and then run a cross-cut to the ledge; now getting average ore.

WHITLATCH UNION.—Reed & Co. are breasting on their large body of ore. Anderson and Cook continne to get lots of high grade chloride.

MOHAWK (SARATOGA).—This mine still turns out lerge quentities of high grade ore; ahout 40 tons of ore in the ore-house.

OPHIR CANON.—The Murphy Co. has about 30 men employed, stoping, sinking and running drifts; are teking out considerable ore.

BELMONT.—MONITOR.—Letting contracts for new tunnels which will be started in a few days; are extracting from the upper levels 8 to 10 tons daily of No. 1 ore; two-thirds of the working force are drifting on the lead and opening up the mine, uncovering the ore preparatory to more extensive operations when the new mill is completed; mine improving in every quarter; working 40 men.

ARIZONA.—On the seme ledge or vein have let a contract to run a lower level north from main incline; work progressing with favorable indications; working 10 men.

EL DORADO.—Still sinking main incline; down 400 feet; vein strong as ever, full size of the incline. The 340-foot level south, going through a rich chimney of black sulpherets 100 ft. from the main incline; 26 men employed.

BELMONT CO.—Sinking main incline below water; taking out considerable pey ore as they go down; new hoisting works running in good shape; working 20 men.

COMBINATION CO.—The lessees have sterted up the hoisting works to relieve the lower levels of water, and are taking ont very rich ore; working 20 men.

INDIANAPOLIS AND ELLSWORTH.—The incline in the Indienapolis has reached 280 ft. without any feulting of the lode, with a working force of 20 men. About 18 tons of ore is being extracted weekly.

SHOO-FLY.—From this mine about 60 tons of oro heve been taken to mill during the last quarter, yielding betweeu $80 and $90 per ton, and leaving a much larger quantity of a lower grade in the damp.

MANHATTAN TUNNEL.—Work is being steadily pushed on this tunnel, with a fair prospect of cutting the maiu lode of the series—the Enterprise—within a few weeke.

ELLSWORTH.—The Ural S. M. Co., has just let a contract for sinking the incline 100 feet deeper, meking 250 feet before driving a level.

ESTA BUENO.—Two ehifts, of 4 men each, are at work sinking the incline—present depth, 65 feet—and are bringing to the surface a fair qnantity of $200 ore.

AMERICAN FLAG.—The incline on this mine is being sunk au additional 50 feet, making the whole depth 260 feet.

GOON YIELD.—Five and a half tons of unassorted ore from the Monitor mine at Belmont, just worked at the Manhattan mill, yielded $413 92 per ton.

WASHOE.

LOCAL SUMMARY—BELCHER.—Gold Hill *News*, Jnne, 29: Daily yield 280 tons. The south drift at the 1,000-ft. level is in 150 ft. from the Crown Point line, and the fece is in very fine ore. The stopes and ore breasts at the 1,100-ft. level are yielding splendidly, and the eighth floor above it is being opened out, making 50 ft. in hight thet the ore body is being worked. The west drift from the main sonth drift at the 1,100-ft. level is in 102 ft., and hae nearly arrived at the point of intersection with the main incline from above. The main incline is down 433 ft. below the 850-ft. level, and in very herd blasting ground.

OPHIR.—The shaft ie down 70 ft. below the 1,300-ft. level, in good sinking ground, and progressing 3 ft. per day. Prospecting the north drift of the 1,100-ft. level is puehed with vigor, while that of the sonth drift le suspended for the present, and the sinking of a winze is commenced 165 ft. south of the main west tunnel. They are also opening up the 700-ft. level again, as the main tunnele run on that level but partielly prospected it, leaving some 400 ft. of almost entirely new ground between that and the 1,100-ft. level.

GOULD & CURRY—Prospecting ie heing actively pnshed ahead at the 1,500-ft. level. The incline ie down abont 90 ft. below the 1,500-ft. level and still making fair progress.

SAVAGE.—Daily yield 175 tons, principally from the lower mine, with about 40 tons a day from the old upper mine. The iucline ie down 50 ft. below the loweet level, and good progrees still being made. Work is stopped in the north cross-cut at the 1,500-ft. level, bnt the south cross-cut at the same level is still being driven east.

RED JACKET.—We were ehown a sack of ore from this mine a day or two since which as says rich.

IMPERIAL-EMPIRE.—The drift at the 1,500-ft. level shows more quartz and better indications of ore during the last day or two. The drifts at the 1,650-ft. level ehow more encouraging indications.

CHOLLAR-POTOSI.—Daily yield 215 tons. Tho ore sections all continne looking well, especially the west Blno Wing body recently opened. The work of clearing out and repairing the shaft progresscs ae usual.

CROWN POINT.—Daily yield 560 tons, keeping the various mille of the Co. steadily running. The various ore breasts are yielding immeneely, and promising better thau ever.

YELLOW JACKET.—Daily yield 24 tons. The water being all out of the incline, and the 1,500-ft. station is heing cut out and opened.

CONS. VIRGINIA.—Prospecting as usual at tho 500-ft. level and also the lower level, from the Gonld & Curry mine.

OVERMAN.—Shaft down 60 ft. below the 1,000-ft. level, and a strong increase of water encountered. The 1,000-ft. level drift is in 350 ft., and in good running ground.

HALE & NORCROSS.—Daily yield about 50 tons. The winze connection not yet beiug completed between the 1,400 and 1,500-ft. levels; the heat ie very great at the last mentioned level.

OCCIDENTAL.—The ledge is widening and ehowing better prospecte for a good body of ore.

JULIA.—Shaft 885 ft. deep, and prospecte etill excellent. Preparing to erect the new hoisting works machinery.

JUSTICE.—The ore being milled from the south shaft is almost sufficient in qnantity and qnality to pay expenses of working the entire mine.

UTAH.—Building nearly completed; machinery in place and will resnme sinking the shaft as soon ae the wire cable arrivee.

SUCCOR.—New shaft down 165 ft. Good ground for sinkIng. Prospecting as usual in the mine. Mill not rnnning.

SIERRA NEVADA.—Daily yield, about 40 tone. Plenty of prospecting going on, but no new ore development as yet.

KENTUCK.—Daily yield 50 tone.

CALEDONIA.—The 700-ft. etatiou ie being opened. When this is done, sinking the ehaft will be resumed.

SUTRO TUNNEL.—Tunnel in 2,942 feet. Rock hard, but good progress made.

DANEY.—Work progreseing in both shaft and drift.

KNICKERBOCKER.—Shaft down 345 ft. Rock hard, hut hlasts well.

WHITE PINE.

TREASURE HILL MINES.—EBERHARDT.—White Pine *News*, June 22: Breasting out west of Keystone ehaft with a force of 4 men in fair ore.

NORTH AURORA.—The work progresses as usual iu Lady's chamber. The ore in the hreaet ie of an even grade and holds ont in the body. The south chamber is turning out rich ore. There is ahont 600 tons of ore on the dump at mouth of tunnel.

WARN BEECHER.—There ie 5,000 tons of ore in sight in the different hreasts.

BEECHER CON. M. & M. CO.—There is a decided improvement iu the appearance of the ledge matter. There ie 20 tons of ore ehipped daily to mill,

GEN. LEE.—Drift running east in ore on contract. Assaye go as high as $185 to the ton.

NOONDAY.—Will commence ehipping ore to mill on the 20th inet.

SUNBEAM.—Being actively worked eince out of litigation. The shaft ie going down in fine ore.

SILVER WAVE.—Good ore hae heen found in No. 4 shaft.

HAMILTON M. & M. CO.—Work is pushed ahead with vigor on the Co'e. minee. The Pogonip & Othello is improving daily. There ie a large amount of ore on the dumps, which will he ehipped to the Co's. mill, now ready to etart up.

SAN JUAN DEL RIO.—Work goee on, sinking ehaft in the ore body of the hack ledge. A conciderable amount of ore lies sacked on the dump.

ORIGINAL HIDDEN TREASURE.—Work going on with all the force procurahle. 300 tons of $40 to $50 ore in eight in the Big chamber. Ore in the npper tnnnel hae improved, in the past few daye, and a large hody in eight. 100 tons in sight in the Rathhnrn chamber.

PENNSYLVANIA.—Sinking two shafts, both in vein matter, carrying more or lese ore.

SILVER HILL MINES.—Moree & Irvin are turning out good ore from the Owyhee mine. The Silver Plate is showing good ore in the breaets.

OUTSIDE DISTS.—ROBINSON DIST.—The furnace of the Canton M. Co. will eoon he in full hlaet, and it is likely that other furnaces will he erected hy other Coe. Favorable mention is made of the Silver Star. A shaft ie down 40 ft., showing a large body of bromide and eilver glance ore. The Hays mine ie aleo highly spoken of. A shaft ie down about 40 ft., ehowing a 4-ft. vein of milling ore.

Arizona.

HAULPAI.—TUCSON *Citizen*, June 15: Haulpai mines are looking well. Elder's furnace at Cerhat is about ready to run. Coovera furnace at Chloride has commenced operatione. Several new discoveries have been made of excellently rich ore.

Colorado.

SHIPMENTS.—Colorado *Miner*, June 26: Baily & Nott have sent forward for, and on account of owners, since their last report 62,286 lbs. of ore.

BULLION.—Palmer & Nichole have shipped since their last report, 4 bars valued at $2,-367.02.

MARSHALL TUNNEL.—A large and rich vein has been struck a day or two ago, 1,200 ft. from the entrance.

Central *Register*, Jnne 19: Tomlinson's claim on the Kent Co. lode, at 170 ft. ie producing a grade of ore that is yielding from 5 to 7 ozs. per cord. The crevice in the east drift will avcrage 7 ft. in width.

Idaho.

LOCAL RECORD.—Silver City *Avalanche*, June 22: The Empire shaft is down 190 ft and timbering the shaft commenced yesterday. The ledge in tho ehaft for the laet 20 or 30 ft. opened ont to 3 and 4 ft. in width, with about one ft. of very rich ore. The winze ie down some 60 odd ft.

They aro hauling ore from the War Eagle mine to the Owyhee, mill, which etarted 2 or 3 days ago.

The Minneeota ehaft has heen let on contract to sink 110 ft. helow the 3d level. The South Chariot mill will commence crushing Minnesota ore the coming week.

The Mahogany ie looking splendidly all throngh the etopee. The rich hody of ore in the etopes is extending frrther hoth north and south than in the level ahove.

The South Chariot mill is yet runuiug ou Mahogany ore, but will commence on Minuesota next week after which Mahogany ore will be hauled to the Ellmore mill, and 20 stamps put to work thereon instead of 10.

The South Chariot main ehaft ie going down at a lively rate.

The Ellmore ie lookiug well in the drifts running from the winze. The shaft is exceedingly hard einking.

The Pauper shaft ie down 130 ft. The veiu continuee ahout 10 inchee in width, aud is very rich in silver.

Straightening and enlarging the Chariot ehaft goes on ae usual, 300 ft. being alread timberced.

The Illinois Central continuee looking well.

The Phantom has a shaft down 40 ft. and ie yielding ore that mille $70 per ton.

The morning Star boys' are daily expecting to tap the rich body of ore for which they have been running all wiuter.

SOUTH MOUNTAIN.—Jamee Hitchens has again reeumed operations on the Golconda, Original and Galena.

Montana.

PIONEER GULCH.—Deer Lodge *Independent*, June 22d: Ashmead & Allen average over $60 per day to the hand, and have ground that will pay from $50 per day down to wages for the next 6 or 7 years.

MOOSE CREEK.—Parke & Dicky are running 3 arastras on rock from the Dixie ledge. They have about 400 tons of ore ou the dump. Marsceau & Co. are running 3 arastras on rock from the Nonpariel lode. They crush about 6 tons per day. Faulkner & Co. are running at the head of Mooee Creek and are making from $9 to $10 per day to the hand. Dodge and Co. are working in the same locality, ground-sluicing.

Some small hut rich galena ledgee have been diecovered on the divide between Boulder and White Tail Deer Creek.

Joe Alger brought up 645 lbs. of eilver bullion from Phillsburg, Thureday night, the result of the first run of the Stewart Mill since the dry cruehing process has been put in operation.

The Pioneer Co. cleaned up, on Bratton's Bar, about $4,500 laet week.

FRENCH GULCH.—The Swamp Co. last week cleaned up their eluices and got over 130 ozs. of dust. They did not touch their ground sluice, which is suppoeed to be very rich.

The mines in Cable and Oro Fino gulchee are paying well. One Co. on the latter gulch are making $25 per day to the man.

STRIKE.—Virginia *Montanian*, June 20: We mentioned a few daye ago the discovery hy Ed. Covely, of a valuable gold lode at Summit. The new vein gave such unmietakable evidence of worth that Mr. Covely made a teet of 20 tons of the ore at the John How mill last week. The result is 33 ozs. of a superior quality of retort—very nearly $25 per ton. The rock was taken from discovery shaft, 20 ft. from the eurface, where the vein is fully 2½ ft. in width.

CLOVER RANCH.—Heleua *Herald*, June 20: W. M. Elliott & Co., have heen for several seasons putting in a hed-rock flume in Upper Indian Creek, and have just reached hed-rock, with proepects good for all the time and money expended.

Irwin & Co, in the Cheat'em diggine, are running a hydraulic, ae are eome 8 or 10 othere, and all have good paying ground.

Tieleke, Lee & Co., are working in extensive and rich har diggings on the south side of Indian Creek. They have about 3,000 ft. of ground up and down the bar, three or more hundred feet wide, with a splendid dnmp.

Utah.

EAST TINTIC.—S. L. *Tribune*, Jnne 28: The Joe Bowere is under way, though the hidden deposit has not yet been reached.

THE tunnel in the Rising Sun Hill, has again reaumed operations.

THE Brown hoya have taken out some 80 tons of galena, Their prospect is very flattering; the vein ia ahout 4 ft. wide.

The Isahella Victoria is still driving ahead, two drifts heing run. Work on the Undine ia reeumed, a new shaft is to he sunk to the depth of 100 ft.

S. F. Stock and Exchange Board.

WEDNESDAY, NOON, Jnly 3d, 1872.

The sales at the Board for the week ending Wedneeday, the 26th ult., amonnted to $2,330,-000—$800,000 more than the week previous. The most active etocks were the Imperial and the Meadow Valley, 5,400 and 5,800 shares, respectively, having heen sold. The total receipts from the Raymond & Ely mine for June, aggregated $328,795, or ucarly $11,000 per day. The Sierra Nevada mine yielded 155 tons of ore last week; the Crown Point mine yielded 3,255 tone, valued at $115,274. The Eureka mine cleaned up last week 700 ouncce of amalgam. The Hale & Norcross yielded last week, 370 tons of ore; the Chollar-Potosi, 1,070 tons, assaying $37.20 per ton; the North Star 120 tons; tho Savage 1,370 tons, assaying $21.42 per ton.

Stocks have been up and down thie week, as usual, which the following eummary will illustrate. On Friday, mining stocke were rather weak. From previous morning's eales, Gould & Curry advauced $13, and Hale & Norcross 82; Chollar-Potosi dcclined $12; Crown Point, 10; Overman, $5.50; Savage, $11; Yellow Jacket, $3; Caledonia, $4, and Raymond & Ely, Alpha, Ophir, Sierra Nevada and Segrogated Belcher, each $1. On Saturday, etocke were firmer, hut the husiness done was light, Alpha advanced $5; Overman $9; Chollar-Potosi and Gould & Curry, each $10; Coneolidated Virginia, Exchequer and Imperial, each, $1. Crown Point declined $5; Savage $4; Yellow Jacket $2, and Ophir $1. Monday, prices were still firm, but the demand was not active. From highest rates on Saturday, Crown Point advanced $10; Savage and Yellow Jacket, each, $5; Chollar-Potosi $4; Caledona $4; Raymond & Ely, $4, and Overman and Ophir, each, $1. Gould & Curry declined $11; Consolidated Virginia and Exchequer, each, $1.

On Tuesday the demand was still quiet and prices lower. From the highest pricee on Monday, Chollar-Potosi fell $6.50, Overman, $5, Yellow Jacket $4, Gould & Curry $8, Segregated Belcher $3, Crown Point $2, and Golden Chariot $1. Savage went up $5.50, Raymond & Ely $3, Ophir $1.50 and Sierra Nevada $1. Wedneeday the 3d inst., prices were a little stronger, and a fair business was done. From the highest ratee ou Tueeday, Ophir advanced $3.50, Yellow Jacket and Segregated Belcher each $3, Chollar-Potosi and Savage each $2.50, Crown Point $2, Raymond & Ely $2, and Consolidated Virginia $1, Alpha declined $3, Overman $2, and Page and Panaca $1.

Thursday being the anniversary of our National Independence, the San Francisco Stock and Exchange Board adjourned over from Wednesday afternoon, until the following Monday.

GOLD IN SALT LAKE.—An assay from some mud from the bottom of Salt Lake has developed the fact that it contains a small portion of gold—about $2.90 per ton. The mud came rom a depth of 300 feet.

THE FLOOD cauaed by the overflow of the Colorado and Gila rivers, has subsided.

San Francisco Enterprises—Our Sugar Refineries.

Sested as we are in a location which is the point through which the produce of all the grest sugar-growing countries hordering on the Pacific, or comprised in its islands, seeks an outlet, we are forced to regard it as one of the most importsnt of those articles of commerce which we are called on to supply to the people of this coast, snd to those of the territories west of the Mississippi. The refining of sugar stands in importance as the second of all our local industries, the value of the refined sugars and their products last year heing no less than $4,500,000. The refineries themselves are amongst the finest buildings in the city.

The Bay Sugar Refinery,

Located on Battery street, under the shadow of Telegraph Hill, is, alheit, being somewhat dingy in appearance, one of the most imposing structures in the lower part of the city. The main building is 120 feet long by 75 hroad, is nine stories high, and has next door a store-house for the refined sugars. The first story contains the principal machinery used in the refining—the air pnmp and the vacuum pan for boiling. The second story is devoted to packing, and has machiuery for that purpose and for powdering. In the third story is done the crushing, shaving and drying of the sugar. The next five stories are used for draining the sugar, and for grainiug it when it is ready for that proccss. In the ninth story the sugar is melted and prepared for clarifying.

The Process of Refining

Is as follows: The raw sugar is hoisted to the ninth or topmost story, where it is melted and passes in a liquid state through bag filters. It then runs into iron cylinders filled with animal charcoal, which, resting on the fifth story, are sufficiently high to reach the seventh. Here, having been purified, it flows into receiving tanks, and is thence conducted by a pipe to the boiling or vacuum pan on the first story. From this the air, exhausted by the air-pump, carries with it the vapor, etc. This air, vapor, etc., is conducted away hy a large pipe, which passes through two upright cylinders, into the first of which all heavy suhstances fall, and in the second of which the vapor is condensed by a stream of cold water entering from above. From this last cylinder it is conducted away by a pipe. By the exhaustion of the air in the vacuum pan, the sugar is boiled at a much reduced temperature—one of 140 to 170 degrees, instead of one of 212. From the vacuum pan the liquid passes into the receiver in the basement story, whence it is drawn, and that intended for the first quality sugars is poured into conical moulds, which are left in the basement for a couple of days, when it is taken to the fifth story to be drained. While in the moulds it is treated with a saturated solution of the best white sugar, which heing poured over it, passes through it, carrying away all traces of syrup. The balance of the liquid from the mixer is taken to the centrifugals and drained at once, receiving no further treatment till it is dried. The syrup drained off is condncted hy pipes again to the vacuum pan, where it undergoes a repetition of the process already described. From it,second quality sugars are made. The yet superfluous liquid ohtained from the second draining, forms the Golden Syrup of commerce. All the sugars are, after draining, removed to the drying stove in the drying room, where they hecome perfectly dry and hard. Any imperfectly drained portion then remaining, is removed by the shaving machine, when the resulting product is of a uniform color, and is ready to be packed in barrels, half-barrels and kegs for the market.

This company hss the most spproved centrifugal mschines (the Hepworth) in use which facilitste the draining off the syrup in second and third grsde goods. Under the msnagement of Mr. H. Voormsn and superintendency of Mr. Meese, the Bsy Sngar Refinery Co. promises to attain a degree of prosperity not excelled by either of the other companies on the Pacific Coast.

California Sugar Refinery.

This magnificent refinery is located at the southwest corner of Eighth and Brannan streets, having a frontage of 160 feet on the former by 137 feet on the latter, and is five stories high. The first floor or basement is devoted to packing; on the second the melting of the raw sugsr is carried on; the third and fourth contsin the sugar after heing refined, and the fifth is devoted to the process of boiling. The method of refining is precisely similar to that already described as being carried on at the Bay Sugar Company's works, save that the sugar is melted below and is pumped up in a liquid state, to be boiled on the topmost story. The present capacity of the works is 120,000 pounds per day, but this will he doubled when the adjacent new refinery on Braunan street is completed. This is building of brick, will be 190 fcet long hy 90 feet wide, and five stories high like the old one. There are at present employed 105 hands in the process of refining, and 15 coopers engaged in making casks, etc., for the refined sugar. The President of the California Sugar Company, to whom the refinery belongs, is Claus Spreckles, Esq., one of our wealthiest and most enterprising citizens. The establishment under his charge is a monument to the industry and enterprise of San Francisco.

The San Francisco and Pacific Sugar Refinery,

Located at the corner of Eighth and Shipley streets, occupies, with its attendant store-house, with the kiln house, hone mill and cooper shop, the whole of the space hetween two streets, and forms a fine group of huildings, five stories in hight. Its capacity is 100,000 pounds a day, and it will be soon considerahly increased, as large additions are being made. It gives employment to 120 men, and consumes 600 tons of coal per month. The President is Mr. De Ro, nnder whose management the refining has been in every sense a success and has attained to its present prosperous position.

Resume.

The three refineries thus briefly noticed, employ 300 men and will soon have a capacity of over 400,000 pounds a day, and even then we are informed that they will not be able to do more than supply the increasing demand. Our sngars are now fiuding their way to Utah, Montana, and the neighboring territories; hence the necessity for the resumption of operations by the Bay Sugar Refinery, and the preparations to secure additional capacity of the others. The Sugar Refining interest stands prominently forward as a monument to the commercial enterprise and activity of our citizens.

A California Primrose.

ŒOTHERA WHITNEYI.

We give annexed an illustration of one of the most hesutiful of the primrose family—a nstive of Humboldt County, and first brought to the attention of botanists in 1867. It was named *Whitneyi* for Prof. Whitney of the Geological Survey, it having heen discovered by a member of the survey, (Prof. Bolander) while engaged in the prosecution of that work.

The plant grows to a height of twelve to eighteen inches, with oblong, lanceolate leaves. It throws up numeroue stalks, with a profusion of blossome of various shades of crimson, more or less dark, according to exposure to sun, fogs, or a clouded atmosphere; the best developed of which measure fully four inches across. The petals are heart-shaped, with apex downward, with dark crimson blotches ahout the center.

The accompanying illustration, which has been especially engraved for the Press, shows a full-sized flower, and also a reduced outline, exhihiting the habit of the plant. It grows on the low, hilly land in a dry light soil, and so far as we are informed, has not been noticed outside of Humboldt county.

The flower has a enbdued, very delicate odor, much like that of the more fragrant varieties of the lily family. It would no donbt form a most beautiful and valuable addition to our cultivated flowers, and might undouhtedly he greatly improved and rendered double hy carefnl cultivation. Even in its wild, natural condition, few annual plants exceed it in beauty. The seeds should he sown soon after the first rains, so that they may have an abundance of time to take deep root, to support them through the dry summers. They show hlosom from May to Septemher.

A CALIFORNIA PRIMROSE.

Quartz Claims.—An Associated Press dispatch, dated Sacramento June 27, says: There has been received at the United States Land Office here a decision hy Commissioner Drummond at Washington city. It was rendered on issuing patents to certain mining claims and town sites in Amador county, and doubtless will apply to all others. The Commissioner decides that the Act of Congress granting the sixteenth and thirty-sixth sections of public lands to the State of California for school purposes, does not apply to mineral lands, and that parties who have located mining claims with the view of purchasing under the law providing for tho sale of such lands, which may, after survey, be included in the sixteenth or thirty-sixth sections, are entitled to patents, the State having no interest therein. It is also decided that locators of quartz mining claims who have located under the statute providing for the sale of mineral lands and whose claims extend into tracts of lands located for town sites, are entitled to government patents, "hut that it will be necessary, in issuing the patents for the mines, to insert a special clause excepting and excluding from such conveyance any and all town property or municipal rights upon the surface ground so patented, snch as houses, huildings, structures, lots, blocks, streets, alleys, or other improvements not belonging to the grantee named in the patent, and all rights necessary or proper to the occupation, possession or enjoyment of the same."

Fossil Discoveries in Solano County.

Enitore Press:—There has recently been an interesting fossil discovery near this locality, of one more of those gigautic mammothe which in the olden time, clothed in flesh, must have msde the wilderness reverberate with the echo of their loud trumpetings. The fossile just diecovered consiste of one underjaw with the molar grinder entire; one upper grinder and psrt of another; some bones of the neck and hack; some pieces of ribs; part of one shinbone from the knee-joint down to the ankle; a piece of a tusk ahout one foot iu length and a great mauy pieces of different bones much broken up.

These fossils were discovered by a gentleman by the name of Allison, on his farm about three miles west of Rio Vista, in Solano county. The remains were found in a ravine where they had heen partly wsshed bare by the excessive rains of last winter. They were emhedded in the substratum of yellow clay that usually uuderlies the alluvium deposit of hlack adobe.

The bones evidently helonged to some huge mammoth, *Elephas Primagenus*. The piece of tusk is seven inches in diameter and must have been broken off at least six feet from the head of the annimal. The knee-joint is thirteen inches in its longest diameter. I have iu my possession one of the upper teeth that is 9¾ iuches on its grinding surface, and part is gono at that. The neck bonce are 7¼ inches in diameter. They are the hones of a very old animal, as evinced hy the tooth in tho under jaw being nearly worn down even to whero tho gums must ouce have heen.

Thore are prohahly more of tho bones that can he ohtained, aud Mr. Allisou says he will try to find the other tusk which may be iu a hettcr state of preservation.

How iuteresting it would be could we ouly look back at the coudition of the oarth iu tho far-distant past, when these huge mammoths aud mastodons roamed at will in vast herds unmolested by the presence or obstructions of man. How long ago that was it is useless to conjecture, as their remains have heen discovered under such peculiar circumstances as to warrant the belief that the ocean has rolled its stormy hillows over the land siuce they ceased to exiet upon it. W. R. Frink.

Rio Vista, June 18, 1872.

Changes in Lines of Freight Traffic.

Since the Washoe teaming traffic was ahsorhed by the Ceutral Railroad, there is probably no business of that character on tho Pacific coast so large as thst which has beeu carried on between Los Angeles and that vaet and rich mining rogiou, indefinitely known as the Oweus River Country. That region includes almost twenty miniug districts and a dozen growing towns. Tho carriage of supplies to, and of ore, lead and crude hulliou from them has attained large proportions within tho past three yoars, despite the fact that both had to be carried from 150 to 250 milos over a very rough country, and at extremely high rates of freight.

A press dispatch from Los Angeles of tho 15th ult. informs us that the owuers of the Owens Rivor freight lines aro making arrangements to change their hase from Los Augeles to the terminus of the San Joaquin Valley branch of the Central Pacific Railroad, over which passengers are now carried to Visalia, which is nearly 200 miles south of the main line at Lathrop. This change will divert considerable frcighting business from the line of southern coast steamers, which will now seek the chorter and cheaper inland rail and teaming route. The teamsters (one of whom alone employe fifteen huudred mulee) have changed from Los Angeles as a measure of self protection; hut the distance hetween Owens River Country aud the terminus of the railroads will each week be shortened as the railroad is extended southward, uutil eventually one fourth the numher of teams now employed will suffice for the business. It must not, however, be supposed that the remaining three fourths will be driven out of business, the extension of the railroad towards Arizona and the Colorado river will open and create business with many miuing districts which cannot now he worked—just as the building of the Central Pacific Railroad opened up great nnmhers of new mining districts in southern and eastern Nevada, and western Utah, thus giving employment to tho teams which formrly carried supplies to Washoe. There is, therefore, no fear hut that plenty of future work will be found for the teams which will he driven from present linee of freight traffic. The great work of mineral and agricultural development in the vast torritory is yet but in its infancy.—*Bulletin.*

Testing Bark for Tannin.—Make a decoction of the bark or wood, from a definite qnality of the material, and filter. Make a solution of galatin of a determined strength. Add of this to the liquor until no further precipitate is formed. Separate this precipitate, dry, and weigh. Knowiug the quantity of gelatin added, it is easy to calculate now the quantity of tannin. This will be found accurate enough for practical purposes.

Useful Information.

Composition of Patent Medicines.

A German has written a very interesting and nsseful book, on Secret or Patent Medicines, from which has been selected ths resnlt of analysis of a nnmber of the nostrums popular on this side of the Atlantic; and as many of our readers deal in snch articles, and should he familiar with ths composition of what they ssll, we reproduce the formula for their benefit:

Coca Pills, hy Sampson, New York. According to Hagar and Jacohsen, composed of powdered coca and extract of coca in about equal quantities; value, about one-fourth of price.

Eau de Cythére, a hair color restorer, consists of 4 chloride of lead, 8 hyposulphite of soda, 88 water. A similar composition was Eau de fees, which, a couple of years ago, was introduced here. The writer found in a aample also some alkalies, earths, and traces of nitric acid, originating probably in the spring or pump water used. Hagar and Jacohsen give tbe following formula: Hyposulphite of lead, 1¼; hyposulphite of soda, 3; glycerine, 7; water, 88 parts.

Granular Effervescent Citrate of Maguesia, hy Bishop, of London, consists nsrcly of hicarbonate of soda and tartaric acid.

Pommade des Chatelaines, a hair invigorator, consists of benzoinated lard and some volatile oils.

Hamburg Tea, by Frese & Co., of Hamburg: Senna, 6; manna, 3; coriauda, 1.

Magnesian Aperient, hy Moxon, of England, is, according to Sillier, anhydrous sulphate of magnesia, 31; carbonate of magnesia, 14; bicarbonate of soda, 30; tartaric acid, 25 parts.

Swedish Essence of Life, is made also in this country, nnder various names. As nsnally made hy apothecaries, it is a tincture made from 4 aloes, 1 agaric, 1 rhnbarb, 1 zedoary, 1 gentian, 1 myrrh, 1 theriac, with 100 to 120 dilnte alcohol. The secret medicine mauufacturers nsnally substitute cheaper articles for the high-priced saffron aad rbnbarb.

Syrup of Horseradish, by Grimault. Hagar gives the following directions: 50 p. each of fresh scurvygrass, bnckbean, and watercress; 60 of horseradish, 40 of fresh orange berries, are infnsed with 3 cinnamon in 50 p. white wine, and after a day expressed; 250 p. sugar are dissolved in the filtrate.

Iodinized Syrup of Horseradish, by Grimault, contains 10 iodine, and 5 potassium iodide in 8,000 of the former.

Myrrhine, by J. B. George, of Paris, for the preservation of the teeth: Glycerine, 38, myrrb, 7, arrowroot, 5, chalk 54, oil of cinnamon 1 part.

New York Pills, hy Sampson, of New York. The 1¼ grain pills consist of powdered coca 25, extract of coca 30, and powdered iron 35 parts.

Opiato pour les Dents, by Pinand. Syrnp 70, chalk 21, gypsum 7½, magnesia 1½, colored with aniline red, containing arsenic, and flavored with oil of cloves, and of spearmint.

Brandreth's Pills, contain resin of podophyllum, inspissated juice of poke berries, saffron, cloves, oil of peppermint.

Holloway's Pills are composed of aloe, myrrh, and saffron.

Morrison's Pills, 2¼ grains each, consist of aloe, cream of tartar and colocynth; another kind contains the same ingredients, besides gamboge.

Radway's Ready Relief, according to Peckolt, is an ethereal tincture of capsicum, with alcohol and camphor.

Radway's Renovating Resolvent, a vinous tincture of ginger and cardamon sweetened with sugar. (Hagar and Jacobsen.)

Pondre Hémostatique Végétal, by Bonnatour, consists of 4 resin, 1 gum arabic, 1 wood charcoal.

Poudre Uniqne, by Godernaux, of Paris, lauded as a specific against epilepsy, is impure calomel, leaving when heated a slight reddish residue.

Oil of Horse Chestnuts, by E. Genevoix, of Paris, is not the oil of the horse chestnuts, but another non-drying oil, altered by heat so that it has acquired a darker color, a pungent odor and acrid taste.

Screws Inserted in Plaster Walls.—When we try to fasten brackets, strips of wood, etc., to plaster walls by means of screws, it is often found impossible to make the screws hold firmly. When we turn them in, the plaster breaks out and our labor is in vain. And yet, a screw well set into a plaster wall, will hold very firmly. When a screw has broken out and it is necessary to make it hold in that particnlar spot, the best plan is to enlarge tho hole to about twice the diameter of the screw, fill it with plaster of Paris, such as is used for fastcning the tops on lamps, etc., and bed tho screw in the soft plaster. When the plaster has set, the screw will be held very strongly.

Varnish to Imitate Ground Glass.—To make a varnish to imitate ground glass, dissolve 90 grain of sandaric and 20 grains of maetic in two ounces of washed methylated ether, and add in small quantities, a snfficiency of benzine to make it dry with a suitable grain—too little making the varnish too transparent, and excess making it crapy. Tho quantity of henzine required depends upon ite quality—from half an ounce to an ounce and a half, or even more; but the best resnlts are got with a medinm quality. It ie important to use washed ether, free from spirit.

Old Rubber.

A fortune awaits the happy inventor who shall teach manufacturers to restore old rubber to the condition in which it was before vulcanization, for with that secret, there would bs practically *no consumption* of this invalnahle article. The thing has been dons, and successfully, and we have ourselves seen pieces of vulcanized rubber, possessing great strength and elasticity, which were made entirely from old car-springs; but it has never hoen accomplished on a large scale, and awaits the enterprise and ingenuity of some new Goodyear to develop it.

Meantime, old rubber has its nses. By a system of steaming and passing between rollers, it is reduced to a semi-plastic state, and in tbis condition is nsed in combiuation with a coarse fabric for heel stiffening, a purpose to which it is admirably adapted, its waterproof qnalities being of especial valne. There is in a neigbboring city a factory devoted entirely to this branch of manufacture, where several hundred tons of old rubber of all kinds are consnmed annually.

Old rubber is also largely nsed to mix with new raw material in the manufacture of all kinds of rubber goods. It serves to give bulk and weight, and, if it does not increase, it certainly does not lessen the strength of the fabrick. It may also be mentioned that powdered soapstone, white-lead, terra alba, and otber heavy substances enter largely into the composition of almost all rubber goods, the nse of which becomes apparent when it is remembered that they are generally sold hy weight.

Cocoa-nut Oil.

Residents of temperate zones have no realization of the immense importance of the cocoa-nut in countries where the tree abounds. It yields a delicious food, a nntritions drink, a rich oil, and fibers which are manufactnred into thread, twine, ropes, and all kinds of strong useful cordage.

Boiling the pnlp breaks open the cells. As the oil is liberated, it rises to be skimmed off. A few years ago the Dutch government ordered a census of the cocoa-nut trees in Java and Madeira, which footed up twenty millions, being an average of three to every native inhabitant.

Vast qnantities of the oil are burned in lamps throughont the whole Indian Archipelago. A tumbler half filled with water has oil poured in to the brim. Two lighted sticks are tbe wicks, which burn brilliantly. Every native glories in a display of lamps in the honse and abont the grounds at the approach of night.

When first taken out of the boiling pot, the oil has a rich flavor, but soon becomes rancid. So copions is the supply, however, it can always be had fresh and sweet for the table. Like olive oil in Syria, it is butter, lard, or oil, according to circnmstances, in cookery. Soap is made with it, lamps snpplied, leather dressed, and cosmetics are fabricated for hsautifying the homely faces of women.

Something About Anvils.

In a deserted shop in Pittsfield, Mass., there rests on its block an anvil that has done duty for more than three hundred years. It is as sound to-day as it was in 1633, when Eltwood Pomeroy, after welding for the Stuarts the ponderons horseshoes of the same style and pattern that his ancestors had made during generations for the Tudors and Plantagenets, grew weary of taxes without law, and work without wages, and anvil in hand sailed for the new world. A deft workman, he throve in the settlements, and left his anvil as an heirloom to his descendants. They show you in the tower of London the anvil on which the sword was forged that Richard *Cœur de Lion* nsed in his contest with Saladin, and at tho collection of Pompeian excavations in Naples there is an anvil certainly older than the Christian centuries, which, of precisely the same shape we use, had evidently done service for stalwart workmen of many generations before the city was buried. But, better still, in the Egytian room of the British Museum, there is a veritable anvil of the Pharaohs. It is older than Rome, older than Greece, older than Jerusalem; as old as the days of Abraham, and probably in existence when the patriarch "was come into Egypt, and the Egyptians beheld Sarah that she was very fair." It is just like a modern anvil, mado apparently in the same way, weighing about seventy-five pounds, and sound as it was when strnck by the hammer thirty centuries ago.

Ether Glue.—An excellent liquid gluo is made by dissolving glue in nitric ether. The ether will only dissolve a certain amount of glue, consequently, the solution cannot be made too thick. The glue thus made is about the consistency of molasses, and is doubly tenacious as that mado with hot water. If a few bits of india rubber, cnt into scraps the eize of buck shot, be added, and the eolntion be allowed to stand a few days, heing stirred frequently, it will be all the better, and will resist the dampness twice ae well as glne made with water.

The hair on a camel weighs abont ten pounds and eells for more than $100.

Good Health.

Weak Backs and Bad Seats.

Tho small of the hack is the weak or etrong point of every person. It is ths center of volnntary motion. Nearly three bnndred mnscles are directly or indirectly connected with the motions of which the small of the back is the pivotal center. Henco, while tbose who are strong, and whose muscnlar systems ars well balanced, know nothing of spiral weakness or vertebral distortion, invalids are forever complaining of this part of the body.

One very prominent cause of weak backs and crooked spines is the unhygienic, nnanatomical seats and benches of our school-houses, churches and halls; nor aro the seats and heuches provided on steamboats, railroad cars, or at stations or ferry houses any better. It it is impossible for any person to occupy these seats long without being torced ont of shape. And when school children aro confined to them for several honrs a day for month and years, tbeir backs will inevitably be more or less weakened, with corresponding deformity of body, for life.

If we go into private families, even into the palaces of the opnlent, we find the seats made more for show than for nse. Girls snffer much more by nsing such seats than boys, for the reason that hoys are tanght to rnn, jump and exercise tbemselves all over and all through, while girls are expected to keep still and be pretty.

It is certainly one of the strange problems of the nineteenth century that no parent, teacher or mechanic will give any attention to anatomy or physiology in the construction of seats for the human body. Must our chairs, and sofas, and settees, and divans, and *tete-a-tetes*, and pews forever be dictated by fashion, and never conformed to nature? Mnst our tortnred bodies forever be compelled to shape themselves to the seats, instead of the seats being adapted to our bodies? Go through all the great chair factories of the country, and yon will not find a single article that is not pnt together in gross violation of the rnles of health or comfort. If some Cooper, or Peabody, or Stewart, or Vanderbilt, or Astor, would invest a little million of dollars in establishing an immense chair factory "on strictly hygienic principles," he would do more to improve human health, promote longevity and remedy the backache, than any medical college in tbe land.—*From "Backache," in Science of Health.*

Physical Development in Old Times Compared with Our Own Day.—Mr. T. W. Higginson has taken pains to compare the vital statistics of several generations of two old New England families, he finds, to the dismay of those who mourn the physical degeneracy of women since the days of our great-grandmothers, that the stock has improved if anything. He adds:

"No man of middlo age can look at a class of students from our older colleges without seeing them to be physically snperior to the same nnmber of college boys taken twenty-five years ago. The organization of the girls being far more delicate and complicated, the same reform reaches them less promptly, but it reaches them at last. The little girls of the present day eat better food, wear more healthful clothing, and breathe more fresh air than their mothers did. The introduction of india-rubber boots and water-proof cloaks alone has given a fresh lease of life to multitudes of women who otherwise would have been kept housed whenever it so much as sprinkled. It is desirable, certainly, to venerate our grandmothers, but I am inclined to think on the whole that their great-granddaughters will be the best."

Clay Dressings for Variola.

Dr. E. S. Bunker, in a note to the *Medical Record* says:—"During the recent epidemic I used clay-dressing for two pretty decided cases of confluent smallpox. Both patients were yonng women. One, a married lady, aged 23 (delivered on the second day o' a six months' fœtus,) made a fair recovery, took cold after getting up, and in a few days died suddenly of empyema and pericarditis; diagnosis confirmed hy autopsy. The other, single, agsd 21. had the disease with great violence, recovered rapidly, and is now well. In each case I dusted finely sifted pipe-clay over the face as soon as the pustules became fairly developed. This formed immediately a clean, dry, wholesomo scab, abolished the intolerable itching and burning, served apparently as a good absorbant of infectious material, and scaled off during convalescence, leaving underneath a soft, natnral integument. There was no disfigurement in either case."—*New York Medical Journal.*

State Boards of Health Recommended.—Governor Geary, of Pennsylvania, recommends to the Legislature the formation of a State Board of Health, on a plan similar to that of Massachusetts and of California, which were the first States to organize snch Boards. The Governer was a member of the first Board of Health constituted on the Pacific coast. This was during the prevalence of cholera in San Francisco in 1850. We opine that before many years shall have passed by, nearly every State in the Union will have its State Board of Health.

Fevers and Sewers.

Notwithstanding the generally acknowledged deleterions influence of defsctive sewers, it seems to be a well-established fact that men employed to cleause and repair sewers, etc., are not only not carried off by fever but appear to bs singularly exempt from the ravages of that dissase. Ths British *Medical Journal*, of a late date, says that in consequsuce of what has been said with regard to ths alleged causs of tbe late illness of the Prince of Wales, Dr. Bowers, of ths Mstropolitan Board of Works of London, ordered a return on the subject, which presents a most unexpected array of facts which *seem*, at least, to controvert the generally received views with regard to the connection of fevers with imperfect sewerage. We copy as follows:

Ont of five inspectors employed from 23 to 48 years, there has never heen a case of fever. Out of 64 men employed in cleansing and flnshing the northern sewers for periods varying up to 34 years, only two have had fever, and their cases were typhus. Out of 47 men engaged in the sewer work in the southern sewers for periods varying from one to 24 years, there have only been two cases of fever, and theso again typhus; and in one of theso cases it is shown that the disease was contracted from the man's family. There are 36 penstock and flap keepers who have been employed from one to 50 years. Of all these only one had any fever. Ho bas been 16 years at work and had typhoid in 1862. There are some curions notes about tbese men. One of tbem has been at this work 50 years, and has not had one day's illness of that time. One lived 25 years in the sluice-honse over tbe King's Scholars Pond sewer, but never had any fever. Another lived for 14 years in Penstock Honse, over the ontfall sewer at Old Ford. Another lived 32 years in Great St. Paul's sluice-honse. Another lived for 35 years in a house over Duffield sluice, and enjoyed good hsalth. Out of 54 msn employed at the pnmping-stations, thcre has only heen one case of typhoid fever. At Crossness, ont of 54 men engaged during the last six years, there has not been one case of typhns or typhoid.

There have been eight cases of ague, bnt theso are, of conrse, due to the low marshy district and they seem to have recovered rapidly. Out of seven men employed in cleansing ventilators, oiling side entrances, gauges, etc., no caso of fever has occurred though one man has been at the work 23 years. Of ten surveyors and chainmen in the engineer's office, not one has ever had typhoid fever, although they have been almost daily engaged in the sewers for periods of from four to 24 years. These facts aro very gratifying, and qnite dispose of the allegation that the men in the sewers are decimated by fever. The statistics show, in fact, that fever is less prevalent among these men than the rest of the town population.

The Prevention of Small-Pox.

Dr. A. Armstrong, in the *Lancet*, advises the following means in staying the ravagss of small pox: Persons suffering from the discase should daily anoint their bodies and limbs throughont with carbolized oil; and also wash their bodies thoronghly with soft water, slightly carbolized; the anointing to be performed after the whole person has been washed; and gently dried with some soft fabric. This process shonld be commenced before patients are allowed to leave their sick room, and continued until snch time as all the diseased skin has been removed, and a new and healthy one formed. In this way the particles of diseased and desquamated skin are prevented from being set free from persons who have recently suffered, and contaminating healthy persons by being inhaled or deposited on the exposed skin, or by getting into the water or food, and thns be a mode of contagion.

Chapped Hands.—Persons troubled with chapped hands will find the following receipts very good: Take a qnarter of a pound of unsalted hog's lard, and work it well throngh clear cold water, then drain and work again in a wineglassful of rose water; the yolks of two fresh eggs, and a tablespoonful of honey. When well worked together in an earthen dish, mix in gradually as much finely powdered oat-meal as will make a paste the consistency of new butter. For use, spread the mixture on the hands at night, cover with old gloves too largo for the hands; and in the morning wash off witb pure water.

Another cure for chapped or blistered hands: Take a wine-glassful of sweet olive oil, three drachms of grated spermaceti, three drachms of grated gum-camphor, and three drahms of grated whito beeswax. Mix together and put in an earthen vessel over a slow fire, stirring till all are thoronghly melted, with a wooden spoon or stick. When well mixed plunge the jar snddenly into cold water, and the mixture will form a white cake. At night rnb the cake over the hands well, cover with kid gloves, and wash off in the morning in lukewarm milk. A few applications will cure the worst chapped or blistered hands, and if the hands are positively sore, the mixture may be applied two or three timee during the day, keeping on the glove until the cure ie effected.

ADVERTISING RATES.—1 *week*.	1 *month*.	3 *months*.	1 *year*.
Per line.....	.25	.80	$2.00	$5.00
One-half inch.....	$1.00	$3 00	7.50	20.00
One inch.....	2.00	6.00	14.00	38.00

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper, inserted at special rates.

SUBSCRIPTIONS payable in advance—For one year, $4; six months, $2.50; three months, $1 26. Clubs of ten names or more, $3 each per annum. $6, in advance, will pay for 1½ year. Remittances by registered letters or P. O. orders at our risk.

English and Colonial subscriptions, post paid, per year, £1 3s.; 6 months, 12s. Advertisements, per line, first insertion, 1s.; subsequent insertions, each, 6d. Large advertisements at special rates.

ILLUSTRATIONS AND REPORTS OF MINING ENTERPRISES WANTED.—Drawings or photographs of mining works that are of general interest to our readers are solicited for publication in this journal. Official reports of Companies, and description of mines of importance, or of special interest, are also desired. Sketches of any new method and discoveries will be very acceptable.

Gold and Legal Tender Rates.

SAN FRANCISCO, Wednesday, July 3, 1872.—Legal Tenders buying, 88¼; selling, 89. Gold in New York to-day, 113¾.

Table of Contents.

ILLUSTRATIONS.—Remington's Breech-Loading Rifle. Page 1. A California Primrose, 6. Coast Surface and Scenic Geology, 9.

EDITORIALS.—San Francisco Enterprises—Our Sugar Refineries, 6. Vol. XXV, 8. Academy of Sciences, 9.

CORRESPONDENCE.—Heavy Mine Blasting in Dutch Flat; Observations of a Practical Miner; Hydraulic Mining with Slight Fall; The Eureka Grinder and Amalgamator, 2.

SCIENTIFIC PROGRESS.—Maple Sugar—Its Formation; Spectrum of the Zodiacal Light; Electrical; Artificial Water Lime; Vegetable Source of Carbolic Acid; Chemical Action in Porous Filters, 3.

MECHANICAL PROGRESS.—The New Mode of Conveying Compressed Air as a Motor; A New Invention; A New Building Material; Salts of Copper a Preventative Against Mould; Steel Rails; Chicago Concrete; Pigments for Coating Iron; Drying Lumber by Steam, 3.

MINING SUMMARY.—Reports from mines in various States, Counties and Districts; Stock Reports; Leather and Metal Markets; Mining Shareholders' Directory, 4-5.

USEFUL INFORMATION.—Composition of Patent Medicines; Screws Inserted in Plaster Walls; Varnish to Imitate Ground Glass; Old Rubber; Cocoa-nut Oil; Something About Anvils, 7.

GOOD HEALTH.—Weak Backs and Bad Seats; Clay Dressings for Variola; Fevers and Sewers; The Prevention of Small-Pox; Chapped Hands, 7.

DOMESTIC ECONOMY.—Real Lace—How to Wear it and How to Clean It; Strawberry Syrup; A Chapter on Eggs; Hygienic Bill of Fare; Good Harvest Drink; Cream Beer; How to Cook Potatoes; Uses of Paper; Selected Receipts, 10.

MISCELLANEOUS.—Monday as Pay Day, 3. Fossil Discoveries in Solano County; Changes in Lines of Freight Traffic, 6. Bullion Receipts for 1868-69-70 and 71, 9.

FOURTH OF JULY.—On account of the 4th coming on Thursday—a day on which we never mean to do much work if we can help it—this issue goes to press one day in advance of its usual time of publication.

VINE-GROWERS FAIR.—The Fair of the California Vine-Growers and Wine and Brandy Manufacturers Association, will be held in Sacramento in connection with the State Fair, commencing the 19th of September, and continuing until the 28th. Two thousand dollars is offered in premiums ranging at about fifty dollars each. By an advertisement in another column it will be seen that the association will hold a business meeting at Sacramento, on the 25th of July, and that the attendance of all interested is requested. All wine-growers should be present to assist in forwarding this great industry.

PLACERS.—A dispatch states that a company is now beginning a ditch on the placer mines commencing one and a half miles from Bakersfield, Kern county. The work commences six miles above town, and it is said that the bars and banks prospect well for some miles.

METEOROLOGICAL.—The mean range of the barometer for the mouth of June in this city was 29.99 inches; the mean temperature was 59°; the prevailing wind was from the southward; and the hottest day was the 21st, when the thermometer stood 79° in the shade.

COTTONWOOD CANON.—Thousands of tons of ore are being daily freighted from Little Cottonwood to smelters on the railroad since the opening of the wagon road.

Volume XXV.

With the present issue we commence a new volume, and again resume our former title of MINING AND SCIENTIFIC PRESS. The prefix of "MINING" was dropped some two years ago, in consequence of the large amount of agricultural matter which we thought best to give in answer to the earnest call for such information, from that portion of our readers engaged in farming. With the increased circulation of the PRESS, and the constantly increasing demand for agricultural information, we were subsequently induced to issue a special agricultural edition, and finally an independent journal which was started as the PACIFIC RURAL PRESS, and which still continues to represent the agricultural interests of the Pacific Coast, as the SCIENTIFIC PRESS does the mining interest. Under these circumstances it has been thought both proper and advisable to resume our mining prefix, which will hereafter be permanently retained.

It will also be noticed that we have been gradually changing the size of type for our reading columns—the bourgeois, heretofore used being replaced by brevier, which is a smaller type and which will admit of a very material increase to the amount of reading matter which we shall hereafter be able to give. It is also the intention of the proprietors to furnish more original engravings than heretofore. This we are enabled to do from the fact that the PRESS, within the last two years, has been greatly strengthened financially, and has become more widely known to the mining and scientific world, both on this continent and in Europe.

As a mining journal, in close communication with practical miners everywhere, and located in the commercial center of the most important mining region on the globe, we have the leading position, and intend to make the MINING AND SCIENTIFIC PRESS the leading mining paper of the world. To this end we have various improvements in view, which will be developed, from time to time, as circumstances may require.

The mineral resources of the Pacific Coast, great as they already appear in their unparallelled richness, remarkable variety and extent, and greatly as they have astonished the world, are yet only in the infancy of their development. With the improved appliances now being introduced, and the experience gained by over twenty years of labor and experiment, our people are now better than ever able to grapple with the difficulties and intricacies of mining. Our mills and machinery are built better and cheaper; mining explorations are carried on more systematically and more intelligently, and an increased confidence is apparent on the part of both the miner and the capitalist. Foreign capital and skill is rapidly coming in to take up and carry on to successful issue the incipient developments of our hardy and persevering prospectors; while furnaces of the most approved construction and management are rapidly multiplying all through the silver regions, to utilize the thousands of tons of ore which have heretofore presented but useless heaps of rubbish, or been left to rest in the hidden recesses of the mine for the lack of means and enterprise to extract therefrom the precious metals.

In addition to such precious metals, the unlimited quantity of coal, iron, copper, lead, etc., with which our mountains are known to abound, are also fast being brought to light and utilized. Lead is already beginning to form an important article of export, while our home needs are entirely supplied from our own mines.

With the improvement of business generally, and the late important advances in the price of iron and copper, attention is being once more turned to the production of those useful and important metals, which are found in the greatest profusion, and of the highest percentage in many localities on the Pacific Coast.

Discoveries of coal are also constantly being made, not only in the Coast Range, but all through the great interior basin between the Sierra Nevada and Rocky Mountains, and in many places in near proximity to the mines of the useful metals, or to our principal railroads, by which the two can be cheaply brought together for reduction and utilization.

With such a field before us, and in a community where every class of valuable industrial information is sought for with an earnestness no where else witnessed, it would be a matter of surprise indeed, if a journal, devoted to the great leading interest of the State, and to its mechanical and industrial pursuits generally, should not meet with a generous support and encouragement.

As heretofore, the miner will find in our columns, and carefully digested, every class of information which will be useful to him in his laborious and precarious calling. Increased attention will be paid to our mining summary and stock reports, and no effort will be spared to render the PRESS useful, instructive and advantageous to persons engaged in any of the industrial pursuits of the day. Early and full reports of new inventions and discoveries in art, and science will be given in our columns, and the most useful, practical information in all the industrial walks of life will be weekly summarized and placed before our readers. With these purposes well and truly carried out, we feel assured that our efforts will not be without avail or profit to our readers, in adding to their general stock of useful knowledge.

Our readers can be of great service in adding interest to the PRESS by furnishing us with such useful facts as may come under their observation. They can also largely aid in extending its circulation and usefulness, by calling the attention of their friends to its worth and importance, and by sending it abroad, to the Atlantic States and to Europe, to such persons as they may think would be interested in its perusal, or desirous of acquiring the class of information which its columns contain. No better paper can be found to send to the "old folks at home." It would be much preferred there to the papers filled with light or sensational reading which are usually sent. The commencement of a volume is a good time to subscribe.

With these remarks we enter upon a new volume, with renewed confidence that our labors will not only be fully appreciated but duly rewarded by a generous and appreciative public.

Bullion Receipts for 1868-69-70-71.

The weekly *Stock Report* of June 21, contains a tabulated statement of the yield of thirty-one mines, which are now in operation, which shows conclusively the wonderful advance in mining operations during the past few years. We annex a statement of the totals for the past four years, and would call especial attention to the large increase of 1871 over the previous year:

COMPANIES.	TOTAL. 1871.	TOTAL. 1870.	TOTAL. 1869.	TOTAL. 1868.

QUICKSILVER.—The New York *Tribune* of June 18th in referring to a new contract with the Quicksilver Company says:—"In the miscellaneous list there was a further break, despite the contract last night concluded between the New Almaden Quicksilver Mining Company of the first part, and Eugene Kelly & Co. of the second part, by which the former sell to the latter the entire product of the mine during the year ending April, 1873, for $50 gold per flask. Last year the company got for its quicksilver only $31 per flask, under a contract with the Bank of California. The product this year, it is estimated, will be about 25,000 flasks."

THE SAN FRANCISCO BRANCH MINT.—The Branch Mint in this city during the fiscal year ending June 30th, coined $18,745,500. Of this $17,400,000 were in double eagles; $198,000 in eagles; $127,000 in half eagles; $65,000 in quarter eaglee, making a total of gold coinage of $17,790,000. The silver coinage amounted to $955,500, of which $883,000 was in half dollars; $12,750 in quarters; $36,000 in dimes; and $23,750 in half dimes. This report shows a decrease of $75,000 in gold coinage from last year, and an increase of $204,000 in silver, making a total increase of $129,000.

List of Pacific Coast Patents.

The following re-issue is the only patent issued for Pacific Coast Inventors, for the week ending June 18, 1872:

CHAIN-ELEVATOR AND BUCKET.—John A. Ball, Grass Valley, Cal.—Patent No. 96, 866, dated November 16, 1869.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co's. MINING AND SCIENTIFIC PRESS, American and Foreign Patent Agency, the following are worthy of mention:

IMPROVED GRAIN CLEANER.—John H. DeForce, Healdsburg, Sonoma county, Cal. This grain cleaner is intended more particularly to be used in mills, for the purpose of thoroughly cleaning wheat previous to its being ground into flour. It consists of a peculiarly constructed pipe or spout, through which air is drawn by a fan. The grain is delivered into a vertical spout at the end of the spout or pipe opposite the fan, so that the chaff and lighter grains will be drawn by the suction produced by the fan, through the pipe, while the heavier and larger grains on account of their superior specific gravity, will fall upon a series of separating plates or screens where the chest and barley are separated from the wheat.

MACHINE FOR PAINTING WIRE CLOTH.—Samuel Graves, San Francisco, Cal. This machine is intended to be used for painting wire cloth, such as is manufactured in strips of considerable length and afterwards rolled in the manner of forming rolls of ordinary cloth. It can also be used for painting or coating any other fibrous material, such as cloth, where such a process is required. The usual manner of applying paint to wire cloth is by means of brushes, which renders the process very tedious, especially so as it requires great care to prevent the meshes of the cloth from becoming filled with the paint, where it will dry and not only injure its appearance but the utility of the cloth. In this machine the cloth is passed through a bath of paint or other mixture so that it will be covered, and afterwards passed between elastic rollers which will press out all the superfluous paint which has lodged in the meshes, and leave the wires with a proper coating of paint to protect them. The machine consists of a box in which the paint is kept; proper mechanism is provided for stirring the paint in order to prevent it from settling or becoming thick. India rubber or other elastic rollers are secured above this vessel so that the cloth can be carried up directly between them. Upon each side of these rollers are fixed hoppers or troughs which receive the superfluous paint which the rollers take from the cloth, and direct it back to the main vessel or tank.

The Text of Interesting Decisions in Patent Cases.

DECISIONS OF THE COURT.

BENJAMIN O. TILGHMAN vs. G. F. MORSE.—In Equity. Decision rendered February 17, 1872.

PATENT OF BENJ. C. TILGHMAN, FOR CUTTING AND ENGRAVING STONE, GLASS, METAL, ETC.—ANALOGOUS USE.

The process described in letters patent to George F. Morse, November 21, 1871, for an "Improvement in ornamenting and dressing glass and metal surfaces," held to be an infringement of the first claim of patent of Benj. C. Tilghman October 18, 1870, which is "the cutting, boring, grindiug, dressing, engraving and pulverizing of stone, metal, glass, pottery, wood, and other hard and solid substances by sand used as a projectile, when the requisite velocity has been artifically given to it by any suitable means."

The term "artificially," as used in this claim, covers the falling of sand through a vertical tube high enough to enable it to acquire sufficent velocity to do its work.

A party defendant manufacturing under his own patent held to infringe plaintiff's patent, notwithstanding he had in his specification disclaimed the invention covered by said plaintiff's patent.

Tilghman's invention consists in the discovery that a stream of sand driven with sufficient velocity to cause the grains of sand through their own momentum to act as projectiles against the articles to be cut or dressed, will do the work effectually without any vehicle to carry the sand into contact with the article, and without any contact between anything and the article except the sand.

Such invention held not to be anticipated by a process in which sand or emery was rubbed against the surface of the article to be cut or dressed, by means of the wires of a revolving wire brush; nor by the well-known fact that any solid or liquid material, falling continually upon any surface, would wear it away.

Held, also, not to be anticipated by the use on locomotives of a stream of sand combined with a jet of steam, to drive cows from the track. No one, from observing the temporary operation of the process on the animal, would infer that by the same means he could produce the results which plaintiff describes. There is no resemblance in kind between those results and the results produced upon the animal.

Coast Surface and Scenic Geology.

At the last meeting of the Academy of Sciences, held on Monday evening, July 1st, Amos Bowman presented and illustrated by blackboard delineations, several noteworthy points, defining and establishing recent remarkable geological changes. The process by which San Francisco peninsula, and the Contra Costa and Alameda hills and valleys become dry land, was shown to have been simple, gradual and commonplace, but to be still going on. It was not one of sudden violence. From the salt marshes to the mountain tops, everywhere, are found systematic evidences, in the loosened material, the gravels and sands on the surface of the older rocks, to which geological attention has hitherto been most particularly directed, of the ocean's presence in successive stages, and in very recent times. What were islands once among the hills and valleys of California, now farmed and populated, were traced, — and can be further traced by the reader, — by the following line of facts. We copy from several of the diagrams.

We may see with our own eyes, Mr Bowman remarked, the birth and creation of the coast counties and California valleys. The rock we rest upon on a Sunday excursion to SanBruno Mountain imparts to us in an hour its hoary wisdom, and our life (imaginatively) is made to begin with its experience. Mr. Bowman first drew a sectional view of San Francisco peninsula, to show the situation and significance of the San Francisco Pliocene hills. The scope and scenery of this section of country can be well studied (as remarked), from the older San Bruno mountains, a point easy of access in an hour from the city; but to get to the Pliocene hills themselves, that are, of course, under water from that island standpoint, one must go to School House station, and drive three miles along the Laguna road to the southwest.

FIG. 1. PROFILE VIEW OF S. F. PENINSULA, AS SEEN FROM DECOTO. LENGTH, 26 MILES.

Any one would on attaining the divide here, in full view of the Pacific, observe a peculiarity in the scenic outlines of the hills. The geologist suspects "a formation." A broad palpable plateau, yielding the Italian renter easily won potatoes, lies at your feet in the glory of the afternoon sun of the Pacific, tinctured by fairyland clouds in the far west.

All the highest hills, some 700 feet above the sea, within five miles radius of this point, are Pliocene. The abundant fossils in them, as determined by the Geological Survey, tell the story. They were of the period just preceding the creation of the species of mammalian animals now living, for the mammalians associated with the former are all of species extinct; that, in short, being what Pliocene means.

The San Francisco Pliocene and its subordinate terraces, down to the recent valley and the salt marshes of the sea of to-day, were next portrayed by a birdseye sketch, as they might be seen from a point half a mile in the air above Goat Island. The same can be recognized from Oakland wharf, or anywhere along the railroad thence to San Leandro, in a favorable afternoon light. What was most remarkable in this, was the testimony it bore of the exceeding regularity and simplicity of the movement upward, whereby the waters of the sea were caused to depart. The terrace lines showed unequal movement, though sagging a little about the road from San Mateo to Spanishtown, and southward rising again up into the redwoods near the summit of the peninsular ridge, opposite San José.

Wave-worn beaches and flats on the Mission hills overlooking San Francisco, show the continuations of the Pliocene sea levels to our very doors. The terrace in the San Bruno mountains which gives scenic individuality, in the soft blue distance as seen from San Francisco is not as might be expected, of detrital material, but of rock as hard as the Pliocene. It appears to be a terrace of marine abrasion, rather than of subaqueous deposit and to belong to the older day of the San Bruno mountains, the Cretaceous. Only fossils, or a study of continuations of formation, can tell us the truth in such a case.

The remaining peculiar surface and scenic features of the vicinity of San Francisco are found in the channels of subaqueous erosion, like that continuing from the Mission Dolores through the New Park to the ocean. These were minor Golden Gates when our city hills and Lone Mountain were Alcatruzes, long after the close of the Pliocene. It is an open question whether the elongated and level sandy benches, similar to that found on the north side of Lone Mountain, half way to its top, are ascribable to Neptune or Ventosus.

What is told of themselves by the hills of Alameda, Livermore Valley and the Diablo range in general, in this connection, embracing the history of the San Joaquin and Sacramento valleys, was further dwelt upon, and discussion followed, in the course of which Prof. Davidson, Mr. Stretch and Prof. Bolander contributed interesting facts. The substance touching continuations into the interior will be alluded to next week.

Academy of Sciences.

The regular semi-monthly meeting of the Academy was held July 1st, Professor Davidson in the chair. Messrs. Benjamin Smith, Jas. R. Findlayson and Alexander Austin were elected members of the Association. A number of plants and a collection of minerals from Pioche, Nev., were received from F. E. Durant. A short paper on the

Silver Mines of Pioche

Accompanied the latter donation. The mines are situated in veins running in an easterly and westerly direction. The veins are of different characters. The Meadow Valley, Pioche, Raymond & Ely and Washington & Creole appear to be in veins with a bifurcation or two veins crossing each other. This was explained with a diagram. Higher in the hills are two other veins about 18 feet apart. Their general direction is also east and west. On these second veins are situated the American Flag, Arkansas, Chapman, Huhn & Hunt, Desdemona, Ivanhoe, etc. Further east is the vein of Peavine, running north and south. All these veins are enclosed between walls of very hard stratified quartzite which is generally colored by peroxide of iron. The veins, which are nearly vertical, cut the stratification at right angles; but the convulsions which have produced this fissure have lifted one side, as the planes of stratification do not correspond across the vein. In some places the quartzite is covered by micaceous slate, which lies in inconformable stratification.

Here this slate is a very thick formation of stratified crystalline magnesian limestone. The line of contact of the slate and limestone contains a great amount of metallic oxides (iron and manganese,) hematites, manganite, pyrolusite, etc. The silver veins of Pioche are generally very regular. They are encased in hard rock, requiring very little timber, and there is no water in the mines. The deepest worked mine is about 500 feet below the surface. In the superior parts, the ores are chloride of silver mixed with crystalline quartz, but generally the ores are carbonates of lead containing silver, (very likely in the state of sulphuret of silver.) The oxide of iron of a light yellow color is common. In some places, as in the Burke mine, the ore is chiefly galena, and sulphuret of lead. In the deep works of the Meadow Valley, malachite is abundant. In all these mines the gangue is quartz but the oxidation of the metallic sulphurets has destroyed its cohesion, and this quartz is now very easily crushed. A specimen of

Yerba Buena

Was received, which the donator said was called in Washington Territory, wild tea. The Indians say it is excellent for the blood, and speak of its virtues in glowing terms. The hunters say they frequently make the tea to drink when out on long hunts, and that it invigorates them wonderfully. It is also said to be an efficient cure for cancer. Dr. Stout and Prof. Bolander both said it was the common Yerba Buena, from which this city took its old Spanish name; and that its medicinal virtues had long been recognized. R. E. C. Stearns then read a very interesting paper "on the economic value of certain

Australian Forest Trees

And their cultivation in California." It treated particularly of the varieties of the Eucalyptus which Mr. Stearns eulogized as particularly adapted to California. We will give this paper in full in a future issue. The reading of the paper drew some of the members out in a discussion concerning the merits of the tree and its proper cultivation, strength, value as timber, medicinal virtues, etc.

Professor Bolander said that a familiar instance of the applicability of trees in tempering climate might be noticed when coming from the Eastern side of the valley towards Sacramento and Stockton. While in the valley the wind was hot and uncomfortable; on nearing Sacramento or Stockton the traveler became conscious of a refreshing coolness, caused by the existence of trees at those places. He had put a thermometer in the open air on a warm day, and then placed it on the green leaves of a tree, and it showed a difference of eighteen or twenty degrees. If our grain fields were surrounded by trees they would be greatly benefitted.

Professor Davidson said that this fact was recognized in Iowa, where they set aside one day in the year to plant trees for that purpose, generally the 1st of May, and that on that day last year it was estimated that upwards of one million trees had already been set out.

Dr. Stout testified to the hardihood of the Eucalyptus. He also said that parasites did not attack it, on account of the odor. As to the medicinal qualities of the tree, he had taken a quantity of the leaves and made cigarettes of them, and had constructed also a respirator so that the fumes from the leaves might be inhaled, and had found it of great assistance in cases of sore throat and chronic asthma. For the latter particularly it was very effective and will afford ready relief in case of an acute attack. He had strewn the dried leaves in the basement of houses where there were bad odors, and had found it almost as useful as carbolic acid.

Professor Bolander said that the idea was erroneous that the Eucalyptus was fragile and would not stand. The plant should be bought young for transplanting. These trees should be planted at least during the first year of growth, and they will take root and not be easily overthrown. When kept in pots too long, the roots become deformed; this is the reason why some people think they will not grow. The easiest and best way to cultivate these trees is to take a box filled with sandy soil nearly to the top and the remainder covered with sawdust; wet the sawdust slightly, throw the seed over it and gently rap the box with the hand. Keep this under a piece of paper or in the shade and when the seeds sprout they can be taken out like a small cabbage plant and set out at leisure.

Dr. Stout said they should not be supported by a rod or stick placed to close to the trunk since it prevented the branches from growing on the side where the support was.

Mr. Stearns said that when the plants were placed in a pot the tap roots assumed a rotary direction, and when taken out and planted the trees were easily overthrown.

Professor Bolander said the trees should be allowed to grow naturally and the lower branches should never be cut off. At Gen. Naglee's place in San José where he has raised about 60 acres of trees of all kinds the pruning knife is never used.

A twig containing the cells of a sort of scale insect was received from Menlo Park. It destroys the acacia and other plants in that vicinity.

The Humboldt Divide.

Dr. Blake stated that in a recent visit to the northern part of Humboldt, in Nevada, he had been able to corroborate the statement he made at the Academy a few weeks ago, as to the position of the divide between the waters of the Great Basin and the Columbia river. He had found it as before stated, some 50 or 60 miles further south than it is at present located on our maps. Not having any means of determining the exact latitude or longitude he was unable to give the exact geographical position of the divide, but computation from the nearest point, Fort Smith, the position of which had been astronomically ascertained would place it about in latitude 41° 40′ south and longitude 117° 53′ east.

The divide was found to be higher than he had thought, before actual measurement. Although the barometrical measurement had not yet been calculated, yet he believed the hight of the divide would be from 450 to 480 feet above the level of the Humboldt Valley, on about the same meridian. From the northern side of the divide, the water all flowed north, and although they did not directly reach the Owyhee, a tributary of the Columbia, yet there was no marked divide between the flats where they were last, and the streams flowing directly into the Owyhee.

Mr. A. Bowman of the State Geological Survey, then gave a slight sketch of Coast Surface Geology, which he illustrated with diagrams on the Board. His remarks will be found in another column.

Among the donations to the library, was volume I, of the "Zygaenidae and Bombycidæ of North America, north of the Mexican Boundary" by Richard H. Stretch. There will be about twenty-five or thirty of these pamphlets, containing handsome colored plates. The author asks that those who are willing to assist the work by the loan of rare species for figuring, put themselves in communication with him, and they will receive ample credit for such services. This work, which will be issued in numbers, about one in six weeks, will be a rare one for entomologists. The letter press is fine, and the colored engravings well executed.

The Missing Stars.

Professor Davidson remarked, that his statement as to the stars, which were said to be missing or decreased in brilliancy, had been denied by several. On June 21st, and several subsequent evenings, he had found them in their usual places, and of the proper magnitude. He said, that Mr. Madeira reiterates, that *Eta Leonis* is now of the 6th magnitude, but it is plainly visible to the naked eye as a star of the third and a-half magnitude. If he has observed it instrumentally, his instruments cannot be in adjustment. Mr. Clarke, who reported the disappearance of *Mu Lennis*, has instrumentally satisfied himself, that he is in error, into which he was led by a poor atlas of the heavens.

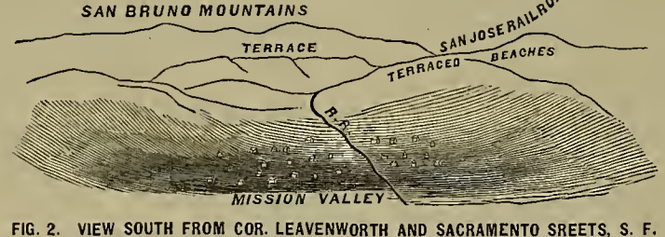

FIG. 2. VIEW SOUTH FROM COR. LEAVENWORTH AND SACRAMENTO SREETS, S. F.

A LARGE and rich body of ore has been struck in the Gladiator tunnel, near the Emma mine.

DOMESTIC ECONOMY.

Real Lace—How to Wear it and How to Clean It.

It has beeu said that women will fall down and worship a hit of dingy lace. Men wonder why ladies, dainty as regards the cleanliness of every other article of dress, will wear lace which is, to say the least, yellow, if not positively soiled. *Point d' Alencon*, one of the most beautiful and costly of the lace family, has a dingy appearance, even when new—the dirt appearing to he in the thread itself. This doubtless arises from the fact that it is slowly made, from handspun thread, and the poor lace-makers weave into it the sweat of their fingers, if uot of their hrows.

The fashion of diugy or yellow lace is one of ancient origiu. In the days of Elizaheth, immense lace ruffles were worn at the neck aud wrist, the lace heing generally handed down from one generation to another. To have old lace, was to have an ancient lineage. Of course, the yellow tinge of age was not to be bought by parvenus, and to have washed one's lace, forsooth! would have been to take away its prestige entirely.

But doubtless the fashiou has another reason for its origin. The moment the delicate meshes are wet the tiny threads shrink and the lace "fulls" more or less. I have heard ladies say that they could not do up lace to look "just like new." Now, this very fact of shrinkage proves that it cau not he done by any hut a "professor." The art of washing fine and costly lace is a trade in itself. It is spread, while wet, upon a cushioued table, and, after being pulled smooth, a piu is stuck into every mesh, to preveut shrinkage, a whole day sometimes spent npou a siugle yard of lace. When ladies can do that they can perhaps do up lace to "look just like uew." I once knew a lady, possessed of a rare collection of valuable laces, and also a rare passion for them, who washed and pulled them until they were dry, and then, slightly oiling some fine writing-paper, pressed the lace hetween the folds of it for several days. Of course she had not much else to do, and the lace, especially the *Valenciennes*, did really look beautiful, hut it did uot look new after all, and lacked the spirit-like delicacy of that which has never heen wet.

There is no finish so perfect to a lady's attire as a set of lace collar aud cuffs. One should wear linen in the morning to be sure, the pure whiteness and *washableness* harmonizing well with the plain print or merino morning-dress. But for full-dress, one must have lace, fine and clear, hoth for heauty and fashiou. To wash it is to spoil it. To throw it away as soou as it has hecome soiled—well, ouly people who wear diamonds at breakfast can do that; while to wear it positively dirty with oil from the hair or neck, is to forfeit the respect of all whose good opiniou ie worth having.

But there is a way out of this dilemma both easy aud feasihle. If a box of powdered magnesia he kept at hand, and the laces thrown in and covered as soon as they are taken off, and kept there until thoy arc wanted again, they will come forth as clean and fresh as could he desired. The magnesia can all he removed by boating the lace across the hand. Lace which has become much soiled by loug use may be cleaued in this way so as to be quite presentahle over a dark dress; only, it must he thorougely rubbed with the magnesia.

Lace-mending forms a separate branch of industry in Europe; as distinct, if not as widely followed, as lace-making. Like that, the trade must ho learned, for tho delicate meshes and pattern must all be restored. Ladies of rank often employ lace-meuders to teach them their art—that being, I suppose, as fascinating an employment as embroidery. Charlotte Bronte, in "The Professor," makes her heroine a lace-mender.—*Hearth and Home.*

Strawberry Syrup.

Somehody recommends the following as a very excellent preparatiou from strawberries: Take two pounds of nice herries, all the green ones being carefully picked out, and put them into a large hottle with a wide mouth, and at the eame time two aud a half pounds of finely pulverized white sugar. The hottle should not he quite full. Thoy are to he left standing at the ordinary temperature, being occcasionally gently shaken np. The sugar takos up the liquid part of the berry, forming a clear, aromatic syrup, while the solid parts shrivel np almost odorless and tastless, and may ho easily separated by straiuing through a linen cloth. Milk or wine may he poured over the residue to make a palatahlo dish for the table. The ahove quantity of berries and sugar make one aud a half quarts of syrup. It may he kept for some time in closely stopped hottles in a cool place. It must not be heatod, because the flavor of the berry is very volatile; a long exposure of the juice to the air is also injurious. The syrup, diluted with water, makes au agreeahle ico; or it may he mixed with some light wine as a drink. Raspherry syrup may he prepared in the eame way. The flavor of the raspberry is not injured hy heat, and the syrup may he more quickly prepared and with less sugar hy placing the bottle for a short timo in boiling water. This syrup may also be used for ices. As a drink, whon diluted with water, it is less piquant than that made in the usual way by crushing tho herries and letting the juice stand for a week.

A Chapter on Eggs.

Would it not he wise to suhstitute more eggs for meat in our daily diet? Ahout one-third the weight of an egg is solid nutriment. This is more than can be said of meat. There are no bones or tough pieces that have to be laid aside. A good egg is made up of ten parts of shell, sixty parts white, and thirty parts yolk. The white of an egg contains eighty-six per cent. of water, the yolk fifty-two per cent. The average weight of an egg is two ounces. Practically an egg is animal food, and yet there is none of the disagreeahle work of the butcher necessary to obtain it. The vegetarians of England use eggs freely, aud mauy of these men are eighty and ninety years old, and have been remarkahly free from illness. A good egg is alive. The shell is porus and the oxygen of the air goes through the shell and keeps up a sort of respiratiou. An egg soon hecomes stale in bad air, or in dry air charged with carhonic acid. Eggs may he dried and made to retain their goodness for a long time, or the shell may he varnished, which excludes the air, when, if kept at a proper temperature, they may he kept for years. The French produce more eggs thau any other, and ship millions of them to England annually. Fresh eggs are more transparent at the center, old ones on the top. Very old ones are not transparent in either place. On water in which one-tenth of salt has heen dissolved, good eggs sink, and indifferent ones swim. Bad eggs float in pure water. The best eggs are laid hy young healthy hens. If they are properly fed the eggs are better thau if they are allowed to eat all sorts of food.

Eggs are best when cooked about four minutes. This takes away the animal taste that is offensive to some, but does not harden the white or yolk as to make them hard to digest. An egg if cooked hard is difficult of digestion, except by those with stout stomachs; such eggs should be eaten with hread and masticated very finely. An excellent sandwich can he made with eggs and brown hread. An egg spread on toast is food fit for a king, if kings deserve any hetter food than anybody else, which is doubtful. Fried eggs are lcss wholesome than boiled ones. An egg dropped into hot water is not only a clean and handsome hut a delicious morsel. Most of the people spoil the taste of their eggs hy adding pepper and salt. A little sweet hutter is the hest dressing. Eggs coutain much phosphorus, which is supposed to he useful to those who use their brains much.—*Herald of Health.*

Hygienic Bill of Fare.

BREAKFAST.—Brown hread, wheaten gems, corn-meal gems, huttter, sugar, cracked wheat, mush, milk, tomatoes, baked apples, baked pototatoes, sweet potatoes.

DINNER.—Roast heef, potatoes, squash, string-beans, tomatoee, hrown hread, butter, cold gems, apples, and grapes.

SUPPER.—Wheat-meal gruel, sugar, milk, brown bread, hutter, cold gems, graham cake, stewed apples.

By wheat-meal is meant unbolted wheaten flour. Cracked wheat is the same, very coarsely gronud.

Water is placed on the table at noon, but no drink at breakfast or supper. Eastern watercures generally furnish no meat.

GOOD HARVEST DRINK.—Mr. Blair Burwell, of Powhatan, communicates to the Southern *Farmer* the following recipe for a harvest drink: Water, 33 gallons; Sharp Vinegar, 1 gallon; Molasses, 1¼ gallons; Ground Ginger, ¼ lb.

This will last thirty hands until dinner time, when as much more may be mixed up to serve until night. It is carried to the field daily in a cart, and moved abont after the hands, each oue of whom ie limited to a cocoanut full at a time, always without ice—(they drink nothing else.)

For our part we see no harm in ice. We have used it regularly for fourteeu years with out any bad result, but ou the contrary, we thiuk with benefit.

We know persons who have used it beneficially for a still longer period. A venerable friend of ours, recently deceased, assured us that he had nsed it thirty years or more, and never without advantage. His plan was too carry out a barrel of ice on a cart, and keep the water tuhs nearly filled with it. His theory, and we helieve the true one, was, that the ice acted as a tonic; and the hands could never drink to distention.

Strong coffee should always be given at breakfast aud at night.

CREAM BEER.—As the warm weather is now upon us we begin to think of refreshing drinks. I have a famed receipt which I give. It is an effervescing driuk, hut far pleasanter than soda water, inasmnch as you do not have to drink for your life to get your money's worth, the effervescence being much slower. Two ounces tartaric acid, two pounds white sugar, the juice of one lemon, three pints of water. Boil together five minutes; when nearly cold, add the whites of of three eggs well beaten, with half a cup of flour and half au ounce of essence of wintergreen. Bottle and keep in a cool place. Take two tahlespoonfule of this syrup for a tumbler of water, and add one-quarter of a teaspoonful of soda.—*Household.*

How to Cook Potatoes.

BAKED POTATOES.—Potatoes are more nutritious baked than they are cooked in any other manner; and they relish better with those who have not heen accustomed to eat them without seasoning. Wash the potatoes clean, but do not soak them. Bake them as quickly as possihle, without burning in the least. As soon as they are done, press each potato in a cloth, so as to crack the skin and allow the steam to escape. If this is omitted, the hest potatoes will not be mealy. They should be brought immediately to the tahle, as they will soon become solid and lose their flavor.

STEAMED POTATOES.—Potatoes are much more nutritious and palatable if they are properly steamed, than they are boiled. Wash them clean and place them in a steamer over boiling water. If the potatoes are of a good quality, the secret of having them mealy and palatahle is in steaming them very rapidly—as without a rapid condensation of steam aud a detention of steam in the steamer hy a close lid, the potatoes will he hard and appear not to be done, however long they may have been cooking. They should steam until the skin cracks, aud a fork will easily penetrate the centre. If not to be brought to the tahle soon, they should continue to steam until wanted, as steamed potatoes become solid much sooner than hoiled ones do.

TO BOIL POTATOES WITH THE SKINS ON.—After the potatoes are properly washed and a little of the skin taken off at the ends, place them in a kettle of hoiling water, allowing no more water than is sufficient to cover them. They shonld boil slowly, as the agitation of water in rapid boiliug dissolves and breaks the potatoes before they are done, and leaves them insipid and moist. They are better left unmoved to boil, and there should always be a vessel of hot water, from which the kettle may be replenished in case there is rapid evaporation from the state of the atmosphere. A pot with the top drawn in is hetter for hoiling potatoes than a wide-topped vessel. The water should be poured from them before they are quite done to the centre. A few spoonsful of cold water should then be added, and the vessel be placed upon the hot part of the stove with a clean napkin thrown over until the potatoes are wanted.

If the best potatoes cannot he ohtained (and no others are really fit to eat,) wheu about half done pour off the water; add cold water, bnt not enough to come to the top of the potatoes, and finish boiling and steaming them off as before. A close cover should never be placed over potatoes after cooking, either in the kettle or upon the table. After potatoes are ahout half boiled, for variety they are very nice finished off in the oven, either with the skine on or after removing them. They will need hut a short time to bake in this manner.—*Herald of Health.*

USES OF PAPER.—Few housekeepers are aware of tho many usee to which waste paper may he put. After a stove has heen blackeued it can be kept looking very well for a long time by ruhhing it with paper every morniug. Ruhbing with paper is a much nicer way of keeping the outside of a tea-kettle, coffee-pot and tea-pot hright and clean than the old way of washing them in suds. Ruhbing with paper is also the best way of polishing knives and tin-ware and spoons; they shine like new silver. For polishing mirrors, windows, lamp-chimneys, etc., paper is hetter than dry cloth. Preserves and pickles keep much better if brown paper, instead of cloth, is tied over the jar. Canned fruits are not so apt to mold if a piece of writing paper, cut to fit the cau, is laid directly on the fruit. Paper is much better to put under a carpet than straw. It is warmer, thinner, and makes less noise when one walks over it. Two thicknesses of paper placed between other coverings on a bed are ae warm as a quilt. If it is necessary to step upon a chair always lay a paper upon it, and thns eave the paint or woodwork from damage.

Selected Receipts.

RASPBERRY JAM.—Let the raspherries he thoroughly ripe. Mash them with a wooden spoon. To every pound of raspherries add a pound of sifted sugar. Boil this well together during half an hour, stirring it continually, lest it should hurn. When of a good thickness, put it into pots, let it cool thoroughly, and cover with brandied paper.

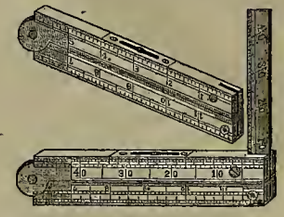
BLACKBERRY JELLY.—Gather the fruit when perfectly ripe, and in very dry weather. Put the blackberries into a jar and place the jar in hot water, keeping it hoiling until the juice is extracted from the fruit. Pass it through a fine sieve or jelly-hag without much pressure. For every pint of juice add fourteen ounces of sugar and hoil in a clean preserving-pan ahout five minutes, carefully taking off the scum as it risee to the surface. Place it hot in small jars and cover it down with thin tissue-paper, dipped in brandy, and brown paper over it. Keep it in a cool, dry place.

APPLE TAPIOCA.—Pare and core fine apples, place them in a deep pudding dish, fill the openings where the core was removed, and sprinkle thickly over the apples with white sugar. Have a dessert spoonful of tapioca soaked in water for each apple; and a little salt, and place this about among the apples; fill np with water to the top of the apples, and bake until the apples are soft and delicately-browned, but not until they have lost their shape Eat cold, with cream or a soft custard.

STEPHENS & CO.,

MANUFACTURERS OF

U. S. STANDARD BOXWOOD AND IVORY RULES.



ALSO EXCLUSIVE MANUFACTURERS OF

L. C. Stephens' Patent Combination Rule.

This cut represents the COMBINATION RULE, which comprises a Foot Rule, Spirit Level, Try Square, Bevel, Plumb, Slope Level, Etc.

It is made of the very best quality of Turkey Boxwood, besvily hound with brass, and is graduated with mathomaticsl accuracy.

The Square is adjustable, and can be tested and made perfectly true by the aid of a small screw-driver, but this is seldom required.

In its application as a Slope Level it is especially adapted for Miners' use, as it shows the PITCH TO THE FOOT, and DEGREE OF INCLINATION at once. It is six inches long when folded, hy one and three-eighths wide, and three-eighths inches thick, the cut being just one-fourth size.

"By the use of one of these, a huildsr. mason, carpenter, or other workmen, can always have in his pocket the most valuable of his apparatus used in construction, combined in a portable, useful and cheap form."—*Scientific American.*

BURLEIGH
ROCK DRILLS
AND
AIR COMPRESSORS.

The Burleigh Rock Drills, which have stood the test of five years constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequalled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunnelling, Sinking, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground, or compressed air when under ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being applied.

The California Powder Works
No. 314 CALIFORNIA STREET,
SAN FRANCISCO.
Manufacturers and have constantly on hand
SPORTING,
MINING,
And BLASTING
POWDER,
Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.
We have been awarded successively
Three Gold Medals
By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.
We also call attention to our
HERCULES POWDER,
Which combines all the force of other strong explosives now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other compound now in use.
A circular containing a full description of this Powder can be obtained on application to our Office.
16v20-3m JOHN F. LOHSE, Secretary.

H & L AXLE GREASE.

TRADE MARK H&L AVOID IMITATIONS

The attention of Teamsters, Contractors and others, is called to the very superior AXLE GREASE manufactured by
HUCKS & LAMBERT.
The experience of OVER TWENTY YEARS, specially devoted to the preparation of this article, has enabled the proprietors to effect a combination of lubricants calculated to reduce the friction on axles, and thus
Relieve the Draft of the Team,
Far beyond the reach of any who have but recently gone into the business; and as the H & L AXLE GREASE can be obtained by consumers at as
LOW A RATE
As any of the inferior compounds now being forced upon the market by unprincipled imitators, who deceive and defraud the consumer.

The Mining and Scientific Press for 1872 is Still Marching Onward!

Our careful system of compiling, judiciously condensing, and conveniently arranging into regular departments, has been heartily endorsed. It renders the paper worth more to readers, who can find handily that which interests them most. This plan will be continued in Volume XXV.

The weekly issues of the PRESS will contain reliable

Information for Practical Miners,

Treating on the Opening of Mines; Mining of Ores; Milling of Ores; Smelting of Ores; Separation and Rossting of Ores; Amalgamation; Saving of Gold and all precious Metals; New Processes of Metallurgy; New Discoveries of Mines; Mining Engineering and Hydraulics.

For Inventors, Mechanics and Manufacturers.

All ucw and importaut developmente in Scientific aud Mechanical Progress; Patents and Inventions of the Pacific States; Progress of Home Industries; Hints for Local Manufacturers; Illustrations of New Machinery; Reports of Popular Scientific and Industrial Lectures.

Our Mining Summary

Gives the progress of mining work from week to week in the various counties and districts throughout the principal mining regions of the United States, arranged in alphabetical order. It is the most extensive record of mining operations published in the world. It affords the intelligent miner a rare opportunity to know and profit by the work and experience of his neighbors. Miners have few sources of practicsl information in their calling, and should embrace every reliable means for improvement. Mining Operators and Shareholders, at home and abrosd, weekly examine our Summary with increased interest and profit.

For Self-Improvement,

Every issue of the PRESS abounds with articles of an elevating character, to stimulate the higher virtues and natures and progressive intellects of both men and women.

Our "Domestic Economy"

Embraces new and important facts which ehould be known in every csbin and household. Short and interesting—the articles under this heading are freely read and practiced with profit and improvement to the readers.

The PRESS is not strictly a "paper for professional, scientific men," but rather a

Liberal and Popular Scientific Journal,

Well calculated to make practically scientific men from our intelligent masses. This is our stronghold for accomplishing good. Plain, correct and pleasing language, easily comprehended by all, confined mostly to short articles, is our endeavor.

The New and Novel Developments

In the progress of this comparstively new section of the Union (but recently settled and now rapidly increasing with a population of the most intelligent and venturesome people, attfacted from nesrly every quarter and clime on the globe), enable us, with due enterprise, to display vigor and freshness in our columns not met with in similar journals elsewhere. The same circumstances also render such a paper more especially valuable to its readers in a new, and to a certain measure, untried field, where the best methods and processes of industry are not so well established or traditionally known as in older communities. Published experiences often save costly exporiments and disastrous results.

Hundreds of Dollars

Are oftentimes saved to the readers of this paper by a single hint or article of information in its columns. Such instances have been repeatedly reported to the editors and proprietore during their long connection with the PRESS. Our paper presents

A Great Variety of Industrial Information,

In brief and fresh form, suited to the wants and tastes of the readers of thia coast, which ia not obtainable otherwise so timely, or in so cheap and convenient form. As an industrial publication, meeting the wants of so many kinder industries, this journal stands preeminent and without a precedent.

Subscriptions payable in advance—$4 per annum Single copies, post paid, 10 cents. Address

Forwarded by mail, in cloth, $11.40, currency; in leather, $13.75. Issued and for sale by DEWEY & Co., Patent Agents and Publishers Mining and Scientific Press, S. F.

MARAVILLA COCOA.—No breakfast table is complete without this delicious beverage. The *Globe* says: "Various importers and manufacturere have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success had been achieved until Messre. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocos. Adapting their perfect system of preparation to this finest of all specics of the Theobroma, thoy have produced an article which supercedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homeopsths and invalids we could not recommend a more agreeable or valuable beverage" Sold in packets only by all grocers, to whom also may be had Taylor Brothers' Original Homeopathic Cocoa and Soluble Chocolate Steam Mills—Brick Lane, London. Export Chicory Mills, Bruges, Belgium. jun29-5w

State University.—The next term of the Preparatory Department will begin April 20th, 1872.

The course of study embracee the Ancient and the Modern Lengusges and the higher Mathematice, and ie specially adapted to the University curriculum.

Terms, $12 a term. GEORGE TAIT, Oakland. 13v3bp-tf

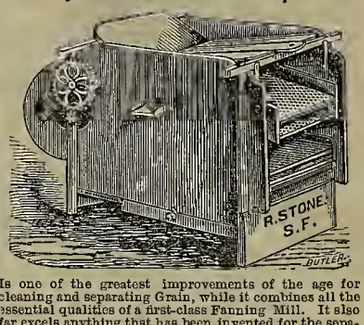
THE PATENT

Novelty Mill and Grain Separator



Is one of the greatest improvements of the age for cleaning and separating Grain, while it combines all the essential qualities of a first-class Fanning Mill. It also far excels anything that has been invented for the separation of Grain. It has been thoroughly teeted on all the different kinds of mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.

"HOADLEY."

TREADWELL & CO.,
SAN FRANCISCO,
Are the only Agents for Sale of these Engines in the Pacific States.

"THE HOADLEY"

Is the perfection of the Portable Engine. They are known throughout the Pacific States, and are justly noted for their Efficiency and Perfect Workmanship. We have them with and without wheels, and take pride in commending them as

Threshing Engines,

In which field they have long led all others—and for general use. Beware of Cheap-made Imitations, with their boilers imperfectly stayed, and made of second quality material. Better take a "HOADLEY" at double the price, and know your Life and Property are secure. No man who values either, can afford to buy any other, as hundreds can testify throughout California. Ask any man who has a Hoadley Engine, what he thinks of it.

Address

FROM 3 TO 40 HORSE POWER.

"Clear as Crystal."

PEBBLES ARE MADE from Rock Crystal cut in slices and ground convex, concave or periscopic, for Spectacles. In Europo and in the Eastern Statee they are superceding glass.

Among the advantages they have over glass are, that being susceptible of the HIGHEST POLISH, they transmit more rays of light, nothing having more transparency.

They are COOLER to the Eyes—a very important gain.

They are much harder than glass, and DO NOT SCRATCH.

The best quality of Crystal is found in Scotland and the Brazils, and is manufactured into lonses by the best workmen in England and France, for

Thomas Houseworth & Co.,

OPTICIANS,

No. 9 Montgomery street, Lick House,

Where they can be obtained, already fitted, in frames, or may be fitted to order.

Persons sending their Spectacles can have Pebbles inserted of the same grade as their glasses.

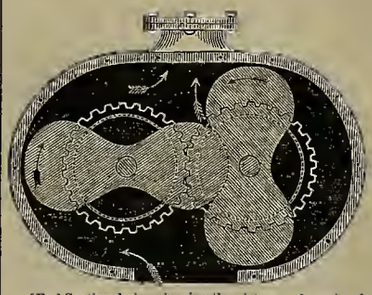
ROOT'S PATENT FORCE BLAST ROTARY BLOWER,

MANUFACTURED AT THE

GLOBE IRON WORKS,

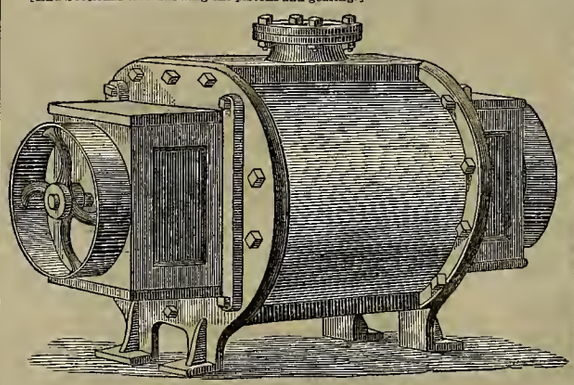
Stockton, Cal.



[End Sectional view showing the pistons and gearing.]

Awarded the First Premium at the Paris Exposition.—Patented November 1, 1864; July 24, 1866; and October 9, 1866.

Adapted for Smelting, Foundry, Mining and Steamships. Requires 50 Per Cent. less power than any Blower now in use.



One of these Blowers may he seen at W. T. Garratt & Co.'s Brass Foundry, San Francisco; Gould & Curry and Savage S. M. Co.'s, Nevada; and at C. P. R. R. Co.'s Works, Sacramento; and other places on this coast.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article. Quartz, Saw and Grist Mill, Iron, Stationary and Steamboat Engines, Horse-Power and Pumps, of all Sizes.

Machinery.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will he spared, to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco.

McAFEE, SPIERS & CO.,

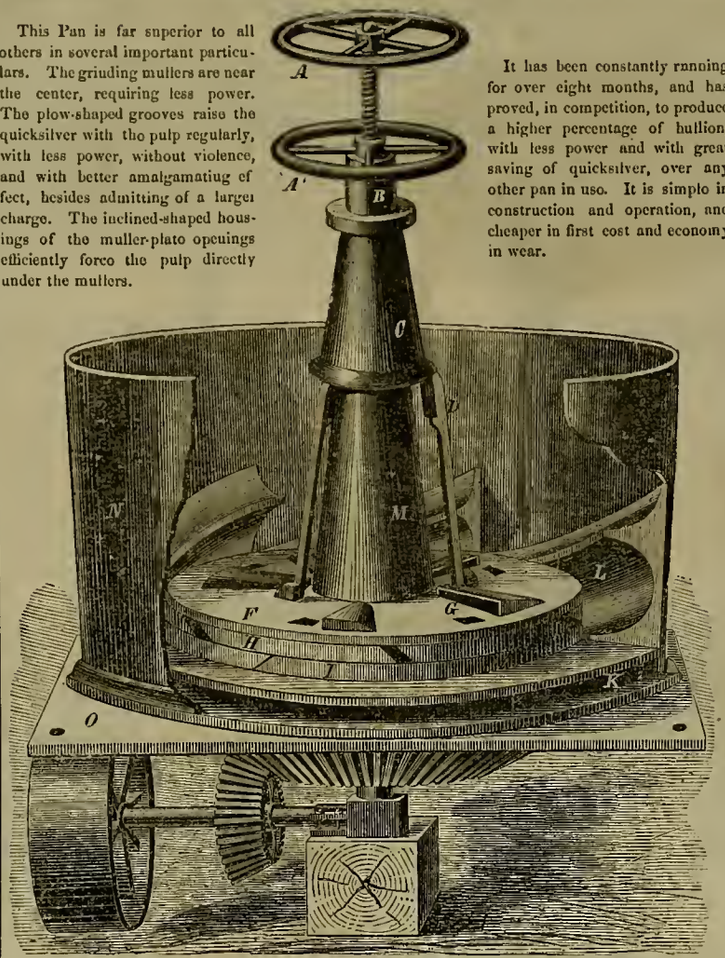
BOILER MAKERS

AND GENERAL MACHINISTS,

Howard st, between Fremont and Beale, San Francisco.

STEVENSON'S PATENT MOULD BOARD AMALGAMATING PAN.

This Pan is far superior to all others in several important particulars. The grinding mullers are near the center, requiring less power. The plow-shaped grooves raise the quicksilver with the pulp regularly, with less power, without violence, and with better amalgamating effect, besides admitting of a larger charge. The inclined-shaped housings of the muller-plate openings efficiently force the pulp directly under the mullers.



It has been constantly running for over eight months, and has proved, in competition, to produce a higher percentage of bullion, with less power and with great saving of quicksilver, over any other pan in use. It is simple in construction and operation, and cheaper in first cost and economy in wear.

Manufactured at the Golden State Iron Works (Co-operative). 19 First street, S. F.

Where it can be examined and further particulars be learned; or persons may apply to the inventor and patentee, Mr. C. C. STEVENSON, at the Douglas Mine, Gold Hill, State of Nevada, where the Pans have long been in constant operation. 15v20-1mr, 1amtf

PHOTOGRAPHIC GOODS, ETC.,

512 and 514 Washington street, SAN FRANCISCO.

We would call the special attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our large and well adapted stock of

ASSAYERS' MATERIALS

—AND—

Chemical Apparatus,

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast.

WE ENUMERATE IN PART:

Assay Balances—L. Oertlings, London.
Assay Balances—Becker & Sons, Antwerp.
Chemical Balances—Becker & Sons, Antwerp.
Ore or Pulp Balances—Becker & Sons, Antwerp.
Assay Weights—Grains and Grammes.
Bullion Balances and Weights.
Humid Assay Apparatus.
Iron Furnaces—Improved, Lined with Fire Brick for Cupelling and Melting.
Tongs, Muffles, Cupel Moulds, Assay Moulds, Scorifiers, Roasting Dishes, Annealing Cups, French Clay, Assay Crucibles, Hessian (or Sand) Crucibles.
Dixon's Celebrated Black Lead Crucibles and Covers—all sizes.
Assayers' and Chemical Glassware and Assayers' Hardware—a full assortment.
Steel Stamps for hair cut to order.

ACIDS AND CHEMICALS.

Acid in carboys and bottles, commercially and chemically pure.
Bi Carb. Soda, Borax, Bone Ashes, Litharge.
Assay Lead in bars, rolled and granulated.
Black Oxide Manganese, Sodium and Sodium Amalgam, Sulphate of Copper, Quicksilver, and all Chemicals and Reagents required by Assayers and Milling Co.'s.

☞ Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in Grains and Grammes, will be sent upon application.

ONE DOLLAR A YEAR
— FOR THE —
PACIFIC COAST

Mercantile Director.

This is a new 16-page monthly newspaper, of special information for wholesale and retail tradesmen. It will also contain reading of interest and importance to all business and professional men on the coast.

OUR TABLE OF CONTENTS

Will comprise Full Prices Current and Monthly Review of the Wholesale Markets; Diagrams of the Fluctuations of the Produce Markets; Rates of Freight and Passenger Fares—corrected monthly; Illustrations and Sketches of Prominent Men and Buildings; Editorials on Manufacturing and Industrial Progress; Departments containing appropriate reading matter and reviews for various branches of trade, including "Grocery and Provision;" "Dry Goods;" "Trades and Manufactures," etc., etc.

Our first issue for May consists of 24 pages, embracing FORTY-FIVE COLUMNS of important reading matter—mostly original and by first-class writers. Sample copies, post paid, 10 cts. Yearly subscription, in advance, $1. Subscribers to the MINING AND SCIENTIFIC PRESS or the PACIFIC RURAL PRESS will be supplied at half price.

Published by **MURRAY, DEWEY & CO.,**
At the Publishing Office of the Scientific Press and Pacific Rural Press, San Francisco.

AGENTS WANTED to canvass every town on the Pacific Coast for the MINING AND SCIENTIFIC PRESS, PACIFIC RURAL PRESS, and the PACIFIC COAST MERCANTILE DIRECTOR. Experienced canvassers preferred. Good men can make large wages, besides learning much and improving their talents.

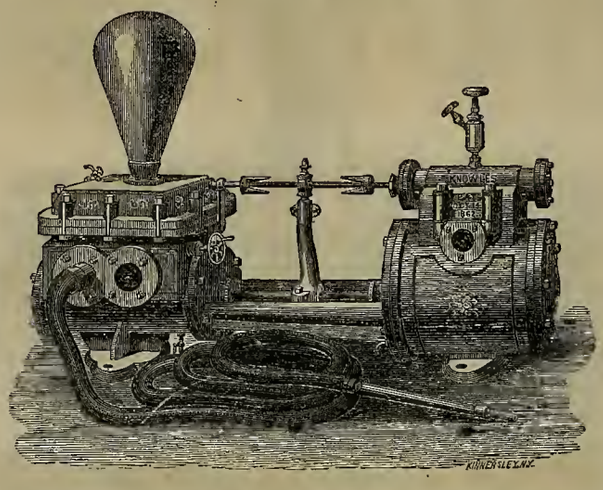
KNOWLES' PATENT STEAM PUMP.

Extract from Official Report of Mechanics' Institute Fair of San Francisco, 1871.

"In the foregoing trials it appears that the most efficient Pump on exhibition is the KNOWLES. The workmanship on this Pump is also very good. We would therefore recommend that this Pump receive a Silver Medal, (Diploma awarded). Signed by the Committee:

G. W. DICKIE, H. B. ANGELL,
CHAS. R. STEIGER, W. EPPELSHEIMER, MELVILLE ATWOOD."

v113-awbp



It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.

The trial of Steam Pumps at the Eighth Industrial Fair in San Francisco, by a Committee of Five of the most thoroughly practical mechanics on this coast, showed the Knowles Pump to lose but 11½ per cent., while others lost as high as 40 per cent., showing great difference in economy.

WE BUILD AND HAVE CONSTANTLY ON HAND

THE LARGEST STOCK OF PUMPS IN THE WORLD,

And for Every Conceivable Purpose.

A. L. FISH, Agent.

P. S.—All kinds of new and second-hand Machines on hand. 3v24-eow-bp

BLAKE'S PATENT STEAM PUMP.

From the Report of the Committee on Steam Pumps, at the Seventh Industrial Exhibition of the Mechanics' Institute, San Francisco

BLAKE'S STEAM PUMP.—This Pump yielded the best results as to the quantity of water discharged as compared with its measured capacity. The valves are of brass, and well arranged. The steam valves are well arranged for operating the pumps, either fast or slow.

We recommend that a Medal be awarded to it, as THE BEST STEAM PUMP. [Awarded a SILVER MEDAL, the first premium.] (Signed) JAS. SPIERS, WM. H. BIRCH.

From the Report of the Committee on Steam Pumps, at the Eighth (or *last*) Industrial Exhibition of the Mechanics' Institute, San Francisco:

BLAKE'S MINING PUMP.—This is an excellent Pump, well made, and gives a high per cent. of duty. We recommend a Diploma for this Pump. (Signed by the Committee.)

G. W. DICKIE, H. B. ANGEL, CHAS. R. STEIGER,
W. EPPELSHEIMER, MELVILLE ATWOOD.

[No other Steam Pump received other than a Diploma or honorable mention at the LAST Mechanics' Exhibition, *all other assertions to the contrary notwithstanding*. Hooker's Hand Pump was the *only* Pump of any kind whatsoever, that received a MEDAL and FIRST PREMIUM (highest award to pumps) at the *last* Exhibition, for which we are also selling agents.—*See official Report of the above Committee.*]

The trial of Steam Pumps at the Eighth Industrial Fair in San Francisco, by a committee of five of the most thoroughly practical mechanics on this coast (as above named), showed that the Blake Pump gave 86 per cent. of utilized power, while others gave but 60 per cent., showing great difference in economy.

The Blake Pump is the ONLY Steam Pump that EVER RECEIVED A SILVER MEDAL at any Exhibition of the Mechanics' Institute ever held in San Francisco or California.

☞ A complete stock of all sizes constantly on hand at the Machinery Warehouse of the Agents,

TREADWELL & CO.,
Market Street, corner of Fremont, SAN FRANCISCO.

THE TRUTH!

A. L. FISH, Agent Knowles' Steam Pump—Dear Sir: In answer to your inquiries, we state that the highest award for Steam Pumps at the Eighth or last Mechanics' Fair in San Francisco, was a *First Premium* and Diploma, awarded to the Knowles' Patent Steam Pump, as published in the Official List September 23d, 1871.

A. S. HALLIDIE, President Board of Managers.

VOLUME XXV. Number 2.

Portable Drilling Machines.

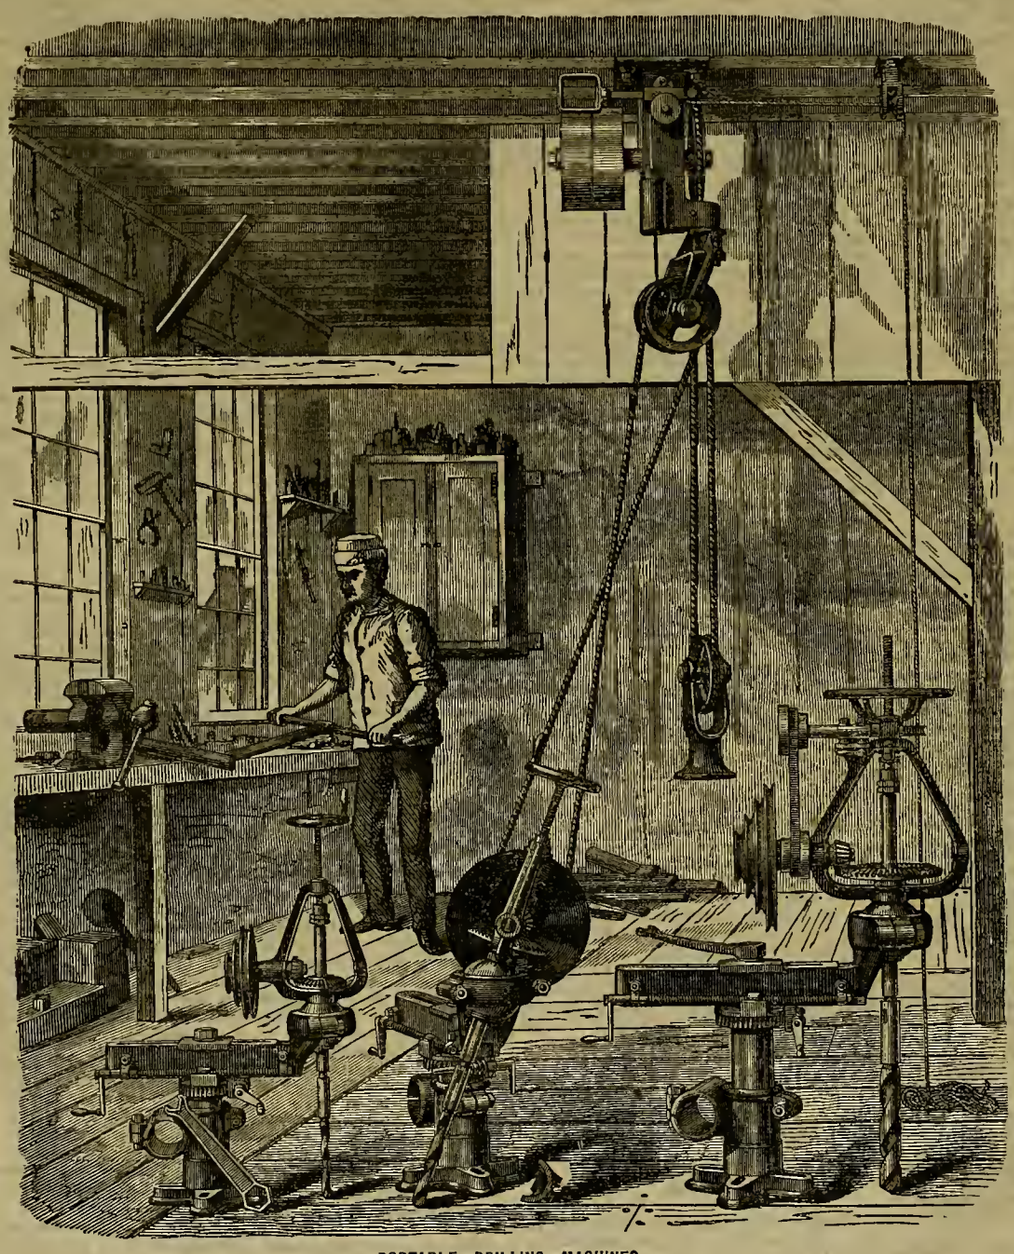
In all machine construction, much time and labor are wasted in drilling holes by hand, for the want of a practical machine driven by power, which would do the work. Our illustration represents three sizes of portable drilling machines, manufactured by Thorne and De Haven, of Philadelphia, which fulfill the conditions required of a tool for this purpose. They can be bolted to the work to be drilled, as easily as a ratchet brace can be rigged up for hand drilling, and can be driven by power in any position, at any distance, and in any direction from the driving apparatus.

Tarred rope is used for transmitting the power, and is found to be preferable in every respect to a round leather belt.

The operation as described by the *Scientific American*, is as follows: The power is transmitted, to the fast and loose pulleys on the countershaft, by means of a flat belt from the line shaft, in the usual way. On the other end of the countershaft is a grooved pulley, which gives motion to the rope which drives the drilling machine. The pulling side of this rope passes under an idler pulley held in a frame which rotates on a hollow stud, through which the rope passes. The rotation of this frame permits the rope to be led in any direction to the drill. A weighted idler is hung on the slack side of the belt, maintaining the tension and permitting the distance of the drilling machine to be varied at will. A weight of only 25 pounds hung there will prevent the rope from slipping on the pulleys when drilling a two and a half inch hole, in the solid, with an ordinary feed. When the rise and fall of this weighted idler does not give sufficient distance, additional lengths of rope can be inserted by means of the couplings used.

All the features of the machine are shown in the engraving. The hight of the post can be altered to suit different lengths of drills and chucks used in the spindle. The radial arm is traveled by a screw and rotated, on the post, by a worm and tangent wheel, giving great accuracy of adjustment and permitting this adjustment without the necessity of removing the rope from the cone pulley. The frame carrying the spindle, gears and cone pulley can be rotated so as to bring this pulley in line for the rope, in whatever position the machine may be. By removing a collar from the bottom of this frame, as shown, the spindle can be set to an angle with the base of the machine, in any direction. By holding the post in the clamp bearing on the side of the base, the machine will drill parallel to the base.

Both the driving apparatus and the drilling machine have been patented in this country and abroad. Any further information can be had by addressing Thorne & De Haven, 23d and Cherry streets, Philadelphia, Pa., or J. Austin & Co., general agents, 168 Fulton street, New York.



PORTABLE DRILLING MACHINES.

The surveying party which left San Diego two weeks ago have located fifteen miles of the San Diego and Texas road.

Arizona and the Apaches.

"More Apache outrages in Arizona" is a heading which we see in the papers of this coast about as frequently as that of "Railroads," etc. How long is this state of things to last, asks the unenlightened citizen to whom the ways and means of Commissions and Departments are unknown. Are these Indian thieves and murderers to bid defiance to a nation which considers itself the strongest in the world and which would go to war to protect the rights of a single American citizen on a foreign soil, while it permits the slaughter of hundreds within its own borders by a vacillating, weak policy.

The question may be asked, and with some reason perhaps, is anybody making any money out of the present state of affairs, for they have certainly continued as they are for a much longer time than is either pleasant or profitable to the common people. Still we may take the charitable view that it is a case of misdirected energy on the part of a few fanatics to reclaim these Indians, on the principle of somebody's theory but nobody's practice. And while these systems are being tried, the red devils pursue the even tenor of their way in their usual bloodthirsty spirit.

It is time that the pleasant little fiction of a "peace policy," which is held to by those who strive to gloss over and smooth down the realities of the case in Arizona, was done away with. Stringent means are all that will ever be successful, as any intelligent man, at all familiar with the Apaches or Arizona, knows full well. These Indians are not South Sea Islanders or natives of Borioboola-Gha, to be converted and made peaceable by the present of a hymn-book or beads; they are the ordinary home-made savage, not softened by distance, but the growth of American soil, and possessing all the vindictiveness and ferocity which characterizes their whole race. This "Peace Commissioner" system has become a nuisance; the people are tired of it and the more we know about it the more we want to improve our education by forgetting all about it.

Vincent Collyer's stupid policy was to have been perfected by General Howard, who with much better sense than his predecessor, comes back with the opinion that everybody who knew anything about the question, formed long ago, that the best way to subdue these Indians is to let them feel our power. General Howard saw it was no use to reason with the demons in human form; moral suasion was out of the question. He counselled the Government to let General Crook take them in hand a few months and we venture to say that the latter gentleman will do more in two months to "persuade" them to keep the peace than all the commissioners and red-tape enthusiasts ever heard of could do in ten years. General Howard says that no man can do anything well who is bound hand and foot by a multitude of specific orders, which may or may not apply to the situation. We are anxious to see this out-of-the-way Territory have a chance to show its worth, which under the present state of affairs it cannot do. All success to General Crook.

CORRESPONDENCE.

Meteorology of San Joaquin Valley.

EDITORS PRESS:—Observetions on temperature and rain in thie part of San Joaquin Valley, for the PRESS, are now completed for the first half of tbe current year, with the followiug

Rssults:

1872.	Average Temperature.				Highest Temp.	Lowest Temp.	Rain. Inches.
	7 A.M.	2 P.M.	9 P.M.	Mo Mean			
January....	40.20	52.30	46 15	46.21	61	27	2.38
February..	44.68	59.14	48.69	50.16	67	34	2.42
March.....	46.16	63.49	50.40	53.38	70	36	1.45
April.....	48.21	66.40	50.80	55 13	77	36	0.97
May.....	56.45	78.39	58.65	64.49	90	40	0.00
June.....	64.57	86.86	65.25	72.23	110	52	0.18

June has been marked by a few deys of excessive heet. On the 21st, at 2 P. M., the mercury in the ehade stood at 106°; on tbe 22d, 110°; the 23d, 104°. But let none of your readers for tbis reeaon dread tbe extreme heet of a Sen Joaquin Valley summer, even in June. These three were tbe only days in the moutb wben the temperature was above 100. Tbe higheet on the 24th was 86, and the greatest beat the remaining eix days ranged from 74 to 88 degrees. At 9 P. M. on tbe 27th, tbe thermometer etood at 58, or a difference of 52 degrees from the hotteet bour of the 22d. Yet we bear of no one wbo experienced any bad effects from thie remarkable renge of temperature in five deys. Sucb a

Heated Term

Usually comes but once eech snmmer, and laets only a few days. It generally occurs within two weeks after the summer solstice. A reason for this cau be seen in tbe fact tbat on June 21st, and a sbort time before and after that date, tbe eun's rays are more neerly perpendiculer to the surface of our valley than at any other period of the year. Its heat ie then naturally moet intense to us. But ae the sun lingera for eome time near the same point in the heavens, thie cauees the heet to *accumulate*, if one may be allowed to so express it. Consequently, our warmest weather is likely to occur witbin a short time after the aolstice.

In keeping with this principle, our greatest heat for eeveral years past has been as follows:

In '69, June 26th, 100 degrees; 27tb, 106; 28tb, 104; July 1st, 107. In '70, July 1st, 107; 2d, 110; 3d, 102; 4th, 106. In '71, June 29tb, 107.

In tbe present instence, it ceme just as

Old Sol Paused

In mid-heavens, wben he turned back from bis fartheet point north, and gazed upon the bonntiful crops with which bis genial influencee heve this year blessed our valley.

Well might his enthusiasm bave grown warm aa he looked for the last time before turning southward, upon our ripe and waving grain fields, and the huge stacks of wbeet and berley rapidly going up in our grain districts now ecattered from Kern river to Mt. Shasta, and at intervals filling all the space between the Sierrae end the Coaet Range. But if his enthusiasm alwaye waxes eo warm as he gazes on thie glorious sight, once a yeer is quite often enough for such hot, burning glances.

Though the beat of the 22d was as great as any we have experienced here for four years, the latter pert of June bas been quite cool. Indeed, parts of our morninge and evenings have been almost too cool to be pleasant. But theae cool nights bring us the most refresbing sleep, and etrengthen us to beer the heat of the day witbout prostration.

Onr intenee beet cannot last long at any one time, for by one of Nature's great laws of compensation, it is its own corrective. When our velley air ie eo intensely heated, it becomee very rare, and risee rapidly to a great hight. Then the cold, dense, heavy air from the mountains on eacb side of us, descende to fill thie comparative vecuum, and our air ie chilled again and purified.

It enablee the Pacific Oceen, elso, to contribute to our comfort and health. For its cooler air rushee as a brisk sea-breeze into our valley through the Golden Gate, as well es over the passes aud creste of the Coast Range. This is proved by the speciel prevalence of strong northwest winds, eoon efter all sucb heated terme. In thie way,

Our Mountains and Oceans are our Ventilators.

These are some of tbe rare advanteges of our climate—are eome of the correctivee wbich meke our inland valleys inhebitable by enabling our people to endure snch high degreee of heat, amounting in the sun even to 140° Fahrenheit, and yet enjoy the moet perfect health, and do as much hard work, perhaps, as any other people in the world.

As regards rain, the 0.18 of an inch in June makee tbe entire amount, measured at thie point, for the eeaeon, 15.92 inches. If to this amount we were allowed to add the additional rain which fell from ten to twenty milee east of us, it would probably swell the entire rainfall for thie diatrict of San Joequin valley to more then seventeen inchee.

It is probable that could we take the averege of the rainfall measured et Sacrameuto, Stockton, Grayson, and here, the peet aeeson, it would amount about to the average annual rainfall at Sacramento since 1849, that is, nineteen inchee. But not knowing the full amount that bas fallen at each of those points, we cennot give it exectly. Will not some one of your readers favor ue with the exact amount which has been measured at each of tboee points, now that we can expect no more rain until October. Our mutual observatione on the amount of rain for the season of '71–'72, are now ended, and it is only by change of our thoughts and conclusions, tbet we may bope to accomplish the most useful results.

J. W. A. W.

Turlock, July 1st, 1872.

Bullion Product for 1871.

The following is the estimate of the Commissioner of Mining Statistics of the Bullion product for 1871 as compared with the two preceding years:

	1869.	1870.	1871.
Arizona.....	$ 1,000,000	$ 800,000	$ 800,000
California....	22,500,000	25,000,000	20,000,000
Colorado.....	4,000,000	3,675,000	4,663,000
Idaho.....	7,000,000	6,000,000	5,000,000
Montana.....	9,000,000	9,100,000	8,050,000
Nevada.....	14,000,000	16,000,000	22,500,000
New Mexico..	500,000	500,000	500,000
Oregon and Washington	3,000,000	3,000,000	2,500,000
Wyoming.....		100,000	100,000
Utah.....		1,300,000	2,300,000
Other sources	500,000	525,000	250,000
Total.....	$61,5000,000	$66,000,000	$66,663,000

The only other estimate we have seen makes the prodnct $58,284,029, including British Columbia, but excluding Wyoming, New Mexico and the East. Tbat estimate is hased on the express returns, with an allowance for undervalnation and private shipments of 100 per cent. in Arizona, and 20 per cent. in California, Idaho and Montana. The amount thus obtained for Arizona is less than half the actual product; that for California is prohably correct, and has heen adonted in round numhers in the ahove estimate. Idaho and Montana, as everyhody knows who has traveled there, are not under the same conditions as California, in the ehipment of hullion, and consequently there is much more undervaluation and sending of precions metals through the U. S. mails and by private hands in these territories than in that State, where the communications are easier and the express and insnrance rates lower. The estimate to which we have referred allows $1,000,000 for shipments of ores and hase hullion from Utah, whereas the value of ores shipped from that territory during the year was ahout $1,620,900, and the value of the hase hullion $316,150 (the weights carried by rail heing 10,806 tons of the former, and 2,378 tons of the latter) to say nothing of about $500,000, the value of the lead. Again, Colorado is set down in the estimate referred to, at $3,046,917; whereas the careful statement already puhlished in onr columns shows the product of that Territory to have been $4,663,000.

Every item in the Commissioner's estimate (except that of Idaho) reets on satisfactory evidence, of which the express shipments form a part, hut not the whole. The smart statisticans of San Francisco are invited to try their hands at the method they followed so hrilliantly last year, of adding coinage to exports, by way of determining the product. The total gold and silver coinage of 1871, wes $24,070,323, and the exports of hullion, $26,233,912, the sum heing $50,304,235, or eigbt millione less than the estimate which we can positively prove to he from six to eight millions too low. It is true, that they employ in their calculations, not the coinage, hut the domestic deposits for coinage; but this heing a atill emaller amount, only makes the matter worse. The Commissioner's report, now in the hands of the Congressional printer, discusses the snhject more at length. We reprodnce his results merely, as of general interest.—*Engineering and Mining Journal.*

Mining.

The following were read hefore *The Institute of Mining Engineers*, at their late sessions in New York:

Johu A. Chnrch of New York read a paper on "Economical Results in the Treatment of Gold and Silver ores by Fusion." In thie paper the results attained in the works at Lend, in Austria, were compared with those obtained by the mill process in Colorado. The ores are the same, heing sulphides of iron, copper, lead and zinc in a rock which is mainly siliceous. The Austrian ores are much poorer than ours, containing only ¾ of an ounce of gold and 1¼ ounces of silver to the ton of 2,000 ponnds. Their value is therefore ahout $10.13 a ton. After describing tbe process nsed, which is merely the ordinary fusion of pyritiferons ores with lead, the writer said that in one fusion 73 per cent. of the silver and 90 per cent. of the gold is ohtained, while subsequent fusions hring the yield up to 96 per cent. of the silver and 99 por cent. of the gold. These are the results of 14 years' practice. Beside the precious metals, there is ahont 5 per cent. of copper in the ore, and this is ohtained in a matte. The cost is in materials, 4¼ daye' lahor, 80 hushels of charcoal (about 800 ponnds), three-quarters of a cord of wood and 10 pounds of lead. Estimating these quantities at the Colorado prices, the cost of treatment there would be $20 to $22 a ton. The richer class of Colorado ore contains on an average 3 ounces of gold and 8¼ ounces of silver to the ton, worth ahout $70. Treated hy this process there would he ahout $40 a ton for mining expenses and profit, hesides all the copper, which is a much hetter showing than the mills have yet made, The common ore of the territory is worth about $26 a ton, in gold and silver. The mills extract only abont $11 of this, or when the tailings are sold $19 a ton at the highest, at a cost which eqnals about the yield. Treated hy concentration and smelting this ore would cost ahont $20 a ton to work, and leave a profit of about $4 a ton, which would give excellent dividends, as the amount of ore raised is very large. This profit does not include the value of the copper in the matte. A great deal is said about the fancied impossihility of treating ordinary Western ores by smelting, hnt when this method is placed in good hands and receives one tenth the attention and persistent effort which milling has had, we may he sure that methods which have long heen euccessful elsewhere will not fail here.

The Great Blue Gravel Company.

This company was incorporated a short time ago with a capital of $5,000,000. The central location of the works is at Pinkham Hill, some two and a half miles from the United States ranch of Peyton Powell, some sixteen miles from here, on the Forest Hill divide. The company have bonded the following gravel mining tracts of land: These claims are known as the Rongh and Ready claims of Wiley & Co., the Big Channel Company's claims, the Wiley & Seifer claims and the Spring Garden claims of H. S. Bryan; making from 900 to 1,000 acres, and extending along the gravel channel of an old dead river some two miles, which is ahout 1,500 feet hetween the rim rocks, as determined hy actual prospecting, for a full mile and a half. Many tunnels have penetrated the channel, and found good paying gravel, but they were all too high to drain the hasin or permit the small companies to fathom the hottom or determine the depth and value of the deposit to and on the bed-rock. It is the firm helief of old miners that this channel, as defined by the rim rock which has heen cut and traced for tbe above distance, is the hed of what Hittel calls the Big Blue, one of the dead rivers of California. Indeed, at one point on this ground a shaft has been sunk 160 feet deep, through pay streake of gravel, encountering driftwood that showed plainly that it is the hed of some old river of greater magnitude than any of the living streams in these mountains of to-day. All this ground the company propose to drain hy tbe aid of hoisting works and pumps, propelled hy a powerful engiue, or at least to run an incline shaft to the hottom from the end of the tunnel at Pinkham Hill, and determine the depth and character of the deposit down to the hed-rock. The machinery and eugine is nearly completed, at the Miners' Foundry, in San Francieco, and will he on the ground and at work in a few weeks. Wm. Higby is President and Charles Dewey, Treasurer, both of San Francisco where the stock is chiefly owned, and Peyton Powell, of this county, is Superintendent. We take a deep interest in this enterprise, as ehonld all our people, and will try to keep onr readers posted on the developments as the work progresses. If it should prove a success it will be almost to a certainty the pioneer of still vaster developments of the kind on that divide.—*Auburn Herald.*

THE State Mineralogist of Wisconsin says that if the extensive ore heds in the vicinity of Black River Falls ebould he worked, enough iron could he manufactured in that region to eupply the wants of the United States for a thousand years to come.

Stamp Duties Abolished.

Tbe amendments to the Internal Revenue Act during the lest eession of Congress abolish nearly all the stamp dutiee after the 1st of October next. The tex of two ceute on checks, drefts, and ordere is still reteined, but the following instruments

No longer Require Stamps.

Coutrects for insurance against accidental injuries. Affidavite.

All agreements or contracts or renewal of the same.

Appraieements, of value or damages, or for any other purpoee.

Aseignments, of a lease, mortgage, policy of inenrance, or anything else.

Bills of exchenge, foreign, inland, letters of credit, or anything of tbat kind now taxed by stamps.

Bills of leding end receipts, in the United Statee or for anywhere else.

Bills of eale, of any kind.

Bonds of indemnification, of any kind.

Bond of administrator or guardian, or auything that bas the name of bond on it and now taxed by etemp.

Brokers' notee.

Certificetes of measurement of anything.

Certificates, of etock, profits, damege, deposit, or any other kind of certificate now taxed by stamp.

Charter or its renewal or a charter party of any kind.

All contrects or agreements.

Conveyances and any part of tbe work of conveying deede.

Endorsement of any negotiable or not negotiable instrument.

Entry, for consumption, warehousing, or withdrawal.

Gaugers' returns.

Insurence policies, contracts, tickets, renewale, etc., (life, merine, inlend and fire.)

Leaee. All througb the lease list is aboliebed.

Legal documents. Writ or other process, confeasion of judgment, cognovit, appeals, warrante, etc., letters of administration, testamentary, etc.

Manifest at Custom House, or anywbere else, or for auy purpose.

Mortgage, of eny kind.

Passage ticket, to any place in the world.

Pawnere' checks.

Power of attorney for any purpose.

Probate of will, of any kind.

Promieeory note for anything.

Protest of any kind.

Quit claim deed.

Receipt. Now generally exempt, and if inclnded in present law in any case, will be hereafter exempt.

Sheriffs' returns.

Trust deed.

Warehouse receipt.

Warrant of attorney.

Weigbers' return, of auy character.

Silver Zone District.

The new and very rich discoveries of silver made in the Silver Zone district situated twenty due miles south of Toano, a station on the line of the Central Pacific Railroad is creating great excitement wherever known. This district is in the eastern portion of Elko county, in this State. Major Roht. M. Goldman, one of the original discoverers of this vast deposit of silver ore is very enthusiastic in his opinions of the merits of that district. His ohject in coming to this portion of the State is to induce capitalists to visit the district and eee and examine the mines for themselves. He hrought with him several specimens of rock from different ledges on the lode, and left a few here to he assayed at the Auhurn mill. He firmly believes that the assays will he from $200 to $5,000 per ton, and these specimens are mostly croppings from the top of the ledges. The major portion he took with him to Virginia to show to practical miners and capitalists there. The Silver Zone, Wilson, Currier and Goldman, Poor Man's, Star of the West, Gov. Bradley and Delmonico are the names of the most prominent ledges that have thus far heen located. Five springs in the immediate vicinity furnish drinking water in abundance. If the report of the wonderful richness of this district as given by the Mejor is correct, and we helieve it is, there will be a tremendous excitement in that seotion ere long.—*Reno State Journal.*

ENGLISH RAILS.—The United States are gradnelly monopolizing the supply of Englisb rails. During the firet four months of this year, the importetion of rails from Great Britain to thie country was 180,193 tons, being an increase over the eame period in 1871, 44,772 tons, while the exporte to the Englisb posseesions and the wbole world besides only amounted to 99,068 tons; showing that the United States are taking abont two-thirds of all the rails exported from Great Britain.

A narrow gauge railroad, 147 miles in length, is being constrncted from St. Louis to Cario.

Scientific Progress.

Recording Musical Notes.

Each of the many vibrations that have concurred in the production of a musical note can be recorded so as to be visible to a moderately large audience, by the use of no other apparatus than a piece of chalk and an ordinary blackboard.

The peculiarly shrill, disagreeable sound often heard when a slate pencil or piece of chalk is drawn rapidly over a slate, is well known. It occurs when the contact between the pencil and the slate is not continuous. Each time the pencil touches the slate a slight tap is produced, and these taps, following each other rapidly, link themselves into a sound more or less musical. They may be legibly recorded as follows:—

An ordinary chalk crayon is held loosely in the hand near one end, and inclined so that the acute angle made by the other end with the surface of a blackboard is about 30°. If now the crayon be pushed in the direction of the obtuse angle, it will be set into rapid vibrations, and, striking against the board at nearly equal intervals, will produce a musical note. At each contact a legible mark is make on the board. By giving the chalk a uniform velocity, the pitch of the sound is kept quite constant, and the exact number of vibrations corresponding to any particular note, can be readily ascertained by counting the marks impressed on the board in a given time.

A very little practice will enable one to produce these effects quite readily. By altering the inclination and pressure, the pitch of the note can be varied at will, and the class or audience enabled to see the cause of the variations in notes of different pitch. In many cases, by a close inspection of the marks, it will be seen that each of them has been formed by two or more separate marks, one of which is generally more prominent than the others. This corresponds to the fundamental tone of the sound, the others to the overtones, and thus we have a visible proof of the cause of the difference in quality observable in certain notes of the same pitch. By considerable practice, the variations in the pitch of the notes can be obtained so readily that a tune may even be evoked from the board, which after the performance will contain a physical analysis of the individual notes.

Star Depths.—The mind of man utterly fails to realize the immensity of space, and no one unaccustomed to the use of the telescope can have any adequate idea of the difference presented by the heavens when viewed by the naked eye, even upon a clear night, and the scene which is disclosed to the eye and mind of the astronomer. How difficult it is to realize that each star in the solemn depths of the universe is a sun like our sun, but separated one from each other and our own by distances almost beyond the power of man to compute!

Only about 3,000 stars can be distinctly seen and counted by the naked eye, while an ordinary telescope reveals the presence of something like 350,000. Herschel'e great 18-in. instrument, it ie estimated, shows 180,000,000, while the great Rosse telescope, by its vast penetrating power, is supposed to open up to our vieion not less than 700,000,000! And yet when the whole heavens is swept by this telescope, we have only penetrated a distance into space from our standpoint on this globe, which, when compared to the immensity beyond, is no more than the space occupied by the room where we write or read is to the immensity of depth penetrated by the last mentioned instrument!

Future Eclipses of the Sun.—Mr. Robert T. Paine communicates to *Silliman's Journal* a list of eclipses visible in the United States during the remainder of this century. The first central eclipse will be that of September 29, 1875, which will be annular in part of the State of New York and in four of the New England States. The duration of the ring on the central line will be three minutes thirty-nine seconds. At Boston it will be only two minutes twenty-nine seconds. The belt of country over which the annular eclipse will extend will be 110 miles wide. Within it are situated the observatories of Hamilton College, Albany, Harvard University, Amherst College, and Dartmouth College. The first total eclipse will be that of July 29, 1878, when the shadow of the moon will pass over British Columbia, Montana, Colorado, Texas and Cuba. At Denver, Colorado, the eclipse will be total nearly three minutes.

Determination of Hight of Auroras.—Dr. J. G. Galle, director of the observatory at Breslau, celebrated as being the first to recognize the planet Neptune in the telescope, has lately given a new method of determinging the hight of the aurora. It is founded upon the hypothesis that the rays which form the auroral crown are parallel to the magnet pole. The deviation from apparent parallelism he considers dne to parallax, and thus calculates the distance of the rays. From a number of observations made by himself and Dr. Reimann he finds that the direction of the rays in the aurora of February 4, deviated from the magnetic zenith by from 3° 6′ to 10° 2′. He thus finds for the different rays hights varying from 150 to 280 miles.

Reversal of Spectrum Lines of Metallic Vapors.

While photographing the most actinic ray in the magnesium spectrum—a triple band situated between H and L in the ultra-violet—Cornu observed that, on increasing the intensity of the induction spark, not only was a longer exposure required, but the band became a quintuple one, the two least refrangible rays being doubled. The author having obtained this effect in the visible spectrum also, attributed it to a reversal of these doubled lines, produced by an atmosphere of incandescent metallic vapor surrounding the path of the spark. Indeed, by covering one-half the slit of the spectroscope with the metallic spark from a weak coil, and the other with the spark from a powerful coil, it is possible to see the rays superposed, the bright and the reversed line being continuous. For the positive pole Cornu uses a carbon disk in which are cavities for the reception of the metal. The negative carbon is lowered until the spark passes, and then raised until the arc is 4 or 5 millimeters long. An image of this spark is formed on the slit by means of a lens, the spectrum, in the case of magnesium, showing the triple green ray *b* with great sharpness. On lowering now the upper carbon, the bands widen, become ill-defined, and soon a fine black line appears on the least refrangible of them. If the lowering of the carbon be continued, the second and at last the third are reversed also. In this way the author has succeeded in reversing rays in the spectra of sodium, thallium, lead, silver, aluminum, magnesium, cadmium, zinc and copper; the facility of reversal being in the order given. The result was also obtained with sodium and lithium chlorides. Applying this discovery to the sun, the author concludes: (1) that an exceedingly thin stratum of vapor suffices for the reversal; one, the thickness which could not possibly be seen from the earth; and (2) that it is by no means necessary to suppose a continuous atmosphere, even of this thinness, around the sun; the absorption may be purely local, produced spontaneously by exterior cooling around each incandescent point—*Comptes Rendus.*

Germination—Its Relation to Light.—The theory of the germination of plants, which has been heretofore admitted requires that the germinating seed be excluded from direct sunlight. Late experiments appear to establish the fact that, while exclusion from the luminous rays of the solar spectrum is necessary to the healthy germination of seeds, yet the chemical or actinic rays are indispensable to the process. These penetrate much deeper into the soil than do the luminous rays. The exclusion of the chemical rays, and not the absence of oxygen alone, is assumed to be the cause of seeds failing to grow when buried too deeply in the earth. Will our agricultural colleges settle this question by careful experiments? Let us have all that can be known of the mysteries of plant life.

Appropriation for Astronomical Purposes. The General Appropriation Act passed at the last session of Congress sets aside $75,000 for the establishment of an astronomical base, and the continuance of military and geographical surveys and explorations west of the 100th meridian of longitude. These surveys and explorations are under the charge of Lieutenant George M. Wheeler, who headed the expedition that explored a line last year from Elko to the Mexican Boundary. He was to start from Washington about a week ago to continue his work. Much is expected from his explorations, and many inquiries have been made for printed copies of his last report, but the Government printing office has not yet turned them out.

Anomalous Production of Ozone.—Prof. H. H. Crofts, of Toronto, has repeatedly found ozone produced during the crystallization of iodic acid. The evolution of ozone does not commence until crystals are formed, and even when the first few form, no ozone has been noticed. But when the crystallization has set in fully, the evolution of ozone is remarkable, obvious to the sense of smell and reacting strongly on iodized starch paper. The Professor is unable to give an explanation of the phenomenon.

Change of Habit.—*Loranthus macranthus* of New Zealand, parasitic there upon trees of *Rutaceæ* and *Violaceæ*, is deserting these in favor of trees introduced by the European settlers, such as hawthorn, plum, peach, and especially laburnum, which was introduced as lately as 1859. Its flowers are abundantly visited by the European honey-bee.—*Garden.*

Petroleum in San Domingo.—Prof. Gabb finds a locality, the only one in the Dominican Republic, of bituminous products on the island of Santo Domingo. The spot "reminds him strikingly of the California petroleum springs, not less in the existance of oil, pitch and gas, than in the usual broken-down steam engine and fragments of artesian well tools lying scattered about."

Copper in Cocoa.—Careful chemical analyses show that cocoa and chocolate always contain a small percentage of copper. The husks of the cocoa have been found to contain as high as 0.025 per cent. of copper, while the kernel of the bean only contained 0.004. Samples of chocolate contained 0.0125 of copper.

Mechanical Progress.

Improved Iron Processes.

Scarcely a month passes without the announcement of some alleged or real improvement in the methods of smelting iron, converting iron into steel, or working up iron into the various forms called for in the consumption of that important article.

A new and cheap alloy of iron, called Sterling Metal, lately produced, is reported to be harder than cast-steel, and, if so, will come into use for edge tools. The process of converting pig iron into wrought iron, in a puddling furnace worked by machinery, is coming into favor, saving much hand labor. The conversion of cast iron into steel by puddling, at one operation, is also becoming important. The slag of iron foundries, heretofore valueless, is now pulverized and mixed with lime, to make bricks, artificial stone, and ornamental articles of many kinds. In an Iron smelting furnace lately tried at Hudson, New York, the smoke passes out not at the top, as in the ordinary furnaces, but through flues nine feet below the top, and it is said that there is a saving of twenty-five per cent. in the quantity of coal required to make a ton of pig iron. Nearly every periodical devoted to the industrial arts tells of late progress of inventions in the working of iron.

Krigar's Cupola Furnace.—Henry Krigar, of Berlin, constructs his cupola so that the lower part of the earth is not below the crucible, but by its side, and connected with it by a slanting canal, which is about three inches high, six to eight inches long, and as wide as the cupola. This arrangement prevents any coke or half melted iron from falling down in the hearth, which is only accessible to melted iron and slag, and forms for them a kind of sump or receiver, which in no way interferes with the regular working of the two upper parts of the cupola. This very simple construction has proved highly successful, and its great advantages are a saving of fuel, a uniformly hot and liquid iron, and an increased yield per diem, as the regular smelting operation is never interrupted. Krigar's cupola can, therefore, be recommended not only to foundries, but also to Bessemer works and to such forges as use the Dank's puddling furnace with liquid iron, as a uniform heat and quality of each charge are essential for their success.—*Engineering.*

Advantage of Labor-Saving Machinery.—In no way has the beneficial effect of labor-saving machines in improving the condition of workmen been better exemplified than by the application of the sewing machine to the manufacture of shoes. The workmen of Lynn, Massachusetts, who in 1862 were earning 10 dollars a week without the assistance of the leather sewing machine, are now, it is reported, earning 50 dollars a week with the aid of this useful apparatus. The inventor, who in 1862 was threatened with mob violence, is now considered by the workmen as their greatest benefactor. Within the last ten years the town of Lynn has doubled in population and taxable property, and it is estimated that 44,000,000 dollars have been saved to the whole country by the invention of the sewing-machine as apparatus as applied to the manufacture of articles of leather.

The Different Methods of Making Steel.—Mr. Thomas M. Drown gives the following classification of the different methods of making steel: I. Crude steel: 1. From the ore direct, by reduction and carbouization. Ore steel 2. From pig-iron by decarburization. Pig-iron steel. *(a)* By means of gaseous oxidizing agents (air, steam, etc.) Example: Bessemer process. *(b)* By means of solid, oxidizing agents (ore, saltpetre, etc.) Ex: puddling process, Heaton process, etc. 3. From wrought iron by carburization. Wrought iron, steel. *(a)* By fusion with pig-iron. Ex: Martin-process. *(b)* By fusion with coal or carbonaceous matter. Ex: Mushet's process, Indian process. *(c)* By heating in charcoal, without fusion. Ex: Cementation process. *(d)* By heating in atmosphere of carburetted hydrogen, without fusion. Ex: Macintosh process. II. Fine Steel: 1. By fagottiug crude steel. Shear steel. 2. By remelting crude steel. Cast steel.

An Alloy to Unite Iron and Brass.—C. Mene communicates the fact that an alloy, composed of 3 parts of tin, 39.5 copper and 7.5 parts of zinc, is very well adapted for joining brass or copper to iron and steel. The author suggests likewise the propriety of increasing the proportion of zinc in the mixture to 10 parts, since the heat of the smelting operation volatilizes enough of it to bring it down to the amount named.

Stretching of Chains.—Professor Trowbridge, of Yale College, has stated that at the Novelty works, N. Y., he once made a chain a thousand feet long, to be used for pulling a load of ten tons up an incline five hundred feet long and one hundred feet high. In one year he took out, little by little, sixteen feet of slack caused by stretching. The chain got stretched out in time, though, and then did not alter.

Mechanical Progress.—The surprising advances made by the arts at the present time—advances which are made at a rate far exceeding that of former times—is readily accounted for by the reflex action which each invention has upon others. Taking the steam engine as an example, it will readily be seen that if the most perfect drawing of one of our modern steam engines had been presented to the mechanic of the seventeenth century it would not have enabled them to construct one like it. The planing machine, the slide-lathe, the power punch, the shears, and numerous other machines had to be invented before the modern steam engine could become a possibility. To them the boring out of a true cylinder, six feet in diameter and eight feet long, would have been an utter impossibility. Our modern steamships, locomotives and factories depend for their success not only upon the invention of steam engines and special machines, but upon the ability of our machine shops to construct these engines and machines after they have been invented.

Mammoth Car.—Among the mechanical novelties to be seen at the Grand Central Depot, in New York, is a steam railway car 70 ft. wide, which travels on a track of corresponding width. This great vehicle is made in the form of a low platform car, and the track on which it runs is provided with four rails, extending from Fourth Avenue to Madison Avenue. The car is used for the lateral transfer of passenger cars from the main tracks of the Hudson River, Harlem and New Haven Railways to the various side tracks, thus avoiding the use of turntables. The car is propelled by steam, the engine and boiler being contained within a sheet-iron house carried on one side of the machine. The cars to be transferred are run upon the great car; steam is then turned on and the huge machine trots off with its burden with as much ease as a horse draws a buggy. The machine is supported on eight wheels, arranged on independent axles. There are in addition four driving wheels arranged upon one axle.

Car Starter—William M. Stratton and William E. Stratton, of West Troy, N. Y., have recently patented an improvement in apparatus for storing up, in a spring or springs, the power expended in arresting the motion of the car, to be used in setting it in motion again, and it consists in having the drum, which is employed to wind up the tension cord of the spring, made with such devices and arranged in such a manner that it may be locked and held after being detached from the gearing connected with the axle to wind it up, so that the car may be allow to run awhile before the power of the spring is applied; thus making the apparatus capable of retaining the power stored up in the spring while the car is going down a descending grade and using it on an ascending grade, the car running free between the grades. The invention also consists in certain novel devices, for thus detaching, holding, and locking the winding drum.

The Baltimore Tunnel.—Among the important tunneling operations now in progress, is the railroad tunnel now being constructed under the city of Baltimore. The necessity of such a work must be apparent to every one who has had occasion to pass from one railroad terminus to the other on the opposite side of that city, by the slow horse-car conveyance now in use there. This tunnel will be 1¼ miles in length and is being pushed forward as rapidly as the nature of the work will admit. The work of excavation is being carried on at the rate of about 100 feet per day, at eleven different points.

The tunnel for the most part, passes under the streets. The excavation goes on from the surface; permanent side walls are constructed, the excavation arched over, and the road way or other earth area replaced. Over 1,800 feet had been completed and arched over, up to the middle of June.

A Pressure Gauge for Guns.—The principal suggested by Tresca's experiments on the flow of solids has been applied in practice for determining the pressure produced in the bore of large guns. A cylindrical hole, bored into the gun, is filled by a block of lead, supported behind by a steel block, through which is a small cylindrical hole. When pressure acts upon the lead, a portion of it is forced into the hole in the steel block. By estimating the volume of lead found in the cavity after a discharge, a means of measuring the pressure exerted within the gun is given.

The Danks' Furnace.—The Cincinnati Railway Iron Works, where nine of the Danks' puddlers are in use, have abandoned the melting of pig metal in the furnace itself, and now melt in a blast furnace, from whence the metal is conveyed to the puddling machines. By this means it is claimed that a saving of 50 per cent. can be made in time, enabling them to dispose of two heats per hour in each furnace, running 500-lb. blooms. By thorough acquaintance with the furnace it is found that light iron can be made almost as readily as rails.

Boston is likely to be the first city in the East to invest in a narrow-gauge railway. It proposes a line to run from the city to Revere and Lynn beaches.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

California.

ALPINE COUNTY.

Alpine *Chronicle*, June 29: GLOBE.—The shaft having been sunk 50 ft., as far as present pumping power will permit. Drifting was resumed this week, and some good copper ore taken out.

EXCHEQUER MILL.—Plans are being prepared for the enlargemsnt and remodeling of this mill. A turbine is to he added.

SCHENECTADY.—The connection hetwcen the upper and lower tunnel was made this wsek; thns facilitating getting ont the ore.

HOISTING WORKS.—The hoisting works for the Exchequer and I X L mines will arrive in about 3 weeks per rail from New York.

AMADOR COUNTY.

AMADOR.—Amador *Dispatch*, July 6: The new hoisting works are progressing finely, and the fire in the shaft is thought to be extinguished.

KENNEDY.—The Kennedy after a run of 28 days cleaned up $10,000. The rock is becomiug richer aud more abundant as the mine is developed.

TOO BIG.—Last week we stated that the hydraulic claims of Rice & Co., Upper Rancheria had yielded $9,000 for the winter's work. This we have since learned is not the fact; that while the claim yielded fair returns, it did not rsach near the figures stated.

CALAVERAS COUNTY.

OHIO CONS. CO.—Calaveras *Chronicle*, July 6: This Co. at West Point are driving one of the finest tunnels in the Co., through hard granite, to cross cut the leads in the hill.

The property is composed of 3 parallel veins varying from 10 inohes to 3 ft. in width. The walls of the ledges are distinctly defined in all of them.

UPPER COUNTY ITEMS.—The Woodhouse, helow Sandy Gulch, has nearly 400 tons of ore on its dumps, worth $15 psr ton. The vsin is from 4 to 6 ft. wide and can he traced for milss. A 10-stamp mill will be erected this season. Running tnnnel ... Steam hoisting worke are going up on the Sanderson....Petticoat stoping high grade ore, and extsnding levels....Gamhle & Co. had a heavy clean-up recently at the rate of over $20 per ton....J. Herzer is now crushing a large quantity of very handsome stone....Wolverine has commenced stoping. The owners intend to replace the portahle engine on the main shaft hy a powerful stationary engine, and start sinking forthwith....Chas. Hœrchner & Co. have out considerahle of that rich ore....The Josephine, hetween the Forks, has becn bonded for $6,000.... Frank Williams crushed 20 tons of ore, yielding $40 per ton....A. M. Harris worked 50 lbe. of sulphurets from the vioinity of the Rattlesnake, producing 72 cents per pound....J. H. Reed & Co. are sinking a fine shaft on the former French Lead; down about 25 ft....Bartolo crushed a tsst lot which oontained at lsast 20 per cent. of pure granite; $60 per ton, 15 tons. The vein in the Bartolo shaft is widening; hanging wall, soft....Blazing Star is improving wouderfully by sinking. Shaft 100 ft. Walls about 6 ft. apart and pay ore nearly 4 ft. wide. The ore is worth $125 per ton....A. S. F. Co. bave started a large tunnel at the old Forrest mill, 6 miles ahove West Point, to prospect a lava ridge.

RICH QUARTZ.—On Tuesday we were shown some very rich specimens of quartz from a ledge recently discovered in the Whisky Slide dist. The rock shown us was among the richest we ever saw. Hopper and Harper, are the owners of the mine, which is located on Jeeus Maria creek near Horse Thief Bar. A shaft 45 ft. deep has heen sunk on the ledge, which varies from 1 to 5 ft. in thickness. A tunnel is also being run into the hill, following the lead, which will he 200 ft. helow the surface when driven ahead a short distance.

GOOD YIELD.—Twelve tons of quartz from Haupt & McBath's mine, Musquito Gulch, netted $60 per ton. The rock was from a prospecting shaft which has been eunk only ahout 30 ft.

PETTICOAT.—The main ehaft is to be sunk 200 ft. deeper, making 550 ft. in all.

THE new mill on the Prussian hill mine blew its whistle for the first time last Monday. Crushiug has commenced and the maohinery works to a charm.

LLOYD'S FIVE-STAMPER.—Calaveras *Citizen*, July 6: This mill has been stopped awhile to enahle workmen to replace the old stsmps hy heavier ones.

THE Capitol is down nearly 60 ft.

CONTRA COSTA.

BLACK DIAMOND SHAFT.—Contra Costa *Gazette*, July 6: The shaft recently commenced by the Black Diamond Co. at Nortonville, is some 200 yards north of the range of the openings of the Mt. Hope and Black Diamond inclines. The shaft is 11 by 22 ft. and is expected to strike the coal vein at perpendicular depth of 450 to 500 ft. from the surfaoe.

EL DORADO COUNTY.

GOOD YIELD. — Placerville *Democrat*, July 6: The St. Lawrence mine for June—22 days' work—cleaned up 31 lbs. of gold.

INYO COUNTY.

BULLION.—Inyo *Independent*, June 29: On the 20th inst. Hiskey & Walker shipped from the Deep Spring mill $3,700—from Lida ore.

GOT TO WORK.—Supt. Wingard has finally got to work on the Silver Sprout.

MARIPOSA COUNTY.

POOL MINE Mariposa *Gazette*, July 5: Forty tons of rock from this mine, near Hornitos, were crushed at the Gaines mill a few days ago, and yielded $40 per ton.

NEVADA COUNTY.

TOWN TALK.—Grass Valley *Union*, July 3: This mine was cleaned np last Saturday after a 4-weeke rnn. The result was $3,000. The expenses, all told, were $1,200, leaving a profit of $1,800.

NUGGET.—Last Sunday Wm. Wallace found a nngget of gold and quartz worth nearly $1,000. It was from the Baltic Co.'s ground on Squirrel creek.

SAN DIEGO COUNTY.

BULLION.—San Diego *Union*, July 4: Bullion amounting to $3,030 was shipped to S. F. yesterday.

ITEMS.—The Kiug boys are busy packing ore to the Redman mill from the Golden Chariot. They will have crushed about 100 tons, from which they will ohtain at least $25,000. With this amount they will put up a 10-stamp mill, and in future do their own crushing.

The mill of DeFrees & Moor is running steadily, and will soon make a rich clesnup.

The Van Wert is condncted by Taylor & Co., who have a lease of the mine. Some very rich rock was strnck a few days ago in the new shaft.

At Banner Dist. the mines being worked are the Golden Chariot, Ready Relief, Big Blue, Antelope, Madden and Kentuok. King & Co., of the Golden Chariot, have a lsrge quantity of very rich ore on their dump.

Bailey & Co., of the Ready Relief, cleaned up a few days ago. The rock yielded $300 per ton.

Yesterday I paid a visit to the Stonewall. This is the mammoth lead of Southern California. In the level where the men are working, taking out rock, the lead measures 26 ft. in width, all of which pays alike, the gold being evenly distrihuted through the rock. The foundation is being graded and the timhers placed in position for the new mill, which is to be 50 hy 100 ft. The engine is 40-horse power. They design putting up a new battery with 10 stamps.

SIERRA COUNTY.

HIGH COMMISSION.—Downieville *Messenger*, June 29: The Falk Bros. have agreed to huild a mill to crush the High Commission rock for one-quarter of the mine.

TUOLUMNE COUNTY.

GOLDEN GATE.—Sonora *Independent*, Jnly 6: On Wednesday we were shown rock from this vein, ohtained at a depth of 45 ft. which prospsots over $250 per ton in free gold. Three shafts have bseu put down in a distance of 200 ft.—one 10, one 14 and one 45 ft.—all prospecting rich. In the last the rock grows hetter, and the vein is 4½ ft. wide, the vein ahove varying from 3½ to 5½ ft. in width.

Nevada.

EUREKA DISTRICT.

BULLION.—Eureka *Sentinel*, July 3: W. F. & Co. yesterday shipped one bar valued at $1,538, produced at the Lemon mill.

EUREKA S. M. & S. Co.—The above Co. has heen organized to operate in thie dist. The old Buttercup property has been redeemed and goes into the new concern. Operations are to he commenced at once on a comprehensive scale.

RESUMED.—During the past week work has been resumed on the Ida, Mayflower, H. Cady and old Put.

PHENIX.—A finer hody of ore than ever found hefore in this mine has heen developed on the 300-ft. level in the last few days. The deposit is immense, and the ore of extraordinary high grade. The fnrnace started up last Monday.

HOME TICKET.—This mine is heing vigorously worked. The Walter shaft adjoining the original Home Ticket location on the east, is down 95 ft., disclosing a fine 6-ft. ledge of splendid ore.

SILVER WEST FURNACE.—Work on Capt. Taylor's Silver West furnsce is progressing satisfactorily. It will he ready for active operations inside of 4 weeks.

RICHMOND.—The hoisting works are completed and ready for use.

LANDER CONS.—Work will be started up in about 10 days.

ADAMS HILL.—The new steam hoisting works went into operation yesterday, and worked like a charm.

MINERAL HILL.—The Austin Co. has resumed the working of ite mine, and has in consideration the immediate hnilding of a mill or the purchaee of one from the Mineral Hill Co.

OUR MINES.—The Slow and Sure Mine, on Prospect Mt., in the new inoline, is developing a fine vein of quartz.

The Welsh King was being prospected for a few days during the past week, and quantities of galena and gray carhonate were discovered in the openings made.

The Dolphin is another mine hsing opened on Prospect Mt., which showed almost immediately a fine vein of ore.

HUMBOLDT.

BULLION.—Unionville *Silver State*, July 6th: Amount shipped from Arizona since our last issue, was $11,682.

CLIFFLAND.—Work is about to be again prosecuted on this ledge.

BRADLEY.—The shaft on the mine is 55 ft. deep, and the ledge at that depth looks well,

ELY DISTRICT.

BULLION.—Ely *Record*, Jnne 30th: W., F. & Co., shipped since June 23d, hullion valucd at $106,601.76.

PIOCHE.—The Bowery mill started up on ore from this mine on Friday, and will he kept steadily running for some time. On the 24th inst. the Sup. shipped $11,172.26, and on Friday last 28th, $6,804 49 was shipped, a total in 4 days of $17,976.75. The stopes throughout the mine are looking well and yielding the nsual amount of ore. On dump at present about 150 tons of fine ore, and 100 tons also on hand at the Bowery mill.

LOUISE.—Anna Dickinson shaft down 75 ft. and still sinking. Raising some very fine ore and ledge improving. The Goodspeed shaft is down 76 ft., a contract having heen completed on the same. The vein showe 3 ft. in width, and in hottom carries 18 inches of good milling ore. The shaft is down about 40 ft., with the ledge showing well in the hottom. The shaft will be sunk from this point on an incline following the ledge, which stands at an angle of about 50°.

SUNBEAM. — On the 22d inst., a large hody of fine ore was found in the ledge, averaging 2 ft. in width of solid ore, which shows an average in assays of $180 in silver and $30 in gold—total $210.

CHIEF OF THE HILLS. — Ventilation throughout the mines is perfect. Pushing drifts ahead as usual. On the lower level, in east drift, a large hody of fine ore has heen opened up and shows over 2 ft. in width. A ten-stamp mill has heen ordersd, and is expected to arrive in about 90 days.

HARPER.—Contract on sinking shaft 50 ft. has heen completed, and are running a drift southwest from bottom to strike the ledge, passed throngh in sinking.

NEWARK.—Shut down the workings below on the 29th and have discharged all the men employed except a sufficient number to do the work required in the timbering of the shaft.

RAYMOND & ELY.—Work on Burke and Creole shafts continues as usnal, some good ore being taken from the latter. The Lightner shaft yields well, stopes and drifts ehow heavy bodiee of ore in all parts. Still shipping more ore to mill daily than can be crushed hy the 50 stampe.

ALPS.—Shaft down 140 ft., and sinking coutinuee as usnal, slow progress heing made.

SETTING SUN.—West drift is 50 ft. from shaft, and looking well in the face.

MOCKING BIRD.—The ehaft is down over 30 ft. The ledge is etrong, regular and well defined. Considerahle lead is found in the vein, which is a very good prospect in this district.

BOWERY.—Work continnes as nsual in the old works. The mill is in complete running order, and started np on Friday on ore from the Pioche. The furnace is nearly completed.

STIRLING.—A new contract has been let to eink the ehaft 50 ft. from the present 150-ft. level. Ae soon as this is completed a drift will run acroee the ledge.

EXCELSIOR.—Stopes continue to yield well and ore improves in quantity and quality as opened upon. Opening of the mine, by means of winzes and drifts is being pushed ahead rapidly. At present abont 400 tons of fine milling ore on dump.

HIGHLAND DIST.—Most of the claims in that ssction have suspended work, although preparations are heing made to start up again on the principal ones in the early part of the coming month.

CONDOR.—No. 1 shaft is much harder than it has been for some time past. The chloride streak in the bottom, mentioned bsfore, continues to widsn daily, and assays from the bottom show an increased per cent. of silver; down 148 ft. No. 2 shaft continues hard aud slow progress is made in sinking. Down 33 ft. and constantly improving.

MEADOW VALLEY.—Mine looking well in all parts, and stopes yielding well. Work on Summit shaft progresses favorably and the huilding is almost completed. Shipping usual quantity of ore to mill, with a great improvement noticeable in the quality of that taken from No. 3 shaft.

AMERIOAN FLAG.—Mine is looking well in all portions, and stopes yielding abuudantly. Lower level shows good ore in the drift and good, wide ledge throughout. Hoisting machinery on the way is expected daily.

AZTEC.—Shaft 75 ft. in depth, and shows a well defined ledge from 18 to 24 inches in width on the bottom. Assays during the past week from ore show $372.01 per ton. A third shift will be put to work on the first prox., and developments of an important character will douhtless soon be made.

GREY EAGLE.—Temporarily suspended work, pending orders from S. F.

CHAPMAN.—Continue raising ore steadily, and are increasing the amount daily. Stoping going ahead, and a constant improvement in the quantity and quality in the ore extracted is noticeable since our last.

SAN JOSE.—Work progressing favorably on this clsim and quality of ore constantly improving. Incline is 115 ft. deep, with working prospects hetter than ever.

AMAZON.—For the past wsek the quality of the ore has heen constantly improving aod shows average assays of $98.90 per ton, with a ledge from 2½ to 3 ft. in width.

WAEHINGTON & CREOLE.—Work on the drifts continue with good progress being made. Face of both drifts looking well, with promising indications.

VICTOR.—Situated west of the Settiug Sun. Sinking of the shaft progresses favorably and ledge shows 4 ft. wido in the bottom.

WASHOE.

LOOAL SUMMARY. — Gold Hill *News*, July 6th: IMPERIAL-EMPIRE. — The east drift at the 1,500 ft. level is in 72 ft., and the face shows only clay, quartz and some porphyry. The 1,650 ft. level drift has only penetrated the vein ahout 25 ft., and finds more quartz and hetter general indications than in the level above. At the 1,500 ft. level no signs of the east wall are visihle, and there should not he for some distance yet. The incline is dowu 110 ft. helow the lowest level, and another station will soon be opened.

BELCHER.—Daily yield 230 tons. The ore hreaste at the 1,000 ft. lewel are looking and yielding better than ever. Some immensely rich gold ore is found in streaks and hunches in this level. The force of the south drift at this level is still in very fine ore. The hreasts and stopes at the 1,100 ft. level, look and yisld as well as ever. The west drift from the main south drift at this level has reached the point of intsrsection with the main inclins, but it will take 4 or 5 weeks yet before the incline can be completed.

OPHIR.—Work in all the departments is progressing finely. The shaft is down 90 ft. below the 1,300 ft. level and sinking 3 ft. per day. The north drift of the 1,100 ft. level is pnshed with vigor.

SENATOR.—This claim lying east of the Hale & Norcross, has a shaft 260 ft. deep, with a drift west from it 150 ft. developing a good streak of good quality of ore from 10 to 15 ft. wide, which assays well.

CROWN POINT.—Daily yield about 500 tone. The water in the lower part of the mine is draining out slowly, but constantly, the pumpe working well. Considerable improvement is noticeahle in the 1,200 ft. level.

VIRGINIA.—The main south drift at the 500 ft. level ie driving ahead with fair prospects. In the north portion of this level preparations are heing made to get at a hody of good ore known to exist there.

YELLOW JACKET—Daily yield 25 tons of ore from the old workings. The 1,540 ft. etation is heing opened in order to proepect the ledge at that point. Considera-

blo water eweeps through from the Crown Point lower lovel, which is not as low as the lowest depth attained in the Yellow Jacket by 200 ft.

Hale & Norcross. — Daily yield 50 tons, mostly from the lower mine. The winzo connection is at last completed between the 1,400 and 1,500 ft. levels, giving good ventilation. The main incline is being sunk deeper for a new level.

Gould & Curry.—Main incline down 90 ft. below the tenth or 1,500 ft. level and good progress being made. The east drift at the 1,500 ft. level is in 175 ft., and the face only shows hard, barren porphyry and a little quartz and clay occasionally. Prospecting in other drifts at that level goes on well as usual.

Kentucky.—Daily yield between 50 and 60 tons from the old sections which are looking unusually well, with ore enough in sight for several months.

Savage.—Daily yield 200 tons; average value $28 per ton. Incline down about 75 ft. below the 1,500 ft level and progressing deeper at a satisfactory rate. This level is still being vigorously prospected with good hope of better developments.

Buckeye.—Daily yield 25 tons. The ore breasts are all looking first rate. The work of sinking the main incline is already commenced.

Silver Hill. The new hoisting works machinery is about all completed and in readiness to start up.

Chollar-Potosi—Daily yield 200 tons of $40, all from the old workings. The west Blue Wing shows well. The repairs to the main shaft are being driven ahead energetically.

Sierra Nevada.--Daily yield about 30 tons. A good streak of ore 3 or 4 ft. wide is worked in the lower part of the mine, which is yielding very well.

Overman.—Shaft 80 ft. below the 1,000 ft. level. Drift west at that level in 370 ft., with more promising indications the further in the drift is pushed.

Woonville.—The last run of 80 tons from this mine, yielded nearly $3,000, or over $36 to the ton. The ore body in the tunnel is looking finely.

Knickerbocker.—New shaft down 365 ft. Rock somewhat softer, allowing of better progress. Machinery and everything working well.

Sutro Tunnel.—Entire length 2,950 ft. Rock hard, but blasts well. Shafts along the line driving downward at a satisfactory rate.

Succor.—New shaft down 156 ft. Considerable water is encountered which interferes very materially with sinking.

Occidental.—Main drift still boing run north at the rate of from 3 to 5 ft. per day. Prospects good.

Jacon Little. — This mine on Cedar Hill is turning ont some extra fine ore, rich in both gold and silver.

WHITE PINE.

Treasore Hill Mines—South Aurora. White Pine *News*, June 29: The Diamond drill in the Scatterthwaite tunnel is doing good work.

Beecher Cons, M. & M. Co.—Working a force of 45 men; extracting 30 tons of ore per day. The Manhattan mill is running on ore from this mine, which is turning out fully equal to expectatione.

Original Hidden Treasure.—About 70 men are employed. The old dumps are being assorted and the ore shipped to mill. The Wheeler tunnel is pushed ahead with good speed. The ore in the open cut shows an improvement in grade. The Big Smoky mill is running steadily and giving good results.

East Sheboygan.—The principal work done since last report, waa in the north workings, breasting out west across the ledge between the Exchange and Regent drifts. The ore obtained is of good grade.

Copper Glance.—Rapid progress ia made in the north shaft by the contractors. A contract was let on the 26th, to rnn the lower drift ahead 105 ft., to connect the main and north shafts.

Sunbeam.—The ore body has improved in the shaft.

Eberhardt.—The usual force of men is at work breasting out in the chamber West of the Keystone shaft.

North Aurora.—The ore in the South chamber is showing finely, and holds out an even grade.

San Juan del Rio.—The shaft is going down rapidly in the ore body of the back ledge.

Silver Hill Mines.—Owyhee.—The grade of tho ore in the bottom of the shaft is higher than on the surfaco croppings.

Silver Plate.—Flowers, Colton & Co., are pushing work ahead, breaating out.

Western Slope of White Pine Mt.—The Trench, Caroline and several other mines are in full blast. The first-olass ore is shipped to Reno by the Trench Co. Bstches of the Caroline have been worked at the Eureka and Hamilton mills recently, which paid largely over expenses. A lot of third-olass ore from the latter-named mine waa worked at the Big Smoky mill, which yielded $300 to the ton. There is a report that the Monte Cristo mill will soon start up.

Outside Dists.—Robinson Dist.—This promising Dist., is fast filling np with prospectors, and capitalists are coming to the aid of the bone and sinew of the population. The furnace of the Canton M. & M. Co. is nearly completed, and will soon be in full blast.

Mills.—International. —Running 60 stamps on ore from the Eberhardt & Aurora Co's mines.

Swansea.—Running on ore from the Mammoth mine.

Manhattan.—Running steadily on ore from the Beecher Con. M. & M. Co.'s mines.

Big Smoky.—The full number of stamps is running on O. H. Treasuro ore, and working full np to tho expectation of the Supt. of the mill.

Arizona.

Mines and Mining—Mohave Co.—Prescott *Miner*, June 22: On Williams' Fork, the Planet and other copper mines are being worked with profit.

Yuma Co.—Ore from the Castle Dome Dist. is constantly being shipped to S. F.

Mariposa Co.—Mining is at a stand still, owing to the present breaking up of the camps in Panal Dist. by Apaches.

Yavapai Co.—The miners of the several Dists. around Prescott are more hopeful than ever, but the Indians are more hostile than ever, so that not much, in the way of mining and prospecting, is being done.

The Tiger, Beuton, Del Pasco, Benjamin, Canadian and Cornucopis lodes are being developed to the entire satisfaction of all who have seen them.

Ten pounds of Benjamin, recently worked, yielded $5 in silver.

A piece of ore from the Crescent lode, in Walnut Grove Dist., recently assayed in S. F., yielded at the rate of $1,000 per ton in silver. The lode is wide and the ore easily smelted.

The Vulture mine, near Wickenburg, is being operated upon and the mill is running, as usual.

Colorado.

Started.—Colorado *Miner*, June 27: The Stewart Amalgamation Works at Georgetown have started up. There are upwards of 600 tons of ore at the mill, and more coming every day. The capacity of the mill will be about 20 tons per day, or about 5,000 tons per year.

Arey Works.—The Arey works have started up. The crushing mill can crush and sample 30 tons per day.

Caribou.—Cor. Central *Register*, June 26: Dr. Monro and Fred Albright, have made a new discovery on the Caribou Hill, and name it M. M. Pomeroy. It shows a fine crevice, and looks exceedingly well for the depth.

Parker, Werley & Co., are sinking on a vein called the Horace Greeley, on Caribou Hill. It shows a large vein, with but little mineral.

David Hanna is hoisting a quantity of fine ore from a new discovery on Idaho Hill. It is down only 15 ft., and looks equally as well as the Silver Point, at that depth.

The Wide Awake lode, on Caribou Hill, is being worked with very promising results.

A. D. Breed is proving up the west end of the Caribou lode.

Breed & Cutter's mill at middle Boulder, started up yesterday, and will doubtless run constantly all summer. There is a large supply of ore at the mill, and the mines of that region are being actively worked.

Items.—Central *Herald*, June 26: Roberts & Co. are raising from the claim they operate on the Kansas, about 2 1-2 corda of 10-oz. ore daily. The ore taken out very recently from this part of this famous lode is looking better and yielding more largely from this mine for some time past. Four or five other claims on the Kansas are being successfully operated.

On the Kent Co., Bennett & Co., Nichols & Co., are mining with fair success.

Quails & Co., on the Centre, are raising ore which runs under the stamp from 5 to 14 ozs.

Capt. Phillips and Co. are sinking two shafts on the Jones' lode in Nevada, and taking out ore which yields 14 ozs. in the stamp mill.

Mr. Hawley, proprietor of the Gardner lode on Quartz hill, commenced mining operations on that mine yesterday.

From the Rhoderick Dhu, Mr. Scudder is taking out considerable quantities of fair milling ore, and some first-class smelting ore.

Some parties are just commencing work on some of the old mines about Nevada, and the prospects are favorable for the raising of increased quantities of ore in this dist.

Montana.

Moose Creek.—Deer Lodge, *New North West*, June 28: Parks & Dickey, who own and are developing the Dixie lead on Gold Hill, Moose Creek, are running 3 arastras, crushing 4 tons of ore per day, yielding $12 to $20 per ton. The lead is developing well, showing a crevice of 4½ to 5 ft., decomposed quartz, requiring no blasting; 3 men take out 8 tons per day. Marcean & Lapoint have 3 arastras running on Canadian ore, and are getting good pay. Falkner & Reynolds, and Dodge & Co., are placer mining on Moose, and making good wages.

Henderson Gulch.—Deer Lodge, *Independent*, June 29: The placer mines in Henderson gulch are paying as well, if not better than for several years. The Buckeye boys, Smith Bros., on Smart's Bar, made one clean up of $1,750 a few days ago; Ferguson & Co. have cleand up over $3,000 so far this season. O'Connor & Mastison, on Elkhorn Bar, made one run of $2,134; Hendersen & McAndrews, one of $1,100; Tom Smith & Co., one of $1,500; Terrill, Walwork & Co., one of $700, Carlton, Burus & Co. have made several large runs, and the Haley Bros. have been doing well. McDermott & Hennessy will make their first clean up this week, and a large one is expected. At present there are about 32 white men and 150 Chinamen at work on the gulch and bars.

Winchel, Hornbuckle & Co. have just started up their hydraulic diggings on Flint Creek Bar.

Carr, Farnham, & Co., on Maginnis gulch are drifting in the bed of the stream. They carry their flume up through the drain tunnel to the bed rock, a distance of 600 ft., and are thus enabled to work the entire year.

Utah.

Bullion.—Salt Lake *Tribune*, July 2: Durant & Cutting shipped during June, 840,000 lbs. east and west, making 7,600 bars. The value exceeded $100,000. Of this amount, 360,000 lbs. were shipped by the Winnemuck; 33,000 lbs. by the Flagstaff; 76,000 from the Saturn; 66,000 from the Utah. They expect to double the amount this month.

Ophir.—Correspondence same: The Cliff, on Ophir hill, shows a fine body of ore, and is being extensively worked. Large forces are on the Nsbob and Rip Van Winkle,—results—dumps stacked with tons of the metal. The mines in Dry Cañon are looking fine. The Mona, on Snow Storm Hill, has yielded some fine rock, within the past week. An average of ore, sold to the Ophir Smelting works, yielded 70 per cent lead and $700 in silver.

More of it.—The Highland Chief, in Little Cottonwood, is said to have opened out hugely within the last few days. It is stripped for 100 ft. on the surface, showing a well defined and continuous vein of ore, the lowest grade assaying $191, and the highest $300.

Reed & Benson.—This mine, is developing favorably. At a depth of 132 ft. a vein of ore 15 ft. wide, has been reached. The Co. has about 1,000 tons of ore on their dumps.

Bingham Canon.—Valuable discoveries are being made almost weekly in this dist. Prospectors have succeeded in getting on to a richer belt of mineral than heretofore, and some very fine mines are being developed. A very rich gold quartz lead was recently located by some fortunate parties which assays from $37.50 to over $326.00 in gold. One of the finest discoveries in the country was made the other day near one of Bingham's lofty peaks. The Agues, shows at 10 ft. from the surface an 18-inch vein of rich galena and chloride ore assaying from $165 to $700 in silver, and 12 to 18 inches milling ore besides.

New Incorporations.

The Silver West Consolidated M. Co—July 3. Location : State of Nevada. Capital stock, $5,000,000, divided into 40,000 shares. Trustees—Thomas J. Taylor, John Pershbaker and John W. Brummagim.

The Josephine Consolidated S. M. Co.—July 9. Location: Philadelphia M. District, Nye county, Nevada. Capital, $2,500,000, divided into 25,000 shares. Trustees—F. F. Coffin, V. Fernbach, James Stuart, J. W. Gashwiler and George Hearst.

Golden Rule S. M. Co.—July 10. Location: Ophir District, Utah. Capital, $2,000,000, divided into 20,000 shares. Trustees—John Malone, J. P. Sanders, Felix Uri, Henry E. Mayer and M. Wertheimer.

The Gold Canon Consolidated M. Co. filed a certificate of increase of capital stock on the 10th inst. from $700,000 to $3,500,000.

Meetings and Elections.

The Newark Mining Company elected the following Trustees on the 8th inst.: J. S. Wall, S. Heydenfeldt, J. A. Garniss, A. Young and W. Blanding.

The Utah Mining Company met on the 9th inst. and elected A. K. P. Harmon, C. B. Land and John Skae as Trustees.

The Altona, No. 1, Gravel Mining Company, of Grass Valley, have elected the following Trustees: Wm. K. Squires (President;) Peter Brandow (Superintendent,) David F. Dodge, Rufua Shoemaker, and David Wilder (Secretar.)

The Chollar Potosi Mining Company, at the recent annual meeting held on the 8th inst., re-elected the following officers: Trustees: A. K. P. Harmon (President;) J. D. Fry, Alpheus Bull, William Norris, H. C. Kibbe, James Freeborn, and James H. Dobinson; Secretary, W. E. Dean; Superintendent, I. L. Requa.

The Norman Mining Co., have elected the following Trustees: W. G. Wayman (President), Benjaman Dore, M. D. Plummer, J. M. Thompsou and E. J. Moore. W. H. Watson was continued as Secretary.

The Overman Mining Co. met on the 11th inst, and elected the following Trustees: Geo. W. Bever (President), R. F. Morrow, (Vice-President, A. K. Harmon, M. I. McDonald and Hiram Tubbs. Thos. J. Owens was re-elected Secretary.

Mining Shareholders' Directory—Meetings, Assessments and Dividends.

[Compiled weekly from advertisements in the Mining and Scientific Press and other S. F. journals.]

A Treatise on Railway Curves and Locations. By E. W. Beans, C. E. Henry Cary Baird, Industrial Publisher, 406 Walnut street, Philadelphia.

The above is the title of a small edition of a work very useful to Railway Engineers, and one which appears to contain considerable matter entirely new, and which will greatly assist the locating engineer, and facilitate his labors. The work is illustrated with numerous diagrams, and contains demonstrations and tables, showing how engineers may save themselves many laborious calculations and much expense for their employers. The last chapter or proposition, is devoted to grading hills and unequal surfaces for turnpikes, plank roads, etc. Price, $1.50, sent by mail, free of postage, to any part of the United States.

Weights and Measures.

As recognized by the laws of the United States.

Bushel.	Pounds.	Bushel.	Pounds.

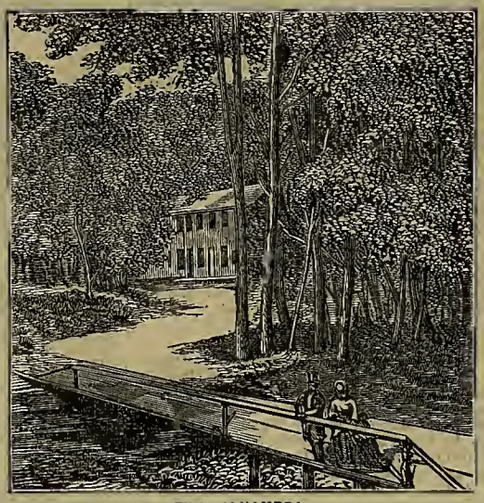
A box 24 by 15 inches, 22 deep, contains 1 barrel.
A box 16 by 16½ inches, 8 deep, contains 1 bushel.
A box 8 by 8¾ inches, 8 deep, contains 1 peck.
A box 4 by 4 inches, 4½ deep, contains ½ peck.
A box 4 by 4 inches, 2 2-10 deep, contains 1 quart.

The standard bushel of the United States contains 2150.4 cubic inches. The "Imperial bushel" is about 68 cubic inches. Any box or measure, the contents of which are equal to 2150.4 cubic inches, will hold a bushel of grain. In measuring fruit, vegetables, coal and other substances, one-fifth must be added. In other words, a peck measure five times even full makes one bushel. The usual practice is to "heap the measure."

White Sulphur Springs.

When summer, which ie anxiously awaited in moet other climes, comes to the citizens of San Francisco, it is the signal for those who can afford the time and money, to wend their way to eome of the numeroue watering places to get rid of the hot mornings and etill more dieagreeable, windy, duety aud foggy afternoone. The majority of the Eastern cities have their heated terme, when to be in town is to he out of the world for the aristocratic portion of the community; but here in the metropolis of the Pacific Coast we rather seek a warmer climate for a change and at the same time ehun the winds and are enabled to enjoy a hot day in some rural retreat far from the hum and bnstle of the city. Fortunately, Californians can have almost any climate they d sire and at any time of the year, without going out of the borders of their own State; and to a stranger this variety seeme somewhat remarkable, especially when so great a change can be seen in a comparatively short distance.



THE ALHAMBRA.

The watering places are in their glory at this time of the year and the conntry is filled with city visitors in pureuit of pleasure, change and recreation. Among theee places of resort, the White Sulphur Springs of Napa County hold a prominent position both on account of their being eaey to get to from San Francisco and the beautiful scenery, fine climate and the reputation of the watere. Our correspondent, "L. P. Mc.," who has recently made a trip in that direction, hae furnished us with a few notes to accompany the illustrations given herewith.

How to Get There.

The Springs are situated in Napa County, eighteen miles distant from the Conuty seat in a romantic cañon, fifty seven miles from San Francisco. They are two miles west from St. Helena, at which point a stage line communicates with the Springs. The tourist takes the eteamboat at Broadway Wharf either at 7.30 A. M., or 4. P. M., and is landed at Vallejo in an hour and a half or two houre, where he takes the cars for St. Helena *via.* Napa; fare, $3. From St. Helena by stage or hack over a short bnt beautifnl road to the Springs, two miles; fare, 50 cents. Auother drive to the Springs from St. Helena, may be taken by what is known as the Avenue, which goes direct south one mile; then west one mile; then north one mile; and then a little northwest half a mile, meeting the main road. This road is frequently taken by private teams on accouut of the beauty of the route. The last 2½ miles runs through a wooded country heantifully studded with residences and vineyards, and the avenue is entirely shaded by the thick foliage overhanging it. The fine recidences of Dr. G. B. Crane, G. Backue, John Lewelling, and a number of other places in course of construction are passed on the way.

The Hotel and Cottages.

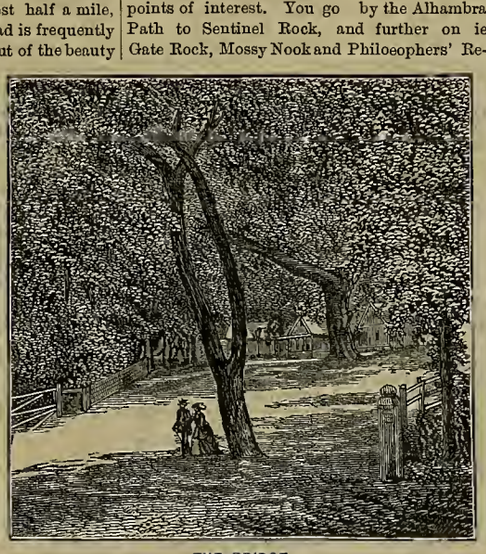
The cut shown in the centre of the page is a faithful representation of the hotel, which ie kept by Mr. S. Alstrom, and which afforde all the comforts to be found inside of San Francisco. The table ie well kept, the rooms airy, aud the beds clean and inviting. There are pleasant walks and shady retreats. A numher of cottages and buildings serve to make quite a pretty little picture of rural scenery. The charges here are reasonable, and one may either live in the maiu hotel or in a cottage as he desires. The accompanying cuts represent a few of these cottages, which eerve to show the beauty of the situation of the Springs aud arrangemeut of the accommodations.

The Surroundings

Of the place are all that could be wished for by any one seeking for a quiet retreat, a pleasant climate and beautifnl scenery. The hills around are covered with foliage and invite one to a walk to enjoy the shade in midday, or in the evening to lie under the spreading branches aud dream away the "cares that infeet the day." From the top of Columbine Hill, the manzauita path leads to Madroña Hill, 800 feet above the hotel. A little further on to the right this ridge raises 50 feet more and is called Prospect Hill. From this point, as its name implies, a splendid view is obtained. On the south side there are a numher of points of interest. You go by the Alhambra Path to Sentinel Rock, and further on ie Gate Rock, Mossy Nook and Philoeophers' Retreat. At a place on the ridge, 946 feet above the hotel, another fine view presents itself, and one can see from here the mountaine in the distance, the Sonoma Valley, and even San Francisco.

THE VANDEWATER COTTAGE.

THE HOTEL.



THE BRIDGE.

Analysis of ths Waters.

The waters are said to be beneficial in cases of rheumatism and numerous other afflictions which flesh is heir to. There are nine of the springs, the water from which, like most medicinal and mineral waters ie unpleasant to the taste, but a short sojourn at the place accustoms one to their use so that he really enjoys the flavor. We give herewith the anyalysis of the waters, which was recently made by Prof. John Le Conte, of the State Uuiverity.

All of the springs contain esseutially the same ingredients in the variable proportions. The low sp. gravity of the waters of the springs, as well as the results of analysis, indicate the presence of comparativcly small amouuts of saline materials. They are, therefore, peculiarly sulphnrous waters, belonging to the light class. The quantity of sulphur in the waters for all medical puposes, being fully equal in strength to some of the most celebrated sulphur waters of Europe and this couutry; those of Aix in Savoy; of Bagneres in France; of Harrowgate in England; of Moffat in Scotland; of Sharon in New York; of the White Sulphur Spriugs in Virginia, and others.

Most of the sulphurous waters of Great Britain are cold, but the greater numher of the most famoue springs on the continent of Enrope are either hot or warm. The temperature of Spring No. 1 (97¼° F.) ie nearly the same as that of the celebrated springs of Baden Baden near Vienna. The notable difference in the temperature of the several springs depends, probably, upon the greater or less abundance of the flow of water. It will be noticed that those furnishing the largest supply of water, as Nos. 1, 2 and 6, have the higheet temperatures. If a large quantity of water could be diverted into any one of the springs, the tempcrature would, probably, rise up to blood heat.

The department of mineral waters containing free sulphuretted hydrogen is of some interest in relation to their use. The characterietic odor of such watere is well known. They are ueually clear when first takeu from the spring; but when kept in a vessel containing air, sulphur eeparates in the course of eight hours or more, the fluid turning turhid, or depositing a whitish precipitate, whilst the smell of sulphuretted hydrogen becomes fainter. After longer exposure the continued action of the air generally oxidizes the separated sulphur, converting it into sulphnrous acid, which dissolves, leaving the water again clear, as at first.

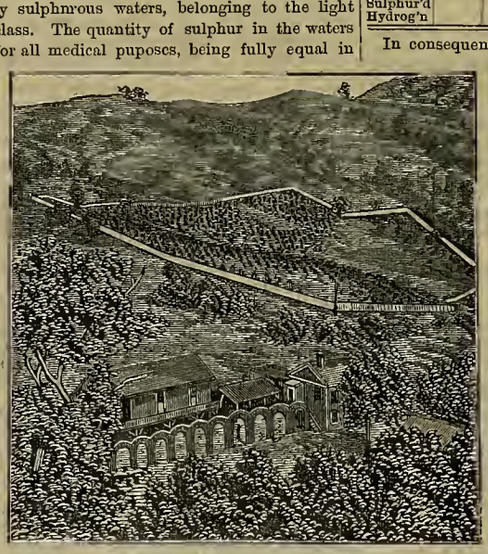
In consequence of the changee induced by the action of the air, in order to secure the full benefit of snlphur waters, it is essential that they be taken at the spring or very soon after withdrawal from the fountain. In slow-running springs, as numhers 3, 7, 8 and 9, ncarly all the sulphuretted hydrogen seems to be removed by the action of the air; the sulphur of this gas being replaced by sulphuric acid.



THE LAUNDRY AND VINEYARD.

Gold ann Coal in India.—The Rangoon (E. I.) *Gazette*, of the 9th of April, publiehes the following brief but important announcement: General Pollock has remitted to Calcutta several specimens of gold-bearing quartz found in the neighborhood of Candahar. Mineralogists consider that the strata must contain the precious metal in rich proportion and considerahle quantity. Coal mining operations are heing energetically pushed on in the Nizam's dominions. The results up to date are said to he satisfactory.

Julian District.—New machinery for putting five more etamps into the mill of the Stonewall mine, has recently been shipped to Julian City, San Diego conuty. The mine helongs to A. P. Frary, and is one of the most promising in the lower country.

Useful Information.

Paradoxes.

Water thrown into a red-hot metallic vessel does not boil, as we should expect, but quietly gathers itself together, forming a more or less perfect sphere, and in that condition floats about gracefully on the hot surface as it slowly evaporates away. If at the same time a very evaporizable substance, as liquid sulphurous acid is thrown in, the water may actually be frozen in the red-hot vessel.

Water boiled in a glass flask until the upper part of the vessel is entirely filled with steam, and then dexterously corked before air can gain admission and placed in cold water, recommences to boil. The boiling is produced by cold instead of heat, and the experiment is known as the culinary paradox.

If steam from water boiling at 212° is passed into a solution of a salt in water, the temperature of the salt solution steadily rises, passing 212°, reaches the boiling point of the solution, and finally the latter also boils at a temperature as high and even higher than 250°, according to its nature. There we have the extraordinary result of obtaining a higher temperature, say 250°, from a lower one, viz., 212°.

If there is anything in nature that possesses a positive character it is light. Yet the physicist may so reflect the light from a given source as to cause it to destroy itself and produce darkness. In like manner two sounds may be made to interfere with each other and either produce silence or increased intensity of sound, at the will of the operator.

How Pencil Leads are Made.—Graphite, clay and water are the materials used. The finest graphite, after being finely ground, is mixed with a peculiar blue clay, found only in Bavaria, and the whole kneaded with water to the consistency of putty. This mess is placed in a strong cylindrical iron vessel, in the bottom of which is a hole of the diameter of the lead desired. A plunger forces the mixture out through this small opening, which is received on metallic sheets, which, when filled, are placed in an oven for baking. The softness or hardness of the pencil depends upon the degree of hardness to which the baking is carried. The leads are afterwards broken up into the sizes required. Nine different sizes of leads are made, and numbered from 1 to 9. The trade is mostly supplied from manufactories in Philadelphia.

Durable Soap Bubbles.—To obtain soap-bubbles that will show the changing colors of the rainbow, the directions are as follows: Take half a pint of water that has been boiled and become cold, and put into it a quarter of an ounce of Castile soap, cut up fine. Put this into a pint bottle, and set it in hot water in a saucepan, on the fire; there let it remain an hour or so, now and then give it a good shaking till the soap is dissolved. Let the fluid stand quiet for the impurities and coloring matter of the soap to settle; then pour off the fluid and add to it three or four ounces of glycerine and your soap-bubble solution is ready. In an ordinary way you may blow the bubbles easy with a tobacco pipe, but if you wish to attain scientific perfection, you had better employ a glass pipe. By adding a larger quantity of glycerine you may make these bubbles so strong that you can play battledore with them.

A Pretty Experiment.—It is well known that a light ball, as of cork, may be sustained for some time near the summit of a vertical jet of water, when such jet is steadily maintained. The experiment becomes more striking when a vertical blast of air, issuing from a large bellows is substituted for the water; as in this case there is no apparent support for the ball, which comports itself in a very amusing manner in mid air.

When a strong blast cannot be obtained, if a slender wire, about four times the length of the diameter of the ball, be passed through its center so as to have one-fourth its length projecting from one end, and one-half from the other, the balancing is more readily obtained, as any considerable change in the relative positions of the center of gravity and the point of support is prevented by the movement of the rod.

To Make Mucilage.—An excellent quality of mucilage can be made of gum Arabic and water. No other ingredients are necessary. It will be thick and sticky or thin and watery, according to the proportions of gum and water. If not thick enough, add more gum; if too thick for convenient use, add more water. The second quality of gum (usually five cents per ounce) answers as well as the first quality, although it is not quite as clear. The difficulty with the purchased article of mucilage is that there is a deficiency of gum—water being more profitable to sell than gum.

The rattle of the rattlesnake is for the purpose of imitating the sound of the Cicala and other insects that form the food of many birds, and so attract the latter within the reach of the serpent; so says Professor Shaler.

Coal vs. Man Power.—The combustion of 300 pounds of coal under a steam boiler will produce a power equal to the mechanical force exerted by a man for an entire year.

Paint for Metallic Roofs.—In selecting a paint that is to be applied to metallic roofs, we should have regard not only to the preservative qualities of the paint, but to its relations to heat and light. Those who have had experience in the matter, know that the lead paints (white lead, red lead, etc.) do not form a good covering for metals. Indeed, in many cases they have been found to promote the corrosion of the metal to which they have been applied. This probably arises from the fact that when ordinary lead paints are mixed with oil, the oil forms a chemical compound with the oxide of lead, and the carbonic acid of the carbonate of lead is set free. We should expect, therefore, that the nascent carbonic acid would act upon such metals as iron, zinc, etc., and we must remember that ordinary tin plate consists chiefly of iron.

Lead paints are therefore to be avoided as being corrosive, and so are some greens and blues, as they contain copper in a form which readily yields its acid to iron or zinc. Our only safety, therefore, lies in the use of earthy or ochreous paints, and of these we should select those that are of a rather light color. Pure white or even very light colors are objectionable from the fact that a white roof has a very disagreeable appearance; while on the other hand a black roof will become so hot that the paint will blister and peel off.

Neutral grays are not only least obtrusive, but least powerfully acted on by the sun's rays, and should therefore be selected.

Cement for an Aquarium.—One of the correspondents of the *Rural New-Yorker* inquired recently concerning a cement for an aquarium, and is advised to use red lead putty. There is, however, a cement known as "aquarium cement," which adheres so firmly to glass and iron that there is no possibility of breaking it off. It forms a perfectly water-tight joint, and it does not taint the water as many lead cements are apt to do. To prepare it take equal measures of fine sharp sand, plaster of Paris and litharge; mix them well together and make them into a stiff putty with boiled linseed oil. Apply in the same manner you as would any other putty, and allow two or three days to dry. As regards the materials, any clean, fine and sharp sand will answer.

Cement prepared as above is exceedingly useful for more purposes than making aquaria. For stopping leaks around chimneys, and for many other uses that will readily suggest themselves, it is invaluable.

How to Fasten Rubber to Wood and Metal.—As rubber plates and rings are now-a-days used almost exclusively for making connections between steam and other pipes and apparatus, much annoyance is often experienced by the impossibility or imperfection of an air-tight connection. This is obviated entirely by employing a cement which fastens alike well to the rubber and to the metal or wood. Such cement is prepared by a solution of shellac in ammonia. This is best made by soaking pulverized gum shellac in ten times its weight of strong ammonia, when a slimy mass is obtained, which in three to four weeks will become liquid without the use of hot water. This softens the rubber, and becomes, after volatilization of the ammonia, hard and impermeable to gases and fluids. *American Artizan.*

The Watery Depth.—Water has been proved to be more compressible than some solids. Its density increasing, therefore, as the depth increases, there is a theoretical depth a which water would become as dense as, say, iron, and at which, therefore, iron would cease to sink. Practically, however, it is probable that there is no depth in the ocean to which any known solid that sinks at the surface will not descend.

One of the most marked of organic differences between the sexes is that of muscular action. No one who carefully watches the muscular acts of women will fail to perceive a tendency to do them with a sort of rush, with a superabundance and sudden exertion of force, rather than by the gradual application of the precise amount by which the end in view can be secured.

Softening Old Putty.—In removing old broken panes from a window, it is generally very difficult to get off the dry, hard putty, that sticks around the glass, and its frame. To obviate this, dip a small brush in nitric or muriatic acid, and go over the putty with it. Let it rest a while, and it will soon become so soft that you can remove it with ease.

To Protect Walks from Weeds.—Take one gallon of gas-tar and about half a pound of air-slacked lime, boil and incorporate them well together, then apply the mixture with a common long-handled whitewash brush. This will dry in a few hours if put on boiling hot, and will kill off all the young weeds and prevent their growth.

The Microscope reveals to us the fact that the surface of our bodies is covered with scales like a fish; a single grain of sand would cover 150 of these scales, and yet a scale covers 500 pores. Through these narrow openings the sweat forces itself like water through a sieve.

Hint for Mechanics.—Ed. Skinner Middleton, New York, says by rubbing chalk on a square the lines and figures are filled up, and can be much more plainly read. This is especially useful for near-sighted persons.

Good Health.

Apples Very Wholesome.

Many persons do not value apples sufficiently as an important article of diet. Besides containing a large amount of sugar, mucilage, and other nutritive matter, this fruit contains vegetable acids, aromatic qualities, etc., which act powerfully in the capacity of refrigerants, tonics, and antiseptics, and when freely used at the season of mellow ripeness prevent debility, indigestion, and avert, without doubt, many of the "ills which flesh is heir to." The operators of Cornwall, England, consider ripe apples nearly as nourishing as bread, and far more so than potatoes. In the year 1810—which was a year of much scarcity—apples, instead of being converted into cider, were sold to the poor, and the laborers asserted that they "could stand their work" on baked apples without meat; whereas a potato diet required either meat or some other substantial nutriment. The French and Germans use apples extensively, as do the inhabitants of all European nations. The laborers depend upon them as an article of food, and frequently make a dinner of sliced apples and bread. There is no fruit cooked in as many different ways in our country as apples, nor is there any fruit whose value, as an article of nutriment, is so great.

An old gentleman recently stated to us that every fall he used to have a severe sickness, but since he bought, during the season, a barrel of good apples, for himself alone, and ate the whole barrel in two or three months, he had every year saved himself from this sickness without wanting a doctor.

Liebig on Apples.

Justus Liebig, the great chemist, thinks that the importance of apples as food has not been sufficiently estimated or understood. He says: "Besides contributing a large proportion of sugar, mucilage and other nutritious compounds in the form of food, they contain such a fine combination of vegetable acids, extractive substances and aromatic principles as to act powerfully in the capacity of refrigerants, tonics and antiseptics; and when freely used at the season of ripeness, by rural laborers and others, probably maintain and strengthen the power of productive labor."

Take Care of Your Health.—Few people realize what health is worth until they lose it. It is easier to prevent disease than to cure it. The character of our farming is undergoing changes. We are using more machinery, keeping better stock, raising choicer varieties of fruit, grains, potatoes, roots and grasses; are buying more or making better manure. Now, all this requires *brains*. We are aware that there is a great deal of nonsense written on this subject. But it is undoubtedly a fact that a man cannot long use his brains as an intelligent, enterprising American farmer is now compelled to do, and work and worry at the same time, without abundance of nutritious food. If he undertakes to do it on fat pork, potatoes, bread, and cake, his health will certainly give way. The American farmer of today needs and must have more fresh meat. Better patronize the butcher than the doctor; better sell fewer eggs and buy less medicine. We have heard a farmer say: "Food that is good enough for my men is good enough for me." He may have been right. But the farmer who *thinks* and works too, needs better food and cooking than he who merely works with his hands.—*American Agriculturist.*

Use of Fruit.—Instead of standing in fear of a generous consumption of ripe fruit, one should regard it as decidedly conducive to health. The very disease commonly assumed to have their origin in the free use of all kinds of berries, apples, peaches, cherries, pears and melons, have been quite as prevalent, if not equally destructive, in seasons of scarcity. There are so many erroneous notions entertained of the bad effect of fruit, that it is quite time a counteracting impression should be promulgated, having its foundation in common sense, and based on the common observation of the intelligent. No one ever lived longer, or freer from the attacks of disease, by discarding the delicious fruits of our country. On the contrary, they are very essential to the preservation of health, and are therefore given to us at the time when the condition of the body, operated upon by deteriorating causes not always comprehended, acquires their grateful, renovating influences. Unripe fruit may cause illness, but fresh, ripe fruit is always healthful.—*Country Gentleman.*

Embalming Among the Egyptians.—Dr. Benjamin W. Richardson, in a lecture upon the science and art of embalming the dead, remarks that three different methods were practiced among the Egyptians. First, embalming proper, by the introduction into the body of certain odorous essences or antiseptics, aided by after-immersion in saline solutions; second preservation by simple extraction of water from the tissues; third, by the injection of preservative solutions into the blood-vessels. He remarks that the first of these methods includes the true Egyptian and Greco-Egyptian process of preservation, as detailed at full length by Herodotus, and consisted essentially in eviscerating the body and employing aromatic preservatives, and in exposure to a solution of common salt, possibly with the addition of some soda.

Friction.—One of the most gentle and useful kinds of exercise, is friction of the body, either by the naked hand, a piece of flannel, or what is still better, a flesh brush. This was in great esteem among the ancients, and is at present among the East Indies. The whole body may be subjected to this mild operation, but chiefly the belly, the spine, or backbone, and the arms and legs. Friction clears the skin, resolves stagnating humors, promotes perspiration, strengthens the fibers, and increases the warmth and energy of the whole body. In rheumatism, gout, palsy, and green sickness, it is an excellent remedy. To the sedentary, the hypochondriac, and persons troubled with indigestion, who have not leisure to take sufficient exercise, daily friction cannot be too strongly recommended as a substitute for other means, in order to dissolve the thick humors which may be forming by stagnation, and to strengthen the vessels. But, in rubbing the bowels the operation ought to be performed in a circular direction, as being most favorable to the course of the intestines, and their natural action. It should be performed in the morning, on an empty stomach, or, rather, in bed, before getting up, and continued at least, for some minutes at a time.

Warm Bath in Insanity and in Burns.—Dr. Wilkins in his *report* to the California Legislature, on Insanity, refers to the warm bath as a favorite treatment in Italy and in some parts of Holland and France. He often saw a dozen patients in one bath-room with their heads alone in sight, the bathing tub being covered except a hole for the head. There they usually remain from one to three hours, in some instances from six to eight hours, and occasionally for days at a time. Dr. Gudden, of Zurich, kept a man thus immersed for five days, on account of excitement connected with bed-sores. The patient is reported to have slept well during a portion of the time, and to have been cured of the sores. No exhaustion or ill consequence followed. A case is related of a man scalded by steam, and not insane, who was placed by Hebra in a tepid bath and kept there for three weeks, until a new cuticle had formed over the entire surface. This patient recovered without inconvenience. The water was kept at a temperature most agreeable to the patient. Thus employed it is said to relieve effectually the extreme pain from the burns.

Xylol in Small-Pox.—A good deal of interest has been excited by the published success of xylol dimethylbenzol, one of the many products of the distillation of coal-tar as a remedy for the small-pox, for which it has been applied for a considerable time in Berlin by Dr. Zeulzer. The experiments are stated to have proved very satisfactory, and its use in one of the principal hospitals of Berlin is becoming very extended. The dose of this substance for an adult is from ten to fifteen drops, and from three to five for children, every few hours. No injurious effect has hitherto been noted, even when given in considerably greater quantity. It is applied from the earliest period of the disease till the complete drying up of the pustules. The best method of administering the xylol is in capsules, which are now furnished, containing three, eight, and twelve drops, although it can be given drop by drop in wine or water. Toluol appears to have no effect.

Eat Fruit—Fruit vs. Liquor.—The late David Thomas often made the remark that within the circle of all his acquaintances, he did not know a person who was decidedly fond of good fruit, who became an intemperate man. He considered the two tastes as distinct and antagonistic. There is undoubtedly much truth in this remark. It appears that there is a natural demand in the system for fruit, and this demand not being always met, many are tempted to fill this vacancy by drinking alcoholic liquors. One of the best things we can do, therefore, while we urge the positive influence of temperance principles, and the prevention of an intemperate appetite by abstaining entirely from the sipping of liquor, we may endeavor, by the extended culture of fruit in all its kinds—so as to extend the circle of supply throughout the year—to assist this benevolent exertion by lessening or decreasing the temptation to supply its lack above stated.

A Novel Small-Pox Theory.—A German physician has lately started the theory that the fearful disease known as small-pox originates from an excess of albuminous matter in the blood, and that this is to be prevented by the administration of common salt. The habits of children in indulging too freely in sweetmeats he considers one great cause of this undue development of albumen, and coffee and tea, if highly sugared, tend also to excite it in adults. An organic acid such as lemon juice, he considers the best means of freeing the blood, when clogged with too much albumen, and he alleges that by taking these simple remedies in the way of precaution, he has for upwards of twelve years past, frequented or taken up his abode in the most pestilential small-pox hospitals of Europe and South America with entire impunity.

Poison Oak.—Somebody recommends as an antidote for poison oak a salve made of equal parts of butter, salt, and saleratus; and that a person who expects to be exposed to the poison oak, should take a small box of this salve with him, and slightly anoint the hands and face. This will oftentimes prevent the poison taking effect; but if it has taken effect the salve is a sure and speedy cure.

MINING AND SCIENTIFIC PRESS.

SUBSCRIPTION AND ADVERTISING RATES.

Advertising Rates —1 *week.*	1 *month.*	3 *months.*	1 *year.*
Per line..... .25	.80	$2.00	$5.00
One-half inch.....$1.00	$3 00	7.50	20.00
One inch..... 2.00	5.00	14.00	38.00

Large advertisements at favorablo rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper, inserted at special rates.

Subscriptions payable in advance—For one year, $4; six months, $2.50; three months, $1.25. Clubs of ten names or more, $3 each per annum. $5, in advance, will pay for 1¼ year. Remittances by registered letters or P. O. orders at our risk.

English and Colonial subscriptions, post paid, per year, £1 3s.; 6 months, 12s. Advertisements, per line, first insertion, 1s.; subsequent insertions, each, 8d. Large advertisements at special rates.

Illustrations and Reports of Mining Enterprises Wanted.—Drawings or photographs of mining works that are of general interest to our readers are solicited for publication in this journal. Official reports of Companies, and description of mines of importance, of special interest, are also desired. Sketches of any new method and discoveries will be very acceptable.

Gold and Legal Tender Rates.

San Francisco, Wednesday, July 10, 1872.—Legal Tenders buying, 88¼; selling, 88¾. Gold in New York to-day, 113¼.

Table of Contents.

ILLUSTRATIONS.—Portable Drilling Machines, 17. White Sulphur Springs, 22. Coast and Interior Surface Geology, 25.

EDITORIALS.—Arizona and the Apachee, 17. Silicon Steel; Determinative Mineralogy, 24. Silk—Now for Information; Chollar Potosi M. Co., 25.

CORRESPONDENCE.—Meteorology of San Joaquin Valley, 19.

SCIENTIFIC PROGRESS.—Recording Musical Notes; Star Depths; Future Eclipses of the Sun; Determination of Hight of Auroras; Reversal of Spectrum Lines of Metallic Vapors; Germination Appropriation for Astronomical Purposes; Petroleum in San Domingo; Copper in Cocoa, 19.

MECHANICAL PROGRESS.—Improved Iron Processes; Krigar's Cupola Furnace; Advantage of Labor-Saving Machinery; The Different Methods of Making Steel; Mechanical Progress; Mammoth Car; Car Starter; The Baltimore Tunnel; A Pressure Gauge for Guns; The Dank's Furnace, 19.

MINING SUMMARY.—Reports from mines in various States, Countiee and Districts; Mining Shareholders' Directory, 21-22. Stock Reports, and Markets, 28. New Incorporations; Meeting and Electione, 21. Extensive Mining Sale, 25.

USEFUL INFORMATION.—Paradoxes; How Pencil Leads are Made; Durable Soap Bubbles; A Pretty Experiment; To Make Mucilage; Paint for Metallic Roofs; Cement for an Aquarium; How to Fasten Rubber to Wood and Metal; Softening Old Putty, 23.

GOOD HEALTH.—Apples Very Wholesome; Take Care of Your Health; Use of Fruit; Embalming among the Egyptians; Friction; Warm Bath in Insanity; Xylol in Small-Pox; Eat Fruit—Fruit vs. Liquor; A Novel Small-Pox Theory; Poison Oak, 23.

DOMESTIC ECONOMY.—Are Tin Fruit Cans Injurious; Put Up Your Jam While Hot; Cooking Eggs; Okra or Gombo; Fresh Vegetables and Sweet Salads; Use White Cheese; The Poetry of the Table; Selected Receipts, 26.

MISCELLANEOUS.—Bullion Product for 1871; Mining; The Great Blue Gravel Company; Stamp Duties Abolished; Silver Zone District, 18. Notices to Correspondence, 24. Patents and Inventions, 28.

Notices to Correspondents.

We have received several letters from different parts of the country asking about a cement suitable for mending waterproof boots. The substance known as the "Miners' Rubber Cement" is very effective and answers the purpose perfectly. We have seen it tried in a manner that left no doubt of its efficacy. The trouble has been that parties using it have not followed the directions, and some fault has been found. The vulcanized matter must be first thoroughly removed by washing with turpentine or scraping with a knife. The boots should be dry, and paper inserted to answer the purpose of a last. The patches should be made neatly, the cement applied and the parts rubbed well together. Then place three or four thicknesses of paper on the outside of the patches and bind them on for, from 12 to 24 hours; remove the twine and paper and expose to the air until perfectly dry. By following these directions, which are very simple, the patch will exclude the water perfectly. When the flask containing the cement is not in use it should be kept tightly corked. The parties manufacturing the article in this city were burnt out on the 4th of July, and not knowing where they will locate as yet, we can give no address.

Extension of Blake's Quartz Crusher Patent.—This patent, it will be seen, under the heading of Patents and Inventions, has been extended for seven years.

On File.—"Notes of travel in Lander and Elko counties, Nevada." "The Alpine *Miner* and Metallurgist."

New Process of Manufacturing Steel—"Silicon Steel."

The rapidly increasing demand for cheap steel and iron, and the large returns which await any important improvement in their manufacture has proved a most powerful incentive to inventors to do their utmost in devising means for the more economical and perfect manufacture of these indispensible products. Millions of money have been spent in such endeavors, and the records of the Patent Office show about 3,000 patents on file which claim improvements in this direction. But with few exceptions all these alleged improvements have proved impracticable when submitted to proper test. The famous and well-known Bessemer process, however, has been found to be of great value, and the more recent and comparatively new Danks' process, promises almost, if not equally satisfactory results in another direction. And now we have still another applicant for public favor, in the "Nes Silicon Process," which, according to its promoters, promises results of the highest importance to the commmercial world.

The Bessemer process is attended with a heavy drawback, inasmuch as it is founded, in the fact that all iron submitted thereto must first be deprived of *all* its carbon, and then a certain known percentage added by the introduction into the melted mass of a given quantity of a peculiar and quite expensive compound (Franklenite or Spiegeleisen) rich in carbon. Although this process is much cheaper than the old Swedish blistering method, still it is attended with great cost, and an immense outlay of capital at the start for machinery, etc.

The Nes Silicon process, on the contrary, is said to be extremely simple, and must be so if the details of the process, and consequent results are correctly given by the owners of the patents. This process consists simply in melting common pig iron in an ordinary puddling furnace, and mixing therewith a certain quantity of a very cheap compound known as "silicon ore," (an oxide of iron,) the product being a very superior steel. The philosophy of the process, as claimed, is that the ore serves as a purifier of the iron—the carbon, sulphur, and phosphorus uniting with a portion of the silicon, and passing off in slag, while the balance forms a uniform combination with the iron, which is thus transformed into "silicon steel."

This steel is claimed to be quite a new product—differing both in its composition and behavior from any steel heretofore produced. It contains less carbon and more silicon than any other.

Its properties are claimed to be superior to either the Bessemer, the ordinary blistered, or common cast steel. While ordinary steel is deteriorated by frequent heating, in the loss of carbon, the "silicon steel" is not injured by such loss, by reason of the presence of silicon, which resists the ordinary action of fire, and to which that steel is said to chiefly owe its superiority. It can be welded to itself or to iron in a most perfect manner, and without the use of any flux—a great advantage in many of the purposes to which steel and iron are put, and especially in the manufacture of steel-headed nails. In fact it is claimed that all steel rails can be made about as cheap by this process as iron ones.

It is claimed that the tensile and breaking strength of "silicon steel" rails is much greater than rails made from Bessemer steel. According to published reports, while the Beesemer rail breaks under two or three blows of a steam hammer, the same size of "silicon rail" will often stand 100 blows from the hammer, and then bend before breaking. It is also claimed that this steel "never rusts, but always shines like silver"(?).

The term "Nes" is from the name of the discoverer, Dr. Chas. M. Nes, of York, Pa. Much interest seems to have attached to this discovery which was made some two or three years ago, and a large establishment for making steel, and steel rails, has been put up at Rome, N. Y., by the company which owns the patent for the express purpose of showing the practical working and value of the process, and where iron masters from all parts of the world are freely invited to come and satisfy themselves with regard to the value of the discovery.

The company consider themselves amply secured from infringement by the several patents which have been taken out to cover the various parts and portions of the invention, and the devices and use of the ore by which it has been made valuable.

All the various processes pertaining to the invention can be seen and studied at the above named works, and the exact cost of the manufactura and the machinery and appliances therefor carefully calculated. It is said that steel can be made by this process in one hour, with a certainty of uniformity throughout, and which will work soft and fine, and temper and harden well at a very low heat.

We have thus given, at considerable length, what is set forth by the proprietors of this process, as to the character and value of this alleged "new product." We have not seen any of the steel, nor any scientific testimony as to the correctness of what is claimed, as to the chemistry of the process, although the company's circular contains a number of certificates from different persons who have used their steel, as to its character and value for the various purposes to which the parties have subjected it. The manner in which the company has sought to introduce their steel to the world appears to be open and above board. All are asked to come and see and judge for themselves. If what is claimed is true, the invention is a valuable one and marks another important step in the direction of that great desideratum—a cheap and good steel. We shall watch further developments with interest.

Determinative Mineralogy.

[Concluded from issue of June 29.]

Before this can be fully understood, the properties of minerals should be carefully studied, not only *read* over, but the reactions described, impressed upon the mind by experiment; and it would be well to fully realize the statement made in the commencement of this article, that "a true mineral species is homogeneous," that is to say, the smallest fragment must be the same in composition as the whole mass; any other form of mineral substance is a *mixture* of minerals, and any attempt to determine it by the tables referred to, would result in failure. Many mistakes are made by not giving this fact due consideration.

If a mineral is *crystallized* and a perfect crystal selected for study, it is nearly certain to be a pure species.

Before commencing the study of a specimen, it will be well to examine it carefully with a good magnifying glass, the use of which will often reveal the composite character of what to the unassisted eye may seem to be homogeneous.

Take the following five common minerals to illustrate their more simple properties: galena, crystallized quartz, coal, common salt, red chalk.

Each of these minerals will be found to possess properties peculiar to itself, and by which it may with certainty be distinguished from the others, yet they will be seen to have other properties in common.

Galena

Has a metallic "lustre" which is not the case with the others; if reduced to a powder, each particle will be found to be cubical in shape.

This peculiarity will convey to the mind the idea of *cleavage*. If heated before the blowpipe it first decrepitates and then melts *(fusibility)* and gives off an *odor* of sulphur; if the heat is continued—especially if carbonate of soda is added—a bead of white metal appears *(reduction)* a portion of which volatilizes, coating the charcoal yellow *(incrustation)*. If the bead is hammered it will be found to be *malleable*, which distinguishes the mineral from certain others possessing metallic lustre and which in a like manner give white metallic beads before the blowpipe; galena will also be found to be so much heavier (specific gravity) than the other minerals as to attract attention also to that peculiarity. An examination of the

Quartz

Will show that it is harder than the others; that it is infusible alone before the blowpipe, but melts and forms a transparent bead when strongly heated with carbonate of soda on charcoal, or in a loop of platinum wire, and that a small fragment swims undissolved when similarly treated with microcosmic salt, retaining its perfect form. The undissolved silica is called the "silicious skeleton." If the

Coal

Is heated on platinum foil it burns away, leaving a small ash. This peculiarity distinguishes it from the other examples. When heated in a closed glass tube, it swells and gives off water, which may be shown to be acid; empyreumatic fumes escape from the open end of the tube combined with a gas which is inflammable.

Salt

Dissolves in water, which none of the others do. Its solubility gives it *taste*. Boiled with sulphuric acid, suffocating fumes of chlorine are given off. It generally but not always decrepitates when heated.

Red Chalk

Soils the hands, gives a deep red *streak* when rubbed on white paper or porcelain, adheres to the tongue and absorbs water. When heated before the blowpipe it becomes darker colored and is then attracted by the magnet, which was not the case before.

If these few minerals were the only ones found in nature, the science of mineralogy would be very simple. After investigation, neither could be taken for the other, but there are more than 600 species known to science, none of which are exactly alike; some resemble each other, but a careful study will reveal a difference in every case.

The true scientific determination of minerals is based on chemical analysis, but all the known species may be identified by a system of testing now in common use among mineralogists.

It is usual to make a series of experiments, which soon become quite familiar. By these simple tests some general idea of the specimen under examination is quickly obtained.

A systematic study of the specimen is then commenced, reference being made to a tabulated list of mineral species.

Dana gives the best table of this kind in his work on mineralogy, 4th edition, 1865. Chapman, Kohel, Mitchell, and others give similar ones, based however on the same general principles.

The specimen under examination is carefully inspected, and any peculiarity of appearance is noted. It is then successively tested for hardness, specific gravity, behavior in glass tubes, both open and closed; experiments are made to ascertain if it gives incrustation, or fumes when heated on charcoal. If it imparts color to borax bead in reducing or oxidizing flame; if it colors blowpipe flame; if a metallic bead can be reduced from it before the blowpipe; if so, is the metal red, yellow, or white; and is it malleable or brittle; when the bead is melted on charcoal, does it form a coating either white or colored? These are the preliminary tests alluded to before; notes must be made of the reactions on a convenient piece of paper.

Reference now being made to the tables, the systematic classification of the mineral commences.

Suppose the mineral to be devoid of taste, and to be insoluble in water. In this case it must be sought among the "Insoluble Minerals," which in the tabulated list are placed by themselves. Observe if its luster is metallic; if so, it would be useless to look for it in the *non-metallic* subdivision. It obviously belongs to the great subdivision of insoluble minerals having metallic luster.

Rub the specimen on a piece of roughened porcelain, or cut it with a knife; if the streak is metallic, it does not belong to the large class which do not give a metallic streak.

The streak being found to be metallic, an experiment is made to determine if the mineral is malleable; if so, the species can be readily identified, for this constitutes but a small group. If not, it is heated on charcoal to ascertain if it gives off fumes (a reference to the preliminary notes will give the result of this experiment). If fumes are evolved, a description of the species is sought in another group. If not, still another group must be consulted.

The above is the general method of determining minerals. The minute details can only be learned by much practice and careful study.

Commencement Day.—The Commencement exercises of the University at Oakland, will take place on Wednesday next, the 17th inst.

The re-union of the Associated Alumni of the Pacific Coast will follow immediately after the commencement exercises. This gathering will be represented as usual, by the talent, learning and refinement of the coast, and the proceedings will have an interest unsurpassed by that of any other re-union held in this State.

The University oration will be pronounced by Wm. A. Scott, D. D., and the poem by E. R. Still, M. A.

The Alumni oration and poem will be delivered at 3:30 P. M. The orator of the occasion is Colonel W. H. L. Barnes, A. M.; the poet, Thomas Newcomb, Esq. These exercises will be followed by a business meeting of the Association.

The usual evening festivities will begin at 5:30 P. M., at the hall on Sixth street. The Alumni and their wives, with invited guests, are entitled to seats at the table.

Coast and Interior Surface Geology.

Amos Bowman continued, (before the Academy of Sciences, partially reported last week) that the Pliocene sea lines so plainly marked on all the highest hills of the peninsula of San Francisco, are not wanting of obvious continuation into the interior.

Towards establishing their immediate relations with the Sacramento and San Joaquin valleys, Mr. Bowman drew the annexed diagram, being a view west from the highest hill of the Pleasanton Gravel Range in Livermore Valley, Alameda county. The importance of establishing as near as possible, from any and all sources, the exact altitude on the flanks of the Sierra Nevada, of the Pliocene sea into which flowed the ancient rivers of California's gold mining pride and greatness, need hardly be alluded to, for the relations of fluviatile forces and conditions to the existing sea, plainly constitute the elements, the *alpha* and *omega* of their dynamical history.

All the higher hills of Napa and Solano valleys hold forth abundant testimony of the character of those of Livermore valley and Pass, the geographical situation of which may make their testimony suffice. Their accessibility from the city too, with those on the San José R. R., will enable anyone to study and verify for himself the correctness of the following facts and conclusions.

The view from the summit of the Pleasanton Gravel Range in any direction of the compass, is rich in suggestive things, both scenially and geologically. Diablo looms up in noble grandeur to the north, enhanced in its sunny blue altitude by the level perspectives of the intervening valley, and a range of Pliocene hills. Evdivide to Suisun bay, the surplus or drainage waters of Livermore bay united their forces at Alameda cañon. That abrupt gorge has been cut since the Pliocene. It affords us a pretty good integer of the time involved in these recent changes, so interesting to us, by the 300 feet of erosion shown, at this proximity to the ocean and ocean level of the present.

The hand level applied by Mr. Bowman to the top of Alameda cañon and Dublin water shed from points between the two, proved the slight beginnings that determined the outlet in favor of Mission sag. The most simple of natural processes, illustrates in this case a popular paradox in geology: how rivers will sometimes flow directly across, over, or through a mountain range of the hardest rock, when they might have taken a level and easy road.

While on the peninsula of San Francisco these lines generally are shown by fossiliferous evidence to have a close relationship to the Pliocene, the evidence of the Pliocene age of those in the diagram is mainly their proximity to the former, and continuousness of levels. But at Big Slide, above alluded to, the whole of the Livermore Gravel Range is seen to rest conformably upon rocks containing plentifully, fossils of Miocene age. The top of the gravel range on which the observer of the sketch is supposed to stand, rises—be it understood—to the level of the dotted line, and the San Francisco Pliocene. *In nuce*: a Post Pliocene uplift of 900 feet, accompanied by departure of the sea, the latter giving grades of vantage for Post Pliocene erosion.

While on the ocean peninsula the Pliocene detrius is chiefly very hard rock; here, in Livermore Bay, it is mainly unconsolidated gravel at various altitudes, the consequent marks of system in the hills.

The gravels originated in the very long coast range longitudinal valleys of the Valle and Mocho creeks, coming into Livermore Valley from the S. and E.—one of them 60 miles long—where the older hills are largely composed, as Dr. Blake remarked, of easily disintegrated conglomerates.

On the San Joaquin side of the Livermore Pass, near Midway station to S. W., a similar terrace formation has been outlined on the maps of the Geological Survey, showing that the Pliocene Gulf levels rose at that point over the flattened hill tops of the R. R. summit at Altamont.

What relation had the sea to the gold mining gravels of Cal. ? is an important question on which the foregoing facts may throw some light. From Piety Hill gold mining district in Shasta Co., situated West of Sacramento river near the head of the valley, to Tulare Lake, the Pliocene Gulf received from the rivers everywhere along its margin, deposits of gravel, forming subaqueous shallows and washes. Marysville and Wheatland Knolls, and Poverty ridge at Sacramento, etc., are of this character. Remnants of considerable hills, or broad sloping plains along the footbills, of this age and character, have been traced and in a degree mapped. Why these deposits are mined for gold in some places, and not in others, is no great mystery. The distribution of the gold bearing slate formation as shown on the Geol. Survey map, tells the reason at a glance. The Klamath river mining basins and Gold Bluff gravels only extend this history to the North and West.

Prof. Davidson stated that at Pt. San Pedro there were sea terraces in the hills as high as 1,500 feet above the ocean; also that there are several sets of terraces at lower altitudes which can be traced by voyagers on the Southern coast steamers, and with great inctness, all the way from San Francisco to the Mexican boundary.

FIG. 3. VIEW WEST FROM PLEASANTON HILLS, LIVERMORE VALLEY (EMBRACING 16 MILES).

erything in the shape of hill, mountain and valley, groups itself into forms suggestive of relations to other hills, or terraced valleys. The long reeching subaqueous plains, now the straight topped highest hills, having been sliced up into several parallel ranges by the erosions, 500 ft. deep of the Valle and Mocho, give to the excursionist a spice of experiencing himself in a novel and peculiar situation. Oak knolls and oats are merely the season's clothing. Again and again he is reminded by glimpses of vast slides in the flanks of the gravel hills, that this is only another hydraulic mining country. Walls of broken gravel 400 feet perpendicular, like that so prominently in sight beyond the Arroyo Valle near Popes', a few miles east, overtop the tallest of the Sierra hydraulic banks. Go to it and he will wonder, in the silent solitude, what race of extinct Titans formerly existed and mined here, and ask himself what could they have been mining for, or deemed worth sluicing for other than gold?

The diagram shows a series of lines on the inside of the Alameda County hills, just opposite San Francisco bay and peninsula. The dotted line and first range of hills to the right of Sunol station, being in continuation of the terraced valleys of Llegunas to the south, and the remarkable flat topped summits stretching beyond Haywards pass to the north, present to the eye similar slight shovings and sagginge out of level (probably still in progress) to those observed in the section of San Francisco peninsula.

The change of level here since the Pliocene, in the ten miles from Mission sag to Decota hulge, must have been 100 feet, or as much as 10 feet to the mile, being perfectly regular. When the Mission sag had got so low at Alameda cañon as to form an outlet, more easily eroded, being shorter than the natural and longer one over Dublin plain and San Ramon and sand. The dotted line itself indicates the situation of washed beaches, and the highest of a series of porchlike bench formations, from the levels of which, in successive stages, Rohher's Cañon was eroded. These porches afforded the marauders from whose exploits the cañon derived its name, well known in connection with the history of Alameda county six or eight years ago, the most favorable points of outlook for pursuers, and easy escape over the summit, and down some of the converging cañons upon the opposite side of the Alameda range. One of these cahalleros being forced to take flight, struck to the eastward across the Pleasanton Gravel Range, and up the Arroyo Valle, as others of the gang had done before him, direct to the Big Slide, which is a natural fortress. The sheriff's pursuing party found this too strong and dangerous to attack, and between the labyrinth of towers and barrancas of the outlet the robber effected his escape.

Livermore valley was, in the Pliocence Tertiary, a part of the Gulf of California, which in outline and geologically, was a counterpart of San Francisco Bay. At its broad mouth were situated the islands of Tamalpais and Diablo, and other minor ones; and to north and south, the peninsular points of St. Helena and Mt. Lewis; and San Mateo Redwoods if the latter were not insular. The lines and physical features determining these facts are more definitely laid down in maps and papers in the office of the State Geological Survey.

The enormous Pleasanton and Livermore Gravel Ranges 500 to 600 feet in thickness are subaqueous deposits. In that they differ from the ancient river gravels of the Sierra Nevada, though they belong to the same period. Their bedding, scenic outlines and material, etc., establish these points. From the railroad in Livermore Valley anywhere, one may discern,

Chollar Potosi Mining Company.

The annual meeting of the Chollar Potosi Mining Company was held on the 8th inst., resulting in the re-election of the old officers. The Superintendent's report shows 37,789 tons of ore extracted during the year ending May 31st. The amount milled was 35,930 tons, averaging $26.17 per ton. During the previous year 84,681 tons were extracted, and in 1869-70 56,636 tons were taken out. The cost of extracting the ore during the past year was $2.38 per ton; reduction, including smelting and assaying $12.16; prospecting, repairs, dead work, etc. $4.19; total cost per ton $18.73; average yield $26.17; profit $7.44 per ton. The Secretary's report shows the following figures:

RECEIPTS.	
Proceeds of bullion sold	$940,120
Reclamation on mills	2,200
Sundries	2,254
Book accounts	390
Total receipts	$944,764
Cash on hand, per last statement	200,721
Total	$1,145,485
DISBURSEMENTS.	
Dividends to stockholders	$252,000
Working ores	431,179
Labor at mine	164,793
Timber and Lumber	44,480
State and Federal taxes	17,997
Hardware and Candles	10,826
Wood and Charcoal	4,907
Water account	6,600
Legal expenses	8,699
Freight expenses	3,970
General office expenses, etc	8,824
Miscellaneous	17,080
Total disbursements	$971,336
Cash at end of year	174,149
Total	$1,145,485

The company paid eight dividends during the year, seven of $1, and one of $2, or $9 per share, aggregating $252,000

Silk—Now for Information.

The people of the State have been for two or more years looking to the silk growers for information as to the nature of the industry of raising silk. And the silk growers have been looking to the California Silk Manufacturing Company to encourage their business, and to fix a paying price for their cocoons. The Silk Manufacturing Company have now been in operation for over a year, and have manufactured a large quantity of foreign and home-grown silk. Now we want some reliable information as to the value of the business for purposes of investment. This company will have its annual election meeting on the 5th of August next. Lets have some more light about the business. We want to know, not what this, that or the other one *thinks* can be made by feeding silkworms and producing cocoons; but what has this year or any other year been made in California at the business. And if there has not been a dollar made over cost of production, let us hear the truth of the matter.

And if the Silk Manufacturing Company can say just what they can pay for good California grown cocoons, let us know what it is.

EXTENSIVE MINING SALE.—The *Transcript* records a heavy sale of ditch and mining property in Placer county, by E. L. Bradley and M. S. Gardner to A. Chadbourne of this city for $375,000. The property summed up below is valuable and extensive, and is in the heart of a prosperous mining region.

The sale embraces the following property: One ditch from the North Fork of the American river, 30 miles long; three ditches from Cañon creek, one to supply the reservoir on "Hog's Back," one running to Gold Run and vicinity, one running to Dutch Flat and vicinity, connecting with reservoir at Alta; three ditches from little Bear river, one small ditch running to Elmore Hill, one to run water direct from Dutch Flat and vicinity, and one to run water to "Plug Ugly" hill, together with ten reservoirs and lakes. Also the following mining property in Dutch Flat Mining District: Yankee Co., 155 feet front by 434 feet back; New York and Wieconsin, 28 claims; Deep Shaft, 16 claims; Enterprise, 500 feet front by 600 deep; Boston, two-fifths of 20 claims; Iowe, one-fourth of 25 claims; Jehosopbat, one half of 36 claims; Waukeegan, 28 claims. Also the following in Gold Run District: Union, one-half of 600 by 900 feet; Schuylkill and Bailey, 25 claims; Gem, 385 by 1,200 feet; Gold Run, one-half of 60 claims; Gold Run Cañon, one-half of 150 by 2,000 feet; Druid, three-fifths of 16 claims; Ellison, 40 claims; Home Ticket, one-half of 26 claims; Rawley Cañon, 150 by 1,600 feet. Also the Sterrit claims, about 50 acres of mining ground in Lost Camp district. Also one section of timber land, being Section 36, Township 17 North, Range 12 East.

California Wines Endorsed.

At the banquet of the California Pioneers of Sacramento, on the 4th of July, I. N. Hoag introduced the following resolution, which was unanimously adopted:

"WHEREAS, The Committee of Arrangements have furnished for use on this occasion pure California wines, to the exclusion of all wines of a foreign brand or manufacture; and whereas, we have tried them and find them not only good but very good, therefore,

Resolved, That we, the California Pioneers of Sacramento and their friends present, unanimously indorse the action of the committee in this respect, and hope that hereafter all foreign wines will be excluded from the banquet tables of the California Pioneers throughout the State."

SMELTING.—The Phœnix furnace at Eureka, commenced smelting ore on the 9th inst. They have 1,000 tons of ore, 30,000 bushels of coal, and plenty of wood on hand.

Domestic Economy.

Are Tin Fruit Cans Injurious.

Much has been said of late with regard to the danger of metallic poisoning from eating fruit (especially very acid fruit) which has been put up in tin cans. A cotemporary says that tin hae long been justly regarded as one of the metals from the ordinary uses of which mankiud have notbing to fear. But the preseut age is characterized by ite factitious imitations. That which goes by the name of tin foil, is mostly an alloy of tin aud lead, and it is charged that many of the caps used for fruit jars, are made of zinc instead of tin. It is well known, also, that lead is used in soldering caus, aud that tbis metal ie attacked by certain orgauic acids which are contaiued in fruits. The tin of commerce is also by no mcans pure, and housekeepers will vouch that the tiu cans are often attacked by these acids, and eaten through so as to leak their fluid coutents. In the case of impuritiee in the tin used to coat tbe iron of the tin plates of commerce—when tbe caus are thus attacked, it may well be doubted whether the cumulated effects of metallic poisoniug do not sometimes result from this cause.

So far as the evideuce of the senses goes, housckeepers know that cooking tomatoes iu tin "ruins the basins" as oue good woman said; and another admitted that she commonly used up at least one basin iu a season for this purpose. How much injury tho partaker receives, wo do not kuow, but so much bas been said of the sad effects of metallic poisoning, eveu in small though long contiuued doses, that we would like to bo assured of safetv. Professor Youmans thinks it a small matter, but many medical authorities disagree with him. One of the latter says: "It ought to be known to housekeepers that acid, fatty, saline and even albuminous substauces, may occasiou colic, vomiting, etc., after having remained some time in tin vessels."

We see that the inner surface of the tin can is discolored after having been used for fruit, aud we find that the flavors of the more delicate fruits are injured when they have been kept in tin cans. Zinc is more readily oxidized than tin, and yet the caps of some of our glass caus are made of tbat metal.

If the amount of tin that may enter the system, as a result of its domestic use, is not likely to prove injurous, the questions are narrowed down to the purity of the article used, and the actual results of using the various cans prepared for our market.

Professor Edwards of the Woman's Medical College of the N. Y. Infirmary, said that the tin cane, *as prepared*, are very unsafe, that the acide dissolve the lead solder and sometimes oat through the entire plate, making the cans leak, and also that serious cases of poisoning had occurred from using their contents. If facts like these could be called out from scieutific meu, thcy would arrest public attentiou, and they might suggest to manufacturers of glass cans tbe desirability of protecting the inner surfaces of tbeir metallic caps in some way. Those with uetallic caps work so much more easily than others, that tbey will long he more or less iu demaud. Some people liue tbeir cape with stiff white paper—a small protection of course.

This snbject is of considerable importance in domestic economy of the household, and oue which should be more freely and fully discoursed by scienitfic men. Canned fruit has become a matter of almost daily use in many families, and if our familiee are eatiug a slow, metallic poison, the public ought to know it, and have the information conveyed by authority competent to judge and advise correctly.

Put Up Your Jam while Hot.—It is said that ordiuary jam—fruit and sugar which have been boiled together for eome time—keeps better if the pots into which it is poured are tied up while hot. If the paper can act as a strainer, in the eame way as cotton wool, it must be as people suppose. If one pot of Jam be allowed to cool before it is tied down, little germs will fall upou it from the air, and they will retain their vitality, because they fall upon a cool substance; they will he shut in by the paper, and will soon fall to work decomposing the fruit. If another pot, perfectly similar, be filled with a boiling hot mixture, and immediately covered over, though, of course, some of the ontside air must be shut in, any germe which are floating in it will be scalded, and in all probability destroyed, so that no decompositiou can take place.

Cooking Eggs.—Eggs broken in water are the "poached eggs" of the cook book, and a delicate way of preparing for table. Skill is however requisite to bring them unbroken on the platter. Butter your saucepan; then pour in boiliug water two inches iu depth; add a little salt; break the eggs carefully into a saucer, one at a tiue, and slip into the water; do uot crowd them; five or six at a time are snfficient for an ordinary pan. Keep the water just at boiling point. Wheu the whites are uicely set, and the yolks with a light covering that just reveal their richness, remove with a spoon to a platter, on which a few pieces of butter are laid. When all are taken up, a dash of pepper on each, and they aie ready for the table.

Okra or Gombo.

Did you ever eat okra or gombo—generally incorrectly spelled *ochra* or *gambo?* It is a West Indian plant, but almost universally used throughont the Southern States—and to some extent in the Middle Statee and in Cali fornia.

This plant belongs to tbe order of *malvaceæ*, the characteristic qualitiy of which is mncilaginoue. It is eaten green, like string-beans, the pod aud seed together. Tbe pod is about six iuches long, openiug iuto five longitudinal cells, filled with a great numher of seeds, which are sometimes roasted when ripe and used for coffee. Ite somewbat peculiar taste and excessively mucilaginous nature renders it rather distasteful at first; but an appetite for it is readily acquired. This vegetable is really more valuable for the table then generally supposed; but it must not be spoiled in the cooking.

Its nutritive qualities are quite remarkable, as it contains gum or gluten iu large quantities, which if properly administered to invalids and particularly that class suffering from consnmption in auy of its varied forms, is almost a "sheet anchor of hope," giving strength to the body, light to the eye, and color to the cheeks; which is priucipally accomplished by its easy digestion and assimilation.

In the South and throughout France, it is grown and nsed in large quautities, wbich would, if apart from other excesses, cause them to grow fat. In New Orleans and its vicinity as well as in that of Charleston, S. C., and wherever the French element has become mixed or blended with our native population it is sougbt for with an avidity truly astonishing.

The Northern people have "huckleberry feaste," catfish suppere," "clam bakes," etc., but they of the South have their okra or "gombo parties," where gombo forms a part and parcel of all the prepared dishes, beside those of it exclusively. Among the rest it ie cut fiue and cooked with stewed chicken which adds zest to the dish, to be relished by all the partakers. It is nsed freely when cut fine in vegetable soup, boiled and nsed with drawn butter, which latter dressing is improved by the addition of a small quantity of sherry or claret wine.

When used separately, by boiling, it is generally eaten whole or cut in two or three pieces; having been boiled from thirty minutes to an hour. When an appetite has been once acquired for it it becomes really a delicious dish. It is much used in vegetable soup with tomatoes, which may have added to it cabbage, potatoes, corn aud barley with a spriukle of parsley, summer savory, and a carrot or two, always using a piece of beef, which is preferred to a knuckle of veal as recommended by some.

It may also be boiled and dressed with butter, pepper and salt, with or without vinegar, or with drawn butter; or cut fine and cooked with stewed chicken, or in fact, any way or method which snggests itself.

Fresh Vegetables and Sweet Salads.

Those who value fresh vegetables and sweet salads will havo none washed in the garden. Neither the one nor the other should be washed nntil they are just ahout to be cooked or eaten. Even potatoes lose flavor quickly after being washed; so do carrots and turnips; while water will speedily become tainted in summer in contact with cauliflowere and cabbages, and thus destroy their freshness and flavor. The case is still worse with salads. If washed at all, it should be only before they are dressed, and they should be dried and dressed immediately. Nothing ruins tbe flavor of vegetables, and renders good salading uneatable, sooner than water hanging about them. If lettuces are quite cleau, they make the best salad unwashed; but if washed the operation should be done quickly, and the water instantly shaken out, and the leaves dried with a clean cloth. But, alas! how often are they cut and washed in the garden in the morning, and pitched into water into the scullery sink until wanted. What French *artiste* would be mad euough to rinse out his salad juice, and then recharge his lettuces and his eudivee with semi-putrid water?

The best practice is simply to remove all superfluous earth hy scraping or rubbing, and all rough tope or leaves by cutting. Enongh tender leaves may still be left on cauliflowers and brocoli to overlap the flowers. Salad should be sent in from the garden with most of the ontside leaves and main root on. The tender leaves are easily tainted and injured by exposure, and if the chief root is cut off sharp much of the juice oozes out at the wonnd. Where vegetables and salading have to he bought from a town greengrocer, the conditions are altogether different. Not only washing but soaking often becomes reqnisite to restore something like pristine crispness.

Use White Cheese.—The fact has been developed by a chemist at Cornell University, that every specimen of the so-called "best basket annatto," collected from eome of the finest cheese factories in Herkimer county, aud submitted for analysis by the Little Falls Farmere' Club, contained a large percentage of mineral or inorganic matter. Nearly every sample contained copper; aud tracee of arsenic, it was thought, were discovered in at least one. The presence of these poisons is certainly not calculated to render cheese "a healthy and nutritions article of food," and we are glad to learn, as we do from Mr. X. A. Willard, dairy editor of the *Rural New Yorker*, that the demand for white or uncolored cheese seems to be steadily increasing. Our authority statee that some of tbe Herkimer "fancy factories" have beeu making this kind all the season; that the sales have been at the highest rates, and he expresses the opinion that if it were not for the London trade and the requirements of certain English markets, there would be no difficnlty in banisbing all coloring material from the vats. So far as home consumption of chesse is concerued, our people would soon learn to prefer the uncolored article, aud the facts above developed in regard to aunatto may help to hasten tbie desirable consummation.

The Poetry of the Table.

In the first place, a starched and smoothly-ironed table-cloth—which, if neatly folded after every meal, will look well for several days. Then flowers and ferns in flat dishes, baskets, or small vases,—or else a tiny nosegay laid upon every napkin.

The salt must be pure aud emooth. The butter should be moulded iuto criss-crossed diamoud, shells, or globes, with the paddles made for this purpose.

A few pretty dishes will make the plainest table glow;—a small bright-colored platter for pickles, horse-radish, or jelly; aud butter-plates representing green leaves are also attractive.

A few pennies' worth of parsley or cress, mingled with small scraps of white paper daiutly clipped, will cause a plain dish to assume the air of a Freuce *entree*. A platter of hash may be ornamented with an edging of toasted or fried bred cut into points; and a dish of mutton chops ie much more impressive with the bones stacked as soldiers stack their guns, forming a pyramid in the center—each bone adorned with a frill of cnt paper. A few slices of lemon, miugled with sprigs of parsley and slices of hard-boiled eggs, form a pretty garnish to many dishes; and uothing could be more appetizing than beef, veal, muttou, or lamb made iuto mince-meat, and pressed into form in a wine-glass, then fried in pork fat, with a sprig of green placed in the top of each little cone. The basket of fruit—peaches, pears, grapes or apples, oranges aud grapes—should be tastefully arranged and trimmed with leaves and flowers. The bowl of salid shonld be ornameuted with the scarlet and orange flowers of the tropæolum, — their piquant flavor adding zest to tbe lettuce, with which they can be eateu.

Selected Receipts.

Boiled Indian Pudding.—Take sweet milk of sufficient quantity for the pudding desired; salt to the taste, and stir in Indian meal till a little milk will rise on the top by standing. If too thick it will be hard. Fill a pudding crock, and tie a cloth tightly over it. Put into boiling water sufficient to keep it covered, and boil steadily for threo hours. Fruit may be added if desired. Serve with sweetened cream. This is an old-fashioned Connecticut pudding.

Cornmeal Punning.—Two qnarts of sweet milk, one pint of cornmeal, one-half pint of beef suet or fat pork, chopped fiue, three eggs, aud a little nutmeg and salt; sweeten to your taste with sugar. Heat the milk, and while hot, stir iu the meal; after this, set it where it will cool, and then add the eggs. Bake from three to four hours in a slow oven.

Indian Meal Pudning.—Into one quart of boiling milk stir one quart of eifted fine meal; then add one quart of cold milk, two well beaten egge, one-half cup of sugar, one cup of flour, and a little salt and spice. Stir it well and pour it into a buttered dish. Bake two hours, and serve with butter.

Rice Waffles.—Oue cup of boiled rice, oue of flour, one quart of milk, one teaspoonful of butter, four eggs, a teaspoou half full of salt. Beat the white of the eggs to a stiff froth, and mix the whole very evenly. Bake in waffle-irons and butter before eaten.

Potato Cakes.—Take one dozen large potatoes, fresh boiled and mashed very fine, ¼ lb. butter, three eggs beaten, and ¼ lb. of flour, mix together with a fork (do not handle it), roll into thin cakes, and bake quickly in a hot oven.

Lemon Pie With Three Crusts.—A layer of crust, a layer of lemon, sliced fine, a little sugar, a layer of crust again, and sugar and lemon again, then the upper crust, makes a good lemon pie.

Another Way.—One cup of sngar, one cup of sweet milk, one egg, one and a half lemon, the grated peel and juice, one tablespoonful of flour; theu, after baking, the white of an egg beateu, sweetened and pnt on the top, then put in the oven and browned.

To Color Slate Color.—Boil yellow oak bark in an iron kettle till the etrength is extracted. Take out the bark, then add a very little copperas, aud you have a pretty color with no expense.

To Extract Ink from Floors.—Ink spots on floors cau be removed hy scouring them with sand wet iu oil of vitriol aud water mixed. Rinse them, wheu the ink is extracted, with strong pearl-ash water.

Brandy in Boiling Meat.—If as soon as meat is skimmed and thoroughly boiliug, two spoonfuls of brandy is added to every three pounds of meat, the meat will become tender, though it may have been very tough, and will not retain any taste of the brandy.

LEA & PERRINS'

CELEBRATED

Worcestershire Sauce.

Declared by Connoisseurs to be tbe only good Sauce.

Caution Against Fraud.

Tbe success of tbis most delicious and unrivalled Condiment having caused certain dealers to apply tbe name of "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure tbe genuine is to ASK FOR LEA & PERRINS' SAUCE, and see tbat their names are upon tbe wrapper, labels, stopper and bottle.

Some of the foreign markets baving been supplied with a spurious Worcestersbire sauce, upon the wrapper and labels of wbich tbe names of Lea and Perrins have been forged, L. and P. give notice that tbey bave furnisbed tbeir correspondents witb power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by wbich their right may be infringed.

Ask for LEA & PERRINS' Sauce, and see name on wrapper, label, bottle and stopper

Wholesale and for export by tbe Proprietors, Worcester; Crosse & Blackwell, London, &c., &c., and by Grocere aud Oilmen universally. 15v24-eow-tf

SHEET IRON PIPE.

THE

Risdon Iron and Locomotive Works

Corner Howard and Beale Streets,

Are prepared to make SHEET IRON AND ASPHALTUM PIPE, of any size and for any pressure, and contract to lay the same where wanted, guaranteeing a perfect working pipe with tbe least amount of material.

Standard sizes of railroad Car Wheels, with special patterns for Mining Cars. These small wheels are made of the best Car Wheel Iron, properly cbilled, and can be fitted up with tbe improved axle and box—introduced by tbis company, and guaranteed to outlast any otber wheels made in this State.

BURLEIGH
ROCK DRILLS
AND
AIR COMPRESSORS.
The Burleigh Rock Drills, which have stood the test of five years constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequalled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunnelling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground, or compressed air when under ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being applied.
Send for illustrated pamphlet to

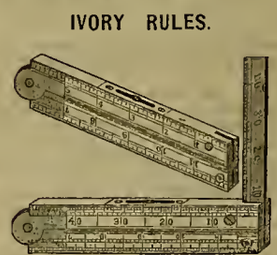
Repeating Sporting Rifles—Oiled Stocks.
Repeating Sporting Rifles—Varnished Stocks.
Gold, Silver and Nickle-plated Rifles—beautifully Engraved.
Repeating Carbines—Oiled Stocks.
Repeating Carbines—Gold, Silver and Nickel-Plated and Engraved.
Muskets—Angular or Sword Bayonets.
Full stock constantly on hand of all the different parts of the Winchester Arms.
Cartridges in cases (Rrand H), manufactured by th W. R. A. Co. expressly for their arms.
A full and complete stock of the above named merchandise always on hand and for sale by
JOHN SKINKER, Sole Agent,
5v21-6m-lamr 108 Battery street, S. F.

The California Powder Works
No. 314 CALIFORNIA STREET,
SAN FRANCISCO.
Manufacturers and have constantly on hand
SPORTING,
MINING,
And BLASTING
POWDER,
Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.
We have been awarded successively
Three Gold Medals
By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.
We also call attention to our
HERCULES POWDER,
Which combines all the force of other strong explosives now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other pompound now in use.
A circular containing a full description of this Powder can be obtained on application to our Office.
16v20-3m JOHN F. LOHSE, Secretary.

STEPHENS & CO.,
MANUFACTURERS OF
U. S. STANDARD BOXWOOD AND IVORY RULES.


ALSO EXCLUSIVE MANUFACTURERS OF
L. C. Stephens' Patent Combination Rule.
This cut represents the COMBINATION RULE, which comprises a Foot Rule, Spirit Level, Try Square, Bevel, Plumb, Slope Level, Etc.
It is made of the very best quality of Turkey Boxwood, heavily bound with brass, and is graduated with mathematical accuracy.
The Square is adjustable, and can be tested and made perfectly true by the aid of a small screw-driver, but this is seldom required.
In its application as a Slope Level it is especially adapted for Miners' use, as it shows the PITCH TO THE FOOT, and DEGREE OF INCLINATION at once. It is six inches long when folded, by one and three-eighths wide, and three-eighths inches thick, the cut being just one-fourth size.
"By the use of one of these, a builder, mason, carpenter, or other workmen, can always have in his pocket the most valuable of his apparatus used in construction, combined in a portable, useful and cheap form."—*Scientific American.*
Price by mail, prepaid, $4. For agents' terms, address
STEPHENS & CO.,
18v24-3m Riverton, Conn.

$1,000 REWARD! For any case of Blind, Bleeding, Itching, or Ulcerated Piles that Dr Bing's Pile Remedy fails to cure. It is prepared expressly to cure the Piles and nothing else. Sold by all Druggists. Price $1.00.
C. F. RICHARDS & Co., Agents, corner Clay and Sansome streets, San Francisco, Cal.

PATENTS & INVENTIONS.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports to DEWEY & CO., U. S. and Foreign Patent Agents, and Publishers of the Mining and Scientific Press.]

FOR THE WEEK ENDING JUNE 25TH.

MACHINE FOR SAWING STAVES.—Otto Osten, Tahoe City, Cal.

COVER FOR PEPPER-BOXES.—Henry E. Thomas, San Francisco, Cal.

CARBURETER.—Augustus F. H. Braun, S. F.

MONEY-DRAWER.—Henry Unna, San Francisco.

ICE-MACHINE.—David Boyle, San Francisco, Cal., assignor to himself and JOHN W. PEARSON, same place.

TRADE-MARK.

BEVERAGE.—Asher S. Taylor, San Francisco.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency

The Text of Interesting Decisions in Patent Cases.

COMMISSIONER'S DECISION.

ELI W. BLAKE, Extension.—[In the matter of the application of Eli Whitney Blake for the extension of Letters Patent for IMPROVEMENT IN STONE-CRUSHING MACHINES, granted June 15, 1858, and re-issued January 9, 1866.—Decided June 14, 1872.]

THE REGARD TO BE PAID BY THE OFFICE TO THE DECISIONS OF UNITED STATES COURTS—CONSTRUCTION OF CLAIMS.

The United States courts and the Supreme court of the United States having—after examination of the merits of the case and the discussion of the references relied on for opposing the extension of the Blake patent on the ground of its lack of novelty—concurred in vindicating the novelty of the said invention and the claims of the re-issue, the Commissioner of patents considers that matter disposed of, and refusee to call in question the actiou of the judges.

The construction given to a patent by the courts determines its legal character and defines its meaning.

Where a patentee has obtaiued two patents in the same line of inveution, the former containing in the rough the main principles of the machine, while the latter embraces the relatively-perfected devicee which give it working value, the Office, on applicatiou for extenciou, will have special regard to the intrinsic value of the earlier patent as the pioneer, especially when the original and the improved form are the invention of the same party.

LEGGETT, *Commissioner*.

In the origiual application the inveutiou secured by this patent is described as follows:

"My stone-breaker, so far as respects its principle or its essential characteristics, conеists of a pair of jaws, one fixed and the other movable, between which the stonee are to be broken, having their acting faces nearly in an upright position, and convergent downward, one toward the other, in euch manner that while the space between them at the top is such as to receive the stones that are to be broken, that at the bottom ie only sufficient to allow the fragments to pass when broken to the required size, and giving to the movable jaw a short and powerful vibration through a small space, say one-fourth of an inch, more or less."

January 9, 1866, the applicant obtaiued a reissue of said patent, and with the following claims:

"1. The combination, in a stone-breaking machine, of the upright convergent jaws with a revolving shaft, aud mechanism for imparting a dcfinite reciprocating movement to one of the jaws from the revolving shaft, the whole being and operating substantially as sct forth.

"2. The combination, in a stone-breaking machine, of the upright movable jaw with the revolving shaft and fly-wheel, the whole being and operating substantially as set forth.

"3 In combination with the upright converging jaws and the revolving shaft, imparting a dcfinitely limited vibration to the movable jaw, so arranging the jaws that they can be set at different distances from each other at the bottom so as to produce fragments of any desired size."

It would seem that the question of uovelty in this case need occupy but a moment's attention, as the patent has been several times before the courts and the claims fully sustained; yet the remonstrants protest in able argument that Blake's invention, as claimed, was fully anticipated, and the examiner, in his report, says:

"Touching the question of novelty, while it is not denied that a patent might have been properly granted, based npon a limited claim to the construction and combination of parts exhibited in the machine in question, attention is respectfully called to the following named cases herewith submitted, which would appear to the present examiner to substantially anticipate whatever of invention is embraced in said re-issue claims: James Hamilton, patented January 3, 1854; James Hamilton, patented May 22, 1855; Townsend Poore, patented May 12, 1857; Frederick Ohnmachts, filed August 24, 1857, and rejected."

In the case of *Blake vs. Stafford*, tried in the United States Circuit Court, district of Connecticut, September term, 1867, Judge Shipman, by the aid of learned council for aud against, makes an able and exhauetive examination of this whole matter, and after a full and careful diecusciou of each one of the referencee now cited by the examiner fully vindicates the novelty of Blake's invention and sustains the claims of the re-issue. On a motion for new trial the case wae taken to the United States Snpreme Court, and Justice Nelson reviewe and fully sustains the decision of Judge Shipman. The patent was also before Judge Drummond, in the northern district of Illinoie, Jnly term, 1871, in the case of *Blake vs. Eagle Manufacturing Company*, where the same references were urged and ably discussed and the patent snstained. Thus the patent has been three timee before the courts, and three of our most able judges have agreed in deciding that the referencеs cited by the examiner do not anticipate the applicant's inveutiou as set forth in the claims of his re-issue; and for the Commissioner to hold that these learned judges have all erred in their decisious would be an exhibition of unpardonable pedantry, notwithstanding the adverse opinion of the able examiner; hence I shall take for granted, without further discussion, that the novelty of the invention in question is satisfactorily estabhiehed.

The learned council for the remonstrants insist, however, that if the patent is extended the applicant shall be required to limit himself by disclaimer to the "jointed toggle" arrangement described in hie original applicatiou; but even this question was discussed before Jndge Drummond, who gave the invention and claim a scope sufficiently broad to cover a "rod and lever" connection, the very device the remonstrants desire to have disclaimed. If Blake is entitled to anything, it is his invention as construed by the courts, and the Office would not be justified in requiring him to limit himeelf to a narrower claim thau the courts have allowed him. I may further add that this patent, with snbstantially the same claim, has been in the Englisb courts, where it was sustained, and on this point Vice-Chancellor Wood held substantially the same as Judge Drummond.

The remonstrants also make the point that Blake's stone-crusher as described in this patent was a failure, aud that but very few of them were ever made; that the machine that has proved successful is the one constructed under his patent of 1860, and hence the 1858 patent should not be extended. It is probably true that but few machines have been constructed under this pateut, and, though having great iutrinsic value, yet, as compared with the Blake machine of 1860, it was a failure. Blake discovered the defects in the machiue of 1858 himself, and remedied those defects iu the machine which he patented iu 1860. The latter machine was only an improvement ou the former, aud embraced substautially all the elements of the former. The machine of 1858 is the basis upou which the one of 1860 is built. When the invention of 1858 becomes pnblic property the patent of 1860 becomes of little value. It has beeu the uniform practice of the Office to favor pioneer iuventions, eveu where the improvements have been made by others, and the reasoue for the practice are donbly strong where the original inventor has improved his own machine. This same objection was urged in the Lipman pencil-tip extensiou case, and was discussed in the decision of that case, publish-ed in the *Official Gazette* of April 2, 1872, to which reference is made.

It is admitted that the invention ie one of great importance and the value far beyond all that the inventor has received from it, and the proof shows that he has used dne diligence in creating and supplying the demand for it. I see no reason for believing that the extension would be detrimental to the public. The extension will be grauted.

A GILROY INVENTION.—J. S. Woolsey of this city has invented and reduced to practical perfection a portable heating machine that cannot fail in occupying a prominent place among the many useful inventions of the day. It is particularly useful in the manufacture of cheese, and also for cooking and laundry purposes, and is entirely safe from explosion. The machine is 32 inches long and 17 in diameter, contains 11 flues of 1¼ inches each in diameter, with a fire box 18 inches long and 10 inches in diameter. The safety valve is so ingeniously and yet so simply arranged that explosion is impossible. It requires but little fuel and will warm water to a boiling heat in five minutes. Every farmer, laundry and dairyman should immediately procure one. Mr. Woolsey has made application [through the MINING AND SCIENTIFIC PRESS Agency] for a patent. It may be seen at his shop on Monterey street in this city.—*Gilroy Advocate.*

A NEW BOOK ON MINING.

The Explorers', Miners' and Metallurgists' Companion: Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy. The Most Practical and Comprehensive Work on Mining Subjects Extant. Comprising 640 Pages, and 81 Engravings. By J. S. Phillips, M. E. Price, bound in cloth, $10 (in coin); in leather, $12. Forwarded by mail, in cloth, $11.40, currency; in leather, $13.75. Issued and for sale by DEWEY & Co., Patent Agents and Publishers Mining and Scientific Press, S. F.

If you want pictures or fine frames, cheap, send to Sanborn, Vail & Co., 31 Kearny street, S. F. 18v24-3m

S. F. Stock and Exchange Board.

THURSDAY, JULY 11, 1872.

The sales at the Board for the week ending July 3d, amounted to $1,306,000. The largest transactions were in Imperal. The sum of $80,000 was shipped from the Pioche mine on 6th inst. The Raymond & Ely mine, from the 1st to the 5th inst., shipped $67,100; the Kentuck has shipped so far this month $8,870. The Sierra Nevada mine produced last week 300 tons of ore; and the Chollar Potosi 900 tons, aseaying $42 per ton; the Hale & Norcoss turned out 420 tons, the Savage 1,065 tons, assaying $21.98 per ton; the North Star mine produced 83 tone aud reduced 60 tons. The Buckeye ore reduced during the month of June, yielded $4,658.

The high grade ore iu the 1,000-foot level of the Belcher mine ie looking better than was expected. The developments in the Pioche are excelleut; assays from the vein development in the Imperial vary from $100 to $450 per tou.

The following dividends are announced this week: Pioche, $1; Belcher, $30; Crown Point, $3; Raymond and Ely, $7. Assessments have been levied as follows: St. Lonis, $1; Phœnix, $1; Pacific Borax, 15 cents; Senator, 25 cente; Daney, 75 cents; Empire Mill and Mining Co., 50 cents.

The latter part of this week stocks have been quite lively. The Board adjourned over from the 4th of July nntil Monday, the 8th inst., when business was resumed. Pioche and Raymond and Ely showed a marked advance on that day; Pioche selling at $37, and Raymond and Ely $147. Compared with the sales on the 3d inst., Savage advanced $10, Alpha, $9, Pioche, $12, Raymond and Ely, $7, Exchequer, $4, Ophir, $3; Segregated Belcher and Hale and Norcross, each $2. Gould and Curry declined $4.

On Tuesday the market continued active, and prices were still higher for nearly all descriptions. Alpha advanced $4 from previous morning's sales. Chollar Potosi $2, Caledonia $3, Baltimore, Hale & Norcross and Ophir, each $1. Exchequer $7.50, Meadow Valley $1.50, Overman $2.50, Pioche $3, Savage $3.50, Segregated Belcher $2.50 and Yellow Jacket $7.50; Gould & Curry declined $2.50.

On Wednesday stocks dropped a little, Belcher advancing $20, Kentuck $15, and Consolidated Virginia $2.50, while Alpha declined $17, Exchequer $7, Yellow Jacket $5, Segregated Belcher $4.50, Caledonia and Chollar Potosi $3, Imperial $2, Hale & Norcross each $1.

To-day a reaction ensned, and Ophir advanced $15, Caledonia $5, Chollar Potosi $2, Confidence $3.50, Consolidated Virginia $1, Crown Point $2, Exchequer $5, Gould & Curry $7, Segregated Belcher $4, and Yellow Jacket $5; Hale & Norcross declined $1, Overman $4, Savage $2.50 and Ophir $1.

The last reports concerning the progress of work and the latest developments in all the prominent mines on the coast, will be found in our "MINING SUMMARY."

San Francisco Metal Market.

MARAVILLA COCOA.—No breakfast table is complete without this delicious heverage. The *Globe* says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supercedes every other Cocoa in the market. Entire solubility, delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homeopaths and invalids we could not recommend a more agreeable or valuable heverage." Sold in packets only by all grocers, to whom also may he had Taylor Brothers' Original Homeopathic Cocoa and Soluble Chocolate Steam Mills —Brick Lane, London. Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the M. & S. Press, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Corona Consolidated Mining Company—

Location of works, Eureka District, Lander County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 25th day of June, 1872, an assessment of Ten Cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, No. 409 California street, up stairs, San Francisco, California. Any stock upon which said assessment shall remain unpaid on the 31st day of July, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the 22d day of August, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. F. CRONISE, Secretary.

Office, 409 California street, San Francisco, California. Jun29-3t

Eagle Quicksilver Mining Company---Location of mines, Eagle Mining District, Santa Barbara County, California.

NOTICE.—There are delinquent upon the shares of the following named persons, on account of assessment levied on the 8th day of May, 1872, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Bush, A T	Unissued.	1	$40 00
Benton, S T	Unissued.	1	40 00
Benton, Benj	Unissued.	1	40 00
Brinkerhoff, S B	Unissued.	2	80 00
Church, Thos. R	Unissued.	1	40 00
Crane, A. M	Unissued.	1	40 00
Fernald, Chas	Unissued.	1	40 00
Kyle, J. J	Unissued.	2	80 00
Ploche, F. L. A	Unissued.	2	80 00
Richards, Janet T.,	Unissued.	1	40 00

And in accordance with law, and the articles of agreement of said Company, and an order of the Board of Trustees thereof, made on the 8th day of May, 1872, the whole or such undivided part of each delinquent share in said mines, as may be necessary to pay said assessment upon each, will be sold to the highest bidder, at public auction, for cash, in United States gold coin, at the office of the Company, Room 5, No. 302 Montgomery street, San Francisco, California, on Monday, the 15th day of July, 1872, at the hour of 2 o'clock, P. M., of said day, to pay the said delinquent assessment thereon, together with costs of advertising and expenses of sale.

WM. H. WATSON, Secretary.

Office, Room 5, No. 302 Montgomery street, San Francisco, California.

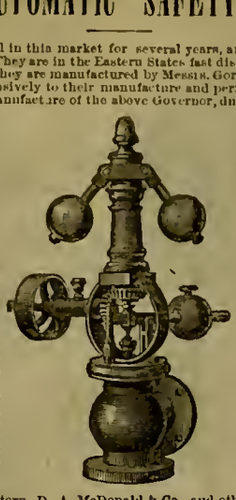
jyl3-2w ALFRED K. DURBROW, Secretary.

THE GARDNER AUTOMATIC SAFETY-STOP GOVERNOR.



These Governors have now been sold in this market for several years, and wherever once introduced and made known, are invariably sought after. They are in the Eastern States fast displacing all other Steam Governors, and are regarded as *the perfect regulator*. They are manufactured by Messrs. Gorchar & Robertson, practical engineers, who have given many years time exclusively to their manufacture and perfection. The manufacturers say: After an experience of eleven years in the manufacture of the above Governor, during which time several important improvements have been made and two additional patents obtained, we feel justified in recommending it to all parties using Steam power, and warranting it to be the most perfect regulator in the market.

The Gardner Governor is so well known that we think it unnecessary to enforiate a detailed explanation of the principles involved, or details in its construction, merely giving the leading objects realized by this important invention. The Governor combines with the greatest simplicity of construction, accurate regulation of speed, POSITIVE INSURANCE AGAINST ALL ACCIDENTS LIABLE TO OCCUR FROM SLIPPING OR PARTING THE GOVERNOR OR DRIVING BELTS, and a convenient arrangement FOR ADJUSTING THE SPEED OF THE ENGINE WHILE IN MOTION, without change of pullies.

The construction of the Governor is extremely simple, having no springs, lusible joints, swivels, or parts liable to disarrangement, all the several parts are duplicates of each other in the same series; the most skillful workmen are employed, the best material used and the machinery employed especially adapted to their manufacture. The valve is most PERFECTLY BALANCED, and the Governor is built with a view of securing the quickest and most sensitive action possibly attainable in a steam regulator. Thus with accurate machinery, and skilled labor, and devoting our WHOLE ATTENTION to the manufacture of THIS ONE ARTICLE, we are able to produce a perfect and reliable Governor at a low price.

We do not publish any letters of recommendations, but can give references to upwards of 5,000 PARTIES THROUGHOUT THE UNITED STATES, who are using the Gardner Governor.

We would especially invite the attention of Steam Engine Builders to this Governor, feeling assured that they can purchase for less than they can make an inferior article, and thereby increase the value and sales of their Engines.

We respectfully refer to the following parties using the GARDNER GOVERNOR, and can speak understandingly of its merits: Oakland Cotton Mills, the Selby Lead and Silver Smelting Works, L. & E. Emanuel, Vulcan Iron Works, Fulton Foundry, Levison Bros., Cal. Jewelry Co., Pioneer Woolen Factory, D. A. McDonald & Co., and others in San Francisco; Ophir Co, Lady Bryan, and Sacramento and Meredith Mills, John McCone, Virginia, Nev.; Globe Iron Works, Stockton; A. F. Chury, Albany, Oregon, and many others.

☞ WE WARRANT these Governors to give perfect regulation of speed under all circumstances; and if there is one within one thousand miles of San Francisco, that is not giving perfect satisfaction, it may be returned to us at our expense, and we will exchange it for any other Governor in the country, or refund its price.

☞ When ordering please state whether THROTTLE-VALVE is wanted or not; and whether BLOCK or FINISHED Governor is desired. ***THE RATE OF SPEED FOR GOVERNOR IS FULLY STAMPED ON THE REVOLVING HEAD OF EVERY GOVERNOR. Send for circular and price list to

TREADWELL & CO.,

Agents for Pacific States, San Francisco.

☞ At Treadwell & Co.'s (late BERRY & PLACE'S) Machinery and Supply Depot may be found in stock the above Governors, together with all sizes of HOADLEY'S PORTABLE ENGINES, BLAKE'S STEAM PUMPS, STURTEVANT BLOWERS, PORTABLE DRILLS, TAPS AND DIES, DREYFUS'S CYLINDER LUBRICATORS, Etc. Also a heavy stock of HARDWARE AND MINING TOOLS, LEATHER BELTING, LINEN HOSE, BOILER FELT (saves 25 per cent. of fuel), SELF OILERS, LACE LEATHER, STEAM PACKING (all kinds), BELT STUDS, Etc., Etc., embracing every description of Engineers' and Machinists' supplies and Millmen's findings. 7v24-tf

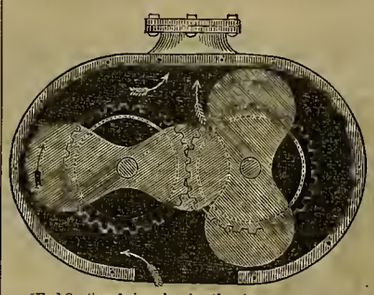
MANUFACTURED AT THE

GLOBE IRON WORKS,

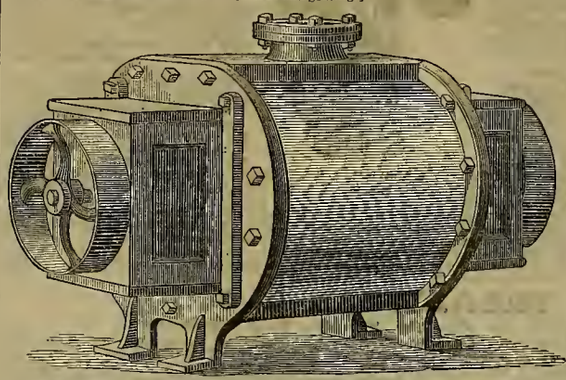
Stockton, Cal.



[End Sectional view showing the pistons and gearing.]

Awarded the First Premium at the Paris Exposition.—Patented November 1, 1864; July 24, 1866; and October 9, 1866.

Adapted for Smelting, Foundry, Mining and Steamships. Requires 50 Per Cent. less power than any Blower now in use.



One of these Blowers may be seen at W. T. Garratt & Co.'s Brass Foundry, San Francisco; Gould & Curry and Savage S. M. Co.'s, Nevada; and at C. P. R. R. Co.'s Works, Sacramento; and other places on this coast.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article. Quartz, Saw and Grist Mill, Iron, Stationary and Steamboat Engines, Horse-Power and Pumps, of all Sizes.

Machinery.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco.

A Blake's Crusher

FOR SALE CHEAP.

One of Blake's Patent Ore Crushers, size 8x10, second-hand and in perfect order, is offered for sale cheap. Also,

A STEAM ENGINE,

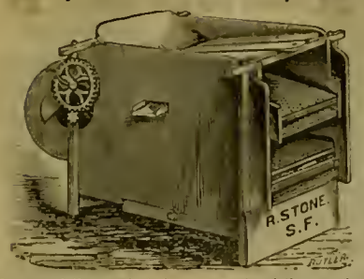
THE PATENT
Novelty Mill and Grain Separator



Is one of the greatest improvements of the age for cleaning and separating Grain, while it combines all the essential qualities of a first-class Fanning Mill. It also far excels anything that has been invented for the separation of Grain. It has been thoroughly tested on all the different kinds of mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.

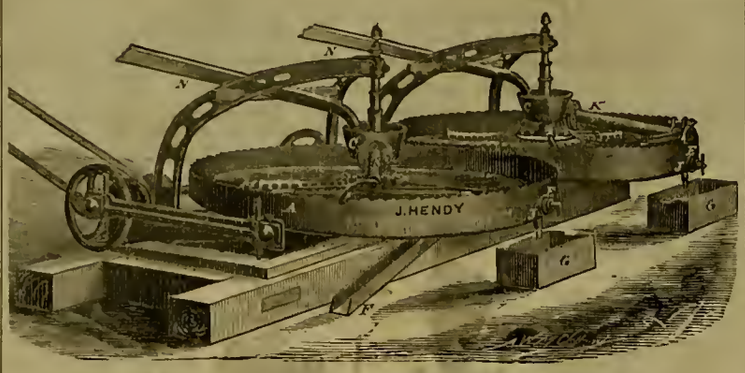
HENDY'S
LATEST IMPROVED PATENT SELF-DISCHARGING SULPHURETS CONCENTRATOR.



Can be seen at the Manufactory, 32 Fremont Street, San Francisco.

Those in want of Concentrators would do well to visit some of the quartz mills that have Hendy's Patent Concentrators in use, and satisfy themselves before purchasing other Concentrators of pretended merit. THEY ARE WARRANTED TO WORK SATISFACTORILY.

The principle upon which HENDY'S PATENT CONCENTRATOR is constructed is the only true and mechanical one for the purpose of concentration.

Centrifugal Force and Gravitation,

Combined as they are in this Machine, CANNOT FAIL TO ACCOMPLISH the object sought.

Many certificates from proprietors of mills, who have this Concentrator in use, can be had if required, giving the most flattering accounts of its efficiency.

A most substantial evidence of its worth is the fact that its proprietor is receiving repeated orders from those who are using them, and who have tested their merits.

The proprietor has still further improved the machine, making it stronger and still more durable. He flatters himself that the added advantages leave nothing further to be desired as the perfection of the machine.

References:

Reference is made to the following mills, some of which have had HENDY'S CONCENTRATORS in use for over four years.

EMPIRE MILL. (8 Concentrators)	Grass Valley, Nevada County.
NORTH STAR M. & M. CO. (8 Concentrators)	Grass Valley, Nevada County.
VULTURE CO. (8 Concentrators)	Prescott, Arizona.
NOYE'S & CO'S MILL. (2 Concentrators)	Prescott, Arizona.

Are now manufacturing besides the famous regular

GIANT POWDER, A NO. 2 GIANT POWDER,

Somewhat slower in its Explosion, which we recommend for

BANK BLASTING, COAL MINES,

AND FOR ALL SUCH WORK WHERE THE ROCK IS NOT VERY HARD

It is fully as safe as the other and evolves neither smoke nor noxious fumes when exploded.

Price. 50 Cents per Pound.

The sales of both grades increase very fast, which is the best proof of their superiority over other explosives.

BANDMANN, NIELSEN & CO.,
20v22-3m16p General Agents, No. 210 Front Street.

BLAKE'S PATENT STEAM PUMP.

These Pumps have been tested, and found to be indisputably without an equal wherever tried. They have been sold in the Pacific States now for upwards of 4 years, and we are willing every one in use may be referred to; every Pump will speak for itself. They are constructed in the most simple style, and built in the most thorough manner—especially calculated for simplicity, durability and power. Some of the advantages of the Blake Pump may be summed up as follows: It is positive under any pressure. May be run slow or fast, as may be desired. Will discharge more water than any others of the same dimensions. Has no leaky joints, the steam part being cast in one entire piece. The steam valve is perfectly balanced, is cushioned at each end, and glides with the greatest facility, having no cams nor complex Rotary Arrangements to get out of order. Will start at any point of the stroke, and will discharge all the water of condensation. The Pump has no crank or fly-wheel, thereby saving a considerable item of expense to the purchaser. Having no dead points, it therefore needs no watching, and is consequently ready to start without using a starting bar or any hand-work whatever. The Blake Pump is extensively used on Railroads and Steamboats; in Hotels; for Mining and Fire purposes; in Breweries, Tanneries, Sugar Houses, Factories, Mills, Laundries, and as Boiler Feeders, wherever steam is employed. In fact, wherever water or other liquids are desired to be raised in large or small quantities, or against heavy or light pressure, it is the cheapest and best Pump that can be used. It is offered to the public as the most perfect independent steam Pump ever invented. Forty different sizes are made, capable of throwing from 1,000 to 200,000 gallons an hour, and adapted to any class of work that may be required. Every Pump will be warranted to perform the work required of it by the purchaser, or it may be returned, and the money will be cheerfully refunded. The Blake Pump was awarded a Silver Medal at the Exhibition of Mechanics' Institute, San Francisco, and State Fair at Sacramento, as being the best Steam Pump on Exhibition. The agents have recently imported several of the largest-sized Mining Pumps for water works and deep mines, and will be pleased to refer parties to them; we claim for it, that it is the most simple and durable, and consequently the best Steam Pump ever built. For sale by TREADWELL & CO., Machinery Depot, old stand, Market, head of Front Street, San Francisco, who will be pleased to send circulars to any address, or show its advantages to parties calling on them.

2v25-2w CYRUS W. CARMANY, Cashier.

PURCHASERS please say advertised in SCIENTIFIC PRESS.

To Engineers and Millmen.

NATHAN & DREYFUS'
PATENT
Self-Acting Lubricators for Cylinders.

Their advantages over other lubricators are so striking, that it is only a question of time for them to come into general use—their accuracy in keeping the valves and pistons thoroughly and constantly lubricated being unequalled. A close examination of this sectional view of Lubricating Cup will give an idea of its working.

The principle of working is based on an intermittent condensation of steam in the UPPER PART of the cup containing the lubricant. At every couple of strokes, the steam condensing, produces a drop of water, which, being heavier than the oil, sinks by its own gravity, and raises a corresponding drop of oil over into a tube, which arises in the center of the cup and conveys said oil directly to the chest and cylinder, this tube being the only connection from the Lubricator to the internal part of the engine. The water produced by the condensation is drawn off once a day by a side-cock, and the cup filled again with the lubricant. Another advantage is, that the condensing process refines the oil, as the water settling down thro' lubricant carries down salts and acids which may be contained therein. In this way corrosion of the steam chest and cylinder is prevented, the power of the engine improved, and an amount of packing saved. These Lubricators have been adopted on THOUSANDS of stationary and marine engines, steam pumps, steam fire engines, and locomotives by over EIGHTY RAILROADS in the United States.

☞ Send for a Circular and Sample, for which no charge unless approved of.
Address **TREADWELL & CO.,**
San Francisco.

DREYFUS' PATENT SELF-OILERS,
For Shafting, Engines, Machines, Etc.

Save from 75 to 95 per cent. of oil used on shafting or machinery hearings. No better investment for the amount can be made by any person having machinery or running shafting. They are widely known for their reliability and economy. All the trouble of "oiling up" is avoided. There is no waste of oil, and no cans are needed. A single trial will prove their value. We will put them into any mill, and if not perfectly satisfactory, they may be returned at our expense, and the price will be refunded. We have a large stock on hand, of all sizes, adapted to all description of boxes. Send for Price List and Circular.

SAN FRANCISCO, SATURDAY, JULY 20, 1872.

VOLUME XXV. Number 3.

Sketch of the Geology of Upper Burmah—the Khan States to Western China.

[Written for the PRESS by W. Brodemeyer, D. M.]

Geology of the Coal Districts.

The region between the Irrawaddy and the Kjendnen (the latter a branch of the Irrawaddy, rising near Patkoidown and flowing in a southeasterly direction to Yandabo, eight geographical miles below Mandalay, the residence of the King of Burmah) is very productive. All the mountain chains are cut into by streams, forming valleys and basins which are crossed by smaller water courses. The mountain range of Mnngwije, forms a trianglo with corners at Mnngwije, Bhammo and Matsein. At Matsein there occnrs first in a small valley a bed of bituminons coal *(Lettenkohle)*. From this point coal beds extend past Kaboct, Tingedoe, Tamboo to Kotoun, eight geographical miles abovo Mandalay on the banks of the Irrawaddy. The formation here is primary, the rock belonging to the transition period. The exposed rocks are limestones, often with abrupt brakes, sandstones, clay slates and stone coals. At Kotonn the coal beds are covered to a depth of 29 to 30 feet by calcareons slate, swinestone (or stinkstone or bituminons lime), marl, loam and earth, and are enclosed between clay-slate and sandstone. The bed has a dip of 30 degrees, and is 5 to 6 feet thick, bnt often broken up by intercolated clays so that the coal itself is only 3 feet thick. The coal is anthracite and contains 94.5 per cent. carbon, 4.2 oxygen, 0.8 water and 0.5 ash.

From Kotoun to Mandalay, on the right bank of the Irrawaddy, the sandstone appears in gently nndulating mounds. The bed of a small brook between the Irrawaddy and the Kjnduen was filled with grains of calcite of the size of pess, these arising from weathered oolite. The rock declivities below Mandalay consist of mnssels and coralline conglomerate, cemented by calcareons marl, and are therefore a kind of Tertiary (Molasse). The rocks extend to the coast of Aracan. In various localities near the coast there are qualitative differences. In general the cementing material consists of lime, magnesia, clay with a mixture of iron oxid and a little manganese. In these rocks I found numerons examples of Tritonium, Hippopus, Turritella, Turbo, Arva Diluviana, Conus, and Fungia.

The conglomerate in the Nagay mountains, half way between the coast of Aracan and the Irrawaddy, reminds one of the sub-appenine formations. This rock is mixed with limestone in the neighborhood of the Irrawaddy and with chalk rocks near Amjen, which attain a hight of about 400 feet. The deposit is horizontal, covers the mountain sides and ravines and fills the crevices between the Jura limestones which break through it here and there.

The limestone is coarsely granular with many veins and geodes of calcite. Often streaks and fragments of alabaster are found. The limestone becomes more homogeneous with increasing depth, and contains much silica. In the siliceous limestone there occurs chalcedony of brownish and yellowish red color, with quartz geodes and red siliceous limestone. The quartz crystals occur in transparent twin forms. The limeetone ie rich in fossils, as *Madrepora*, *Meandrina*, *Cyathophyllum* and *Turbinolia*. Of muscels I found *Belemnites* and *Hippopus*, all changed into calcite, whereby the examples distinguished themeelves directly as petrifactione of the Tertiary (molasse) period. The thickness of this lime deposit was twenty-three feet. The formation here described hears a strong resemblance to the white Jura of Germany.

Going upwards from Mandaly ,twenty-eight geographical miles to Malun, and downwards about ten miles along the right bank of the Irrawaddy to Maley, one finds first in the plain of Malun the sandy ground covered with innnmerable lime rocks. (Here are *Belemnites*, and we therefore have the white Jura.) Here one comes to a mountain where occur oolitic rocks, consisting of white grains lying in a blue and grayish-black marl traversed by veins of calcite. Under this rock I found a grayish-black clay deposit. On the other side of the mountain under the oolitic rock occurs calcareous marl traversed by calcite veins. The rock contains silicate of iron. Under the marl occurs again the grayish-black clay shale.

Iron Deposils.

All aronnd in the mountains are rich mines of brown irou stone (limonite) worked by the Burmese in a most irregular manner. They used fires for disintegrating the rock, and the power of powder for this purpose created great astonishment among them. The rock contains lime, magnesia, silica, alumina, oxide of iron and manganese. In one of the mines the limouite ore traversed the oolite in a layer three feet thick. Under the oolito was a greenish-whito sandstone alternating with marl. Both rocks contained fossils. I found among the petrifactions *Terebratula*, *Cimbria lacunosa*, *Varians*, *Vulgaris*, *Nuoleata*, *Apiocrinus cochiniatus rotundus*. Next follows a bituminous marl shale—calcareous shale. In the river itself I found many *crustaceæ;* next came the yellow Lias sandstone with slaty structure, containing indistinct impressions.

The Burmese work only the best iron ores. Blast furnaces are unknown to them and I conld obtain no material or money for them. The Burmese give only what is absolutely required and demand immediate returns for their investments.

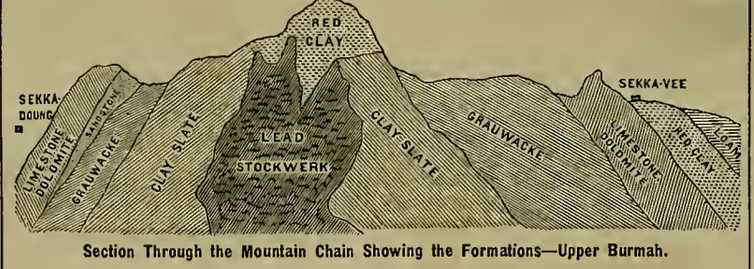
After this formation the Keuper appears. The rock consists of breccia-like siliceous sandstone and lies above a reddish clay slate. Opposite Mandalay the Keuper marl appears everywhere, alternating by green sandstone, lime and alabaster of a beautiful milk-white color; the last in the marl. The sandstone becomes argillaceous below, has a gray color and contains much mica. Tho same sandstone alternates, three miles below Kotoun, with thin beds of coal, which last, finally, ¼ mile from the Irrawaddy, occnr with a thickness of 5 feet.

Copper, Lead, Silver amd other Deposits.

The black clay contains considerable copper as a coating, and much of this metal occurs in the calcareous eandstone. Here in a region 15 geographical miles long and 7 miles wide, are many copper minee. In depth occur malachite and copper sulphurets. I worked among others, a mine which contained in a sandstone with red spots, large grains of azurite and malachite. The azurite occurred in crystals and the malachite in kidney-shaped masses. I found by analysis 73 per cent. copper. The veins dip to the southeast. The mineral-bearing rock has a width of 2½ feet, alternating with red clay. Several beds run parallel. In other mines, as Nama-dodjie (name of the Chief Queen) the malachite occurs with a reddish brown clayey rock.

In the Khan States, where I staid bnt a short time, the formation was in general about the same, but the mountain chains are high (2,000 to 7,000 feet,) the roads very poor and the land populated by elephants and tigers. Here are very rich copper mines. I found here native copper in a white clay; also diorite and copper, malachite and plate-like crystals of copper glance. Much richer were the lead and silver mines.

The whole mountain chain which extends form the left bank of the Irrawaddy, eight geographical miles above Mandalay, towards the Khan States in a northwesterly direction, and throngh these to western China, belongs to the primitive formation, and more particularly to the Ancient sedimentary group. It is composed of mica slate, and bluish gray clay slate, associated with talcose slate, to which are joined sandstone and grauwacke. The rock contains quartz, copper, lead, silver, quicksilver, platinum, gold and iron of almost every kind. The lead and silver mines of Sekka-doung and Sekka-vee are situated in a valley enclosed by mountains. The deposits are covered by a layer of red clay, 23 feet thick. Many minerals are associated with quartz. The bordering rock is bluish gray clay slate and grauwacke. The deposits appear to occur in stockwerks, and reach nearly to the surface; they have a strike from northeast to southwest at an angle of 75 degrees.



Section Through the Mountain Chain Showing the Formations—Upper Burmah.

The majority of the lead and silver mines are situated in the Khan States, viz.: Moung-la, Kijan-hnng, Mu ang-lee, Tjengkan. The lead ores contain 65 to 72 per cent. lead, the fahl ores 4 per cent. silver, and the silver ore 70 to 83 per cent. silver. The Burmese and Khans obtain, however, by smelting, only about 50 per cent. of the metal, for their furnaces are very incomplete. It was not possible for me to get better furnaces. In the attempt to do so I met with invincible obstinacy. I often proposed to the King to build better furnaces in order to re-work the slags; the invariahle reply was, "wait." The deepest Burmese mines were only 116–150 feet down, and the work was of the most irregular description. I wondered at the narrow, low galleries which were driven at an angle of 40 degrees. I never found any shafts, and had much trouble in accnetoming the Burmese to vertical einkings. The Khans are much better miners than the Burmese.

Precious Stones.

In Mogaun, on the Endon (a small branch of the Irrawaddy,) 12 geographical miles from Bhaumo, are the lsrgest ruby miues of upper Burmah, and, pcrhaps, of the world. They occur in a chain of 27 hills. The conntry rock is limestone, over 200 feet thick and covered with red clay. The limestone is everywhere fractured and the crevices filled with sands, clay, quartz fragments and weathered calcite. Out of these the rubies are obtained by washing, which is done by women. I used for the purpose round vessels of sheet iron, 18 inches in diameter, with edges 3 inches high, pierced with numberless holes like a sieve. I found principally rubies and sapphires; also emeralds, topsz, zicon, and spinelle. The dark clay holds more sapphires, the light, yellowish clay, more rubies. The amount of precious stones here is exceedingly large. Tho work is easy. The crevices are opened from the snrface and followed. The narrower ones, formerly neglected, I widened by blasting. At a depth of 150 feet, I was mnch troubled by the water. The King promised to order pumps and machinery, but took no further action, although the ruhies aud other gems increased in size and value with the depth.

Sixteen English miles from Mandalay and 2 miles from the left bank of the Irrawaddy, above Ava and Medea, are small ruby mines, situated in a chain of 16 hills. They comprise an area 6 English miles long and 1¼ wide. Formation, occurence and method of working are the same as at Mogaun. The Burmese told me that to the north the rubies were broken out of the granite and sandstone, bnt I did not visit the locality, it being too distant and I uot having the time.

Miners—Government Officers.

The Burmese miners are of two classes: soldiers and peasants (slaves). Properly speaking, every one ie a slave in Burmah; the King having power of life or death. Every family is responsible for the behavior of the members. But the soldiers have greater privileges. The priest constitute the highest caste.

The men in the mines receive $4.80, the women $2.88, and the children $1.92 (gold) per month. To each two men there is an underforeman who receives $7.20, and to each four under-foreman an overseer who receives $10.80 to $14.20; over these are officers and the district governors, of whom 24 are paid mostly by tithes. The King has four ministers;—Pakamendji, Minister of State; Lausi-mendji, of the interior, Yinanjong-mendi, of war; Kampamendji, of commerce. Under these are 12 Woon-dooks.

Precious Metals and Gems.

The sand of most of the streams, especially near Ava, carries much gold. One sees daily thousands of gold-washers. The view of the Bhuddist temples covered with gold attest the richness of the land in the precious metal.

Burmah is rich in minerals of every kind, particularly copper, iron, lead, silver, gold. amber, jasper, rubies, sapphires and platinum, Diamonds only have not yet been found. Most of the jasper comes from Mogaun and is a highly prized article among the Chinese who come in large caravans for the purpose of barter.

EMMA MINE DISPUTE.—A dispatch dated, Salt Lake, July 16th, says that "in Chambers on that day, Chief Justice McKean setting ae Chancellor, in an elaborate opinion, granted an injunction in favor of the Emma mine against the Illinois Tunnel Company." The decision is generally well received.

BRAZIL supplies two-thirds of all the coffee consumed throughout the world.

CORRESPONDENCE.

Notes of Travel in Lander and Elko Counties, Nevada.

[By our Traveling Correspondent.]

Palisade

Is on the line of the Central Pacific Railroad, in Lander county, Nevada, of which Austin is the the county seat. It is eitnated on the Humboldt River, at a point where Pine Creek empties into it. The place is 573 miles from Sau Francisco, and contains ebout 200 inhebitants, and one good hotel (the Palisade). The town derives its importance from being the point the traveler takes stege for neerly all the importent mines in the State (outside the Comstock lode). The first mining camp of importance attracting our attention, is Mineral Hill, 36 miles south of Palisade. To get there the traveler leaves San Francieco at 7 A. M., and arrives, *via.* the C. P. R. R., at Palisade the next day at 2.23 P. M.—fare $38. Here you lay over one hour and then take

Woodruff and Ennor's

Fine six-horse coaches—fare $8. We were honored by "California Sampeon" having charge of the reins on our paseage to Mineral Hill, and were whirled over the road—36 miles—in four hours and thirty minutes, including twenty minutes stoppage for changing our eix horses four times. Considering that we hed a full load of passengere and freight, the roads quite dusty, and an up grade, I do not believe the time has ever been beaten in your State, They certainly have the finest average lot of horsee on thie line I ever eaw. The line runs daily to Hamilton, a distence of 125 miles.

A Beautiful Valley.

Leaving Palisade by the above ronte, the traveler follows up "Pine Creek," a fine stream of water rnnning the year round, through a valley bearing the eame name. This valley is about 40 milee in length, and from 2 to 10 miles in width, and the finest grazing section on the Pacific Coast. Cattle live well here the year round. Where irrigation is brought into requisition, vegetables and grain yield abundantly.

Sights En-Route.

The atmosphere is quite light here, owing to the great altitude, and not eo clear as in California, except at early morning, or late in the afternoon. Our accomodating driver pointed out the principle houee in Mineral Hill, 21 miles—before we arrived there.

The crickets, a great plague in this section, are about three inches long, and eo thick on the ground at times, as to cover the stage wheele with their mangled bodies as we passed along. Four miles before reaching Mineral Hill, and a little to the westward of our road is three or four hot springs, known as the

White Sulphur Springs.

It is said that the waters of these springs are a certain cure for all rheumatic complaints, nervous debility and diseases contracted from the fumes of smelting furnaces, as well es diseasee of the lunge. I am told that the place is neatly furnished and that many permanent cures of lead poisoning and rheumatism have been effected. The springs are kept by John L. Davenport, and the cherges are $20 per week, iucluding baths, etc.

Mineral Hill.

This place, containing about 300 inbabitants, and situated 6,100 feet above the sea level, is Elko county, Nev. On the 17th of June last it was almostentirely consnmed by fire, the mills, however, and one store was saved. As little or no insurance was taken here, its inhabitants have been greatly impoverished, but undaunted by loeses they are again building, believing as they do, that their mines have a sufficient supply of silver to again make them whole. First among their mines are the

Mineral Hill Silver Mines Co., (Limited.)

The registered office of the company is in England; capital $1,500,000, in 30,000 shares of $50 each. Debenture mortgage 3,000; debentures of $500 each bearing fifteen per cent per annum. The company own 41 mines, claims, ledgee or sites, sitnated at Mineral Hill, in the State of Nevada. They incorporated in April, 1871, since which time they have extracted and ehipped upwards of $680,000 worth of silver bullion. The mines of this Co. are located at an elevation of 400 ft. above the town and are being worked, at present, with a force of 65 men. This company is running two tunnele, one 500 and the other 600 feet long, and working night and day shifts. One of theee tunnels rune across the hill and one parellel with the same. Three shafte are eunk on this company'e works; one on the Giant ie down 123 ft. perpendicnlar, with a one-horse-power hoisting works (called a whip). They have drifted 145 ft. from bottom of that shaft. On the "Troy" a shaft is down 100 ft., at an angle of 45°. On the Star a shaft is down 55 ft. on an angle of 40°.

The managers are Messrs. John Taylor Sons, No. 6 Queen street Place, London. Agents in Nevada: H. H. Oake, Superintendent; F. Haskins, Mining Agent; M. Eissler, Metallurgist. They own two mille, situated in close proximity to each other, half mile below the mine; one is oalled the "Taylor" (with twenty stamps) the and other the "Atwood," (with fifteen stamps,) both run by steam; they have a combined capacity of cruehing 31 tons per day—of 24 hours. Working 40 men regularly. The

"Spencer Silver Mine"

Ie on Mineral Hill, and a little to the eastward of the mine above mentioned. This mine consists of 800 feet, owned by 4 men, one of whom, Amos Plummer, is euperintendent. Their developments consist of a shaft 45 feet deep, from which they have extracted about 150 tons of milling ore; 100 tons of which worked at the Mineral Hill Co's. mines mill, peid $117 per ton. Better ore than any that hae been cruehed, is now being extracted. Working 7 men regnlarly.

The Austin Silver Mine

Consiste of an original location of 1,000 feet, sitnated on the snmmit of Mineral Hill next adjoining the above on the south. This location ie owned by 5 persons. J. C. Crombie ie Superintendent; their developements coneist of a shaft 45 feet deep from the croppinge. They have rnn eeveral drifts and cute, whioh have given them great confidence in their claim; 1,000 tons have been worked from this mine that averaged them $225 per ton, running from $78 to $1,565 per ton; 250 tons of choice ore ie now on hand.

They have 250 tone of cboice ore on hand bnt are not now working for want of a mill to crneh their ore. From Eureka in my next.

L. P. MO.

The "Alpine Miner" and "Metallurgist."

In its issue of Jnne 29th the Alpine *Miner* throws itself manfully into the breach in defense of the managers of the Terebish Mill, whom it aesnmes (probably correctly) were referred to in an article pnbliehed in the SCIENTIFIO PREES on the 22d nltimo, and signed "Metallurgist." The writer in the Alpine *Miner* is pleased to take exception to the compleints of inventore, that their inventions fail to fnlfill that which they claim for them, because of the ignorance of thoee who have the cherge of their working. Certainly these gentlemen have a right to insist upon the necessity of proper manipnlation in the testing of their epparatus.

"Metallnrgist" stated that when the inventor was present to enperintend its operation, the White Furnace chloridized 78¼ per cent. of the assay valne, and in every other respect fulfilled what was claimed for it.

The Alpine *Miner* denies this in toto, having seen "the papers" which make a very different exhibit of the results obtained under the inventor's supervision. It is thus redneed to a mere question of veracity between "Metallurgist" and the Alpine *Miner*, or the writer of "the papers" which settle the matter so satisfactorily to the author of the article in that jonrnal.

Not having eeen "tbe papere," which are so conclusive, I am willing to take the Alpine *Miner's* report of them.

They allege only 47½ per cent. of chloridizment instead of 78¼—a notable difference truly. The statement, however, of "Metallurgist," was made after an assay of the ore operated upon had been made in San Francisco by an established and thoroughly qualified assayer, and is therefore much more reliable than a haphazard result obtained by any of *soi-disant* assayers so frequently found fluctnating from point to point in mining dietricts, and continually misleading bard-working proepectors.

It would be a gratifying ae well as an amusing experiment to divide a sample of ore, between one of these itinerant metallurgical oracles and an estabiished assayer of known accuracy, and eubsequently compare their certificates.

It is very possible that the whole of the Alpine *Miner's* information is based on equally queetionable anthority, ae for instance the evidence of the mill officials who failed to obtain satiefactory results from the working of the furnace, and who naturally enough wonld throw the bleme on anything and everybody rather than on their own shoulders.

With regard to what tbe Alpine *Miner* says, as to a man's early occupation not incapacitating him for any other, that is about the only sensible thing contained in the article. But euch a change in a man's avocation must not be sudden, euch as "Metallnrgist" relates, when the bootmaker or grocer assumed the cbarge of a mill before he had ever seen one in operation.

Benjamin Franklin wae, as we all know, a printer, but by study he became a very great deal more. Mr. White may or may not have been a printer, or a shoemaker, thet matters not; but years of investigation and experiment must have preceded the invention of his furnace, otherwise he conld no more have designed and invented that which is based on scientific principles, a pre-knowledge of which was an absolute neceesity, than a tinemith could drop the tools of a trede be nnderstood, and at once assume eatisfectorily the role of surveyor, aesayer and mining expert. There have been a good many of these rapid transitions in this country, and they have been productive of the greatest injnry to onr mining intereets.

The Alpine *Miner* mistakes entirely wben he assumes that Mr. White and "Metallurgiet" are identical. Neither is the writer of this Mr. White, whom he has only occasionally met by chance, and that some time ago. He is eimply,

A FRIEND TO FAIR PLAY.

Mines in Amador County.

At no period in the history of quartz mining in thie county hae the prospect been more cheerful than at present, and if no serious drawbacks ehould happen to our developed minee to retard their daily operations, the gold yield for the preeent year will be far in advance of ite predeceesors. We have in Amador connty a nnmber of well developed paying mines furnishing employment to a large nnmber of men, in the variove indnetriee created by them, and theee rioh minee simply prove that there are numerone ledges unprospected in the county, that by well directed labor and ekill would eoon be made to yield equal to the best.

The mines at Sutter Creek are looking remerkably well, and new improvements and machinery are being added to nearly all of them in the vicinity. The deetrnction of the boieting worke of the Amador, was, and for sometime to come will continue to be a calamity to the connty, bnt should the nnderground works remain intact, work will eoon be commenced, and the varions industries created by the working of the mine will be resumed, and all tracee of the lete disaeter will disappear in the future returns from their rich deposits in the depths below, reqniring years to exhaust.

At Amador, the Keystone holde its own bravely, yielding its tribnte of $40,000 to $50,000 per month, affording employment to hundreds of persons, and adding largely to the businese and permanent wealth of the county. The original Amador, near the Keystone, will eoon set its 40 ponderous stamps in motion likewise affording employment to a large number of men and creating various indnetriee that will aid in the general thrift.

At Drytown, the main shaft on the Gover ie being rapidly eunk, and ae we learn, with flattering prospecte of a permanent paying ledge. Other ledges in the vicinity are being prospected which if pereevered in will result in snccee.

At the new town of Plymouth the Phœnix miue, nnder the snperintendence of Mr. W. H. Hooper, is being developed into the most valuable mine in the county, if not in the State. At the present depth of the main ehaft, 500 feet, the ledge has attained the width of twenty feet withont defining its fnll extent, and the whole of the ledge ranging from ten to one hnndrod dollars per ton. A 40-stamp mill in connection with the mine is now being erected with the most approved appliances for eaving gold and sulphurets. The rich developments of the Phœnix will canse other ledges in the vicinity to be vigoronsly prospected, and it is reasonable to expect other valnable discoveries will be made.

The Alpine, a continuation of the Phœnix on the north at a depth of 300 feet is turning out excellent rock, end givee every assurance that it ie a valuable mine. North of thePlymonth and within the eeme belt is the Condo, Enterprise, Richmond, and a nnmber of other partially prospected ledgee, whiob when properly developed, may, and some of them will, prove to be mines of great valne.

Near Jackson, the Kennedy is fast assuming ite position among the most valuable mines in the county, the average yield of the last crushing reached twenty-fonr dollars per ton, and the rock increases in value end quantity as greater depths are gained. This mine affords employment to a large number of hands in the various departments connected with it. The Oneida, north of the Kennedy, likewise employs a large force end is one of the permanent and valuable mines of the connty. East of Jackson near the foot of the Butte, is the State of Meine mine, and as far as the ledge has been snnk upon gives evidence of permanent valne. A fine water power mill connected with the mine is fast approaching completion, and eoon we hope to chronicle satisfactory returns from its batteries.

The Marklee mine, situeted north of Volcano, from what we can learn of its operations, ie doing better from the number of stamps employed than perhaps any mine in the county. The Marklee establishee the fact that rich gold-bearing ledges exist in the county outside of the Amador belt, and that capital may safely be invested in the nnmerous nndeveloped ledgee in the belt wherein the Marklee is situated. Work we understand is being prosecnted on a number of ledges east of Volcano, but with what enccess we have not been poeted.

We bave been informed that work has been resumed upon the Newton Copper mine eituated on the tnrnpike leading from Jackson to Ione City. The value of the ore from this mine hae been well eetabliehed, and if copper ehould ever reach former pricee, and Amador county blest with easy and cheap transportation, the Newton copper mine would be the most valneble property in the county, indeed it is only a question of time when it will be eo proven.

In addition to our quertz resources, we bave a large area of nnworked placer ground, which will afford profitable employment to hnndreds of men as soon ae water can be had. The great want of the connty is water; but this want will ere long be snpplied, for the Sutter Canal will be completed and whether by the present owners or other parties matters not, so that it be completed. And when that event ehall take place, a new impetus will be given to every industrial pnrsuit in the county besides opening np new branches of labor and bueiness adding largely to the population and weelth of the county.—*Amador Ledger.*

RIOH STRIKE.—A dispatch dated Salt Lake City, Jnly 11th, etetes that the greateet body of mineral ever diecovered has recently been located by two men from Illinois, named McHenry and Hughes, in the Wasatch Range, about seven milee south of Kimball'e Hotel, Parley'e Park, and twenty-five miles from Echo, on the Central Pecific Railroad. The ledge crops ont seventy feet, with an average width of thirty feet. Numerous aseays showa yield in silver of from $250 to $1,100 per ton, of perfectly free milling ore. Visitors to it estimate the rock in sight to be over 20,000 tons, valued at over $5,000,000. Old mining experts and prospectore are greatly excited.

BLATOHLEY'S DRILLS.—We are in daily expectation of information from Dr. Blatchley, the inventor of the new machine drill for mining, that his machines will be placed on sale here at an early day. It is probable that Prof. J. Alden Smith will be appointed the agent for thie section, and have the honor of introducing it here. It will be followed by a complete revolution in the present system of mining, which will be greatly to the advantage of all concerned.—*Colorado Register.*

ANOTHER DARIEN EXPEDITION.—The Navy Department will send out another Darien ship canal expedition next Novemher or December, nnder command of Commodore Selfridge, who expects to find a still shorter route than the one he discovered last year. The Department has $8,000 at its command for thie purpose.

SCIENTIFIC PROGRESS.

The Nature of Comets.

We condense the following from the review of Zöllner's work on the nature of comets in the June *Am. Jour. Science*. This volume contains some contributions to the theory of comets, which are so novel and remarkable as to merit more than a passing notice, and a brief abstract of the more prominent points of the discussion is given.

Starting from the well known fact that water, mercury and many other substances, even in the solid state, give off vapor of a certain amount, though of very low tension, and inferring from the characteristic odors of metals that they too, even at very low temperatures, are constantly giving off vapor, it follows that a mass of matter in space will ultimately surround itself with its own vapor, and the tension of the latter will depend upon the mass of the body, that is, upon its gravitative energy, and the temperature. If the mass of the body is so small that its attractive force is insufficient to give to the enveloping vapor its maximum tension for the existing temperature, the evolution of vapor will be continuous until the whole mass is converted into it.

The discussion leads to the result that, in empty and unlimited space, a finite mass of gas is in a condition of unstable equilibrium, and must become dissipated by continual expansion and consequent decrease of density. A necessary consequence of this result is that the celestial spaces, at least within the limits of the stellar universe, must be filled with matter in the form of gas, pre-eminently that of the terrestial atmosphere.

The author then proceeds to discuss the density of atmospheric air upon the surfaces of the celestial bodies and in space. Assuming for the purposes of calculation, and in accordance with the above mentioned considerations, that the space occupied by the stellar system is everywhere filled with atmospheric air, and taking the temperature as that of melting ice, he finds the lower limit of density so small that there could be no appreciable effect either upon the rays of light or upon the motion of bodies in space. The limit becomes still less in value if the temperature is taken at 60° C., with Fourier, or at 142° C. with Pouillet.

Any solid body in space must, by virtue of its gravitative energy, condense the gas to form an atmosphere upon its surface, and the density of this gaseous envelope can readily be calculated when the size and mass of the body are known. For the moon the value is found to be a vanishing quantity, and are completely in accord with the fact that no trace of a lunar atmosphere has ever been detected. For the larger plants, on the other hand, the value becomes very great, so great that the high density of their atmospheres must occasion perceptible effects, by absorption, upon the light reflected from them, and the result lends a new interest to the peculiar spectra of Uranus and Neptune, as well as of Jupiter, which appear to exhibit lines resulting from atmospheric influence.

If a fluid mass, a meteoroid for instance, should exist at a distance from the sun or any body capable of radiating heat to it, its temperature would be that of the surrounding space, and, if its mass were not too great, a slow evaporation would gradually convert it into a sphere of vapor. Should the fluid mass, however, approach the sun, the solar heat would cause it to evaporize much more rapidly, the smaller the mass, the more rapid the evaporation. The smaller comets, which have often the appearance of spherical masses of vapor, are examples of bodies of such a nature. Prof. Zöllner thinks there is no improbability of the existence of such fluid masses in space, consisting of water or of liquid hydro-carbons, and the spectra of some of the nebulae and smaller comets confirm the idea very strongly.

The peculiarities already mentioned are readily explained by reference to the general properties of fluid substances. The comets offer others which are the result of their causes, namely, their *Self-Luminosity* and the formation of a *train*, with a special relation of the latter, in its position and direction to the sun.

As to the former, only two causes are known through which a vaporous or gaseous mass can become self-luminous;—elevation of temperature, as by combustion; and electrical excitement. The first the author rejects as unsufficient and unsatisfactory, assuming the second. Granting that electricity may be developed by the action of solar heat, as it can be produced by similar processes within the limits of our experience, we have a cause sufficient to account for both the self-luminosity of comets and their train-formation. The spectrum of the vaporous envelope of a comet thus illuminated must necessarily be that produced by the passage of an electrical discharge through vapor identical in substance with a portion at least of the cometic nucleus, from which the envelope is derived; that is, water and liquid hydry-carbons. Thne the resemblance and partial coincidonce of the observed cometic spectra with those of gaseous hydro-carbone ia explained.

Tho form and direction of the train indicate the action of a repulsive force. After citing the confirmatory opinions of Olbers and Halley on this point, Prof. Zöllner asserte that the assumption of an electrical action of the sun upon the bodies of the solar system is necessary and sufficient to account for all the essential and characteristic phenomena of tho vaporous envelopo and ths train.

When a body is at the same time undor the influencs of both the gravitative and the electrical forces, with an incroase of mass there results a prepondcraunce of gravitation over electricity, with a sufficient decrease in the mass the contrary. Hence the nenclei of comets, as masses, are subject to gravitation, whilo the vapors developed from them yield to the action of the free electricity of the snn. Investigations and researches lead to the remarkable result that, supposing the free electricity of tho sun to be no greater than that repeatedly observed upon the earth's surface, and to he uniformly distributed, it would give a sphere, 11 millimeters in diameter and 1-100 milligram in weight, a velocity of 408.4 geographical miles per second, or 70,540,000 geographical miles in two days, in which time the comet of 1680, when ncar its perihelion, developed a traiu of 60,000,000 miles. Thess arc magnitudes of the same order and show that it is sufficient to attribnte to the sun electrical energy not greater than that observed on the earth's surface to account satisfactorily for the appearances presented hy cometic trains.

Furthermore, comets have appeared with trains directed towards the sun, and such a direction is easily explained by the supposition of opposite instead of like electrical characters, which accords perfectly with the phenomena observed in the development of electricity hy vapor-streams in the hydro-electric machine. The theory acquires an additional interest and strong confirmation from Schiaparelli's discovery of the identity of tho paths of certain comets with great meteor-streams.

Nature of the Action in Galvanic Batteries.

Prof. G. W. Hough, of the Dudley Observatory at Albany, N. Y., has, according to the *Journal of the Telegraph*, made a series of experiments on galvanic batteries, for the purposs of investigating the canse of the decline in the strength of the electric current after the battery has been in operation for a long period. Soms of the leading conclusions reached by Prof. Hough were as follows:—

1st. In the sulphate of copper battery (Daniells form) the principal cause of decline in the strength of the electric current is due to the formation of sulphate of zinc.

2d. The quantity of electricity flowing in the external circuit depends upon the specific gravity of the sulphate of zinc.

3d. When the sulphate of zinc approaches saturation, polarization takes place in the battery itself; and, although the electro-motive force remains the same, the internal resistance may be increased more than a hundred times.

4th. The sulphate of zinc (or any fluid abont the zinc) is only useful as a conductor of electricity.

5th. The copper, or negative metal, is useful only as a conductor, since it may be replaced by any other metal, even zinc itself.

6th. The internal resistance of the battery has been separated into two parts, viz., that dne to the porous cell and that due to the liquids employed. The specific resistance of the liquid was found to he 13; that for a small clay cell, 17; and for a leather cell, 7. Since the resistance of the leather cell is less than one-half that of a clay cell, it has been used in the construction of batteries at the observatory, as the quantity of electricity is nearly doubled without any increase of surface. For the negative metal, in place of the copper hitherto employed, we have used sheet-lead.

These investigations have rendered it possible to compute, with great precision, the length of time a battery will generate its normal quantity of electricity, provided the amount of electricity flowing in the external circuit is know, and the capacity of the vessel holding the sulphate of zino is determined. The specific gravity of the sulphate of zinc should not be less than 15 or more than 38 degrees Baumé.

A uew mechanism for the more thorough investigation of galvanic batteries has been devised by prof. Hough, but not yet constructed, by which the quantity of electricity flowing in the external circuit will be recorded in the form of a curve so long as the battery is in action.

NEW AND POWERFUL THERMO-BATTERY.—Noe, of Vienna, has invented a battery with the negative metal of an alloy, like German silver, in the form of a wire, and the positive, also a secret alloy, in cylinders cast round the wire. The wire is protected from the flame by a copper cylinder, insulated from the positive metal by a piece of mica. One of these elements equals in electro-motive power 1.24 to 1.36 Jacobi-Siemens' units; therefore niue to ten Noe's elements equal one Daniell cell, and 20, one of Bunsen's. A battery of 72 elements, when arranged for intensity, decomposes water rapidly; in two series of 36, puts in complete action a moderate sized Ruhmkorff coil; and in four series of 18, produces powerful elcctro-magnets.—*Pogg. Ann.*

MECHANICAL PROGRESS.

Economy in Blast Furnaces.

The *American Exchange and Review*, in speaking of the enormons waste attendiug the operatiou of furnaces of all descriptions, says: "Accurate experimente havo demoustrated that thore is as much heating power in ono pound of coal. This startling assertion was brought out at a recent meeting of the British Iron and Steel Institnte, iu the course of the reading of a paper ou mechanical puddling—a subject which is attracting much atteution among iron masters of both sides of the Atlantic.

As it is well known that puddling can not be carried on at a less heat than that usually obtained, and as the prodncts of combustiou which escapes into the chimney attaiu an average temperature of 2,033 deg. Fahrenheit, the qucstion has ariseu whether some of this waste heat can not bo utilized, and thus effect a saving of the fuel.

An inventiou intended to accomplish this purpose has beeu brought out at Middlesborough, England, whereby a furnace is used, which in appearance is not different from an ordinary furnace and which is thus described:—Above, the neck of the chimney is enlargened into a chamber, divided into two compartments by a vertical cross wall reaching nearly to the top. One compartment is fitted with a damper capable of barring the passage, and the other contains a cellular stovepipe. The dividing wall is perforated by two apertures, one on either side of the stovepipe, and close to the hase thereof. The chamber is surmounted by an iron cased chimney carried in snch a way as to hc independent of the brick work for support. Wheu the damper is open the products of comhustion pass hy it the nearest way to the chimney. When it is closed they are forced to pass through the tyvo apertures on either side of the stovepipe, which they heat, as well as the stove box in which it stands, and so to the chimney. Counected with one side of the stove box, which is divided in to two compartments, is a vertical funnel-pipe down which a steam jet constantly blows. Air is introduced with the steam, and the mixture is forced to pass up and down the heated stovepipe, and is then conducted through the back of the furnace to an ash pit closed by doors. A portion of the blast can he allowed, hy opening a valve, to enter the crown of the furnace just above the fire-bridge, in jets, through especially made tuyere bricks. The steam must be dry, and as high in pressure as possible. The jet is one-eighth of an inch in diameter at the orifice. Aboutsixty-five pounds of water must be evaporated per hour to maintain it. The pressure of the blast on leaving the stove chamber represented hy a column of water one quarter of an inch high, and the average heat is 550 degrees Fahrenheit. The products of combustion immediately above the stovspipe average 1,577 degrees Fahreuheit.

COUNTERPOISE.—Quite a discussion is now going on in some of the mechanical journals regarding the utility of counterpoise, on a crank, pulley, or other motion—some contending that it is not necessary, while others assert that no piece of machinery is correct without being counter, or equipoised perfectly. The latter party are nearest right. In short every other doctrine is wrong. There should he no question on this point, whether applied to cranks, pulleys, pitmans or anything else which is carried around a central hearing and is operated on by a force which contributes an initial velocity and is then broken up before the center is passed. Cranks particularly should be counterpoised, even though they are remote from the power by which they are driven and even though there should he a "fly" wheel attached to the machinery sufficiently large to overcome the weight of an hundred cranks. It is not so much the effect of the weight of the crank against the power, which should be guarded against in this case, as the effect of this weight upon the action of the machine to which it is directly applied. The least preponderation of motion will militate against smooth action, and eventually wear at certain points in such manner as to soon give space for lost motion. Machinery should in every case be perfectly balanced. Any other doctrine is wrong.—*Manufacturer and Builder.*

POWER OF A LOCOMOTIVE.—The driving wheels of a locomotive revolving with a velocity of twenty-eight hundred feet per minute at point of contact with the rail, aud the traction of all comhined being equal to six tons, the apparent effect will be this weight multiplied into the stated velocity, representing the power exerted by the locomotive. The number of foot pounds thus determined would be over thirty-three millions, or an equivalent for ahout one thousand horse-power—over five times the power a locomotive of such dimensions is capable of exerting.—*Leffel's News.*

To the above the *Manufacturer and Builder* adds: "We believe it has been thoroughly demonstrated that but little differeuce is made in the power of traction, either by speed or by increasing the surface of contact, results usually showing that the most that can be depended on is about one-fifth of the weight of the moving vehicle."

The Future of American Iron.

The opinion lately expressed in an article on the probable futnre of iron manufacture in thie and other countries, that the iron industries of Great Britain were rapidly and inevitably receding from the limit of their greatest possiblo expansion, finds ample confirmatiou in the present condition of tho British iron market, and fully agrees with the views of those best able to forecast the future of the trade. A comparisou of prices current in tho English market, with the quotations of eighteeu months ago, shows that, during this brief period, the value of iron in its various forms has increased from 50 to 80, and, in soms instances, 100 per cent., and there is every warrant for the belief that prices are not yet so high as to threaten a break in the market hy causing an apprcciable falling off in the consumptive demand. Even at the prcseut high prices, the demand is so active that the British iron masters could sell the products of their furnaces and mills for many months in advance if they were willing to do so, hut the neccssity of depending upon foreign sources of supply for ores to supplement the failing production of the British mines, renders the futnre of iron manufacture in that country so uncertain that contracts for future delivery are only accepted conditionally, and with extremo caution in some instances, and in others refused altogether.—*Age.*

STONE TURNING APPARATUS.—Mr. J. B. Drunion, says the *Iron Age*, has invented an apparatus for turning and polishing granite and other stone, which promises to become of much practical utility. It is described as follows:—"There ars two discs, one placed at the front and another at the back of the stone, inclined diagonaly toward it. Each cuts off from 3-8 to 5-8 of an nch at a time, and moves over about 2½ feet per hour. The two discs thns applied to the stoue—the one a little ahead of the other—reduce its size hy 1½ to 2 in. in an hour. It will do as much turning in a day as a mason can accomplish in a week, and, the mason's tool marks being avoided, the work comes out with a smoother surface—so much so that the first process of polishing is almost saved. The machine on which the patent tools are worked was made in Aberdeen, mostly from patterns designed in the establishment. The laths of the machne have heads similar to those already iu use. They have the peculiarity of possessing two beds. Each bed has saddles and slide rests, and on top of the latter the patentee's tools are borne. The machine is cspahle of working stoues of 16 iuches diameter and under, but arrangements are iu progress for extending its applicatious to work of larger dimensions. Balusters, vases, pedestals, and all sorts of circular molded work are dono very satisfactorily.

IMPROVED ECONOMY IN IRON MANUFACTURE.—The managers of the Cincinnati Railway Iron Works, in which nine of Dank's puddling machines have been put in operation, have effected an important economy in working iron by melting the pigs in a cupola, and running the metal direotly into the puddling machine. By this means, it is claimed a saving of one half is secured in the time which would he required were the iron melted in the furnace attached to the puddler, and it is possible to dispose of two heats per hour in each furnace, running 500 lb. blooms. A thorough acquaintance with the machine shows that light iron can thua he made ahout as readily as rails.

LIQUID FUEL.—A correspondent of the *Iron Age* has thoroughly investigated the manufacture of iron, by the use of Whipple and Dickinson's Patent Liquid Fuel machine, and promises an interesting account of his observations. He says: "Another letter must suffice for this report, which cannot fail to he of interest to those of your readers who have in Pennsylvania such au uulimited supply of liquid fuel, which really will not only save them fifty per cent. in cost of fuel expended, but will neutralize the worst red-short irou into a product rivaling the Low Moor of former days. Until another issue this must be postponed, when there is also to be noted a number of new wrinkles to the trade."

HOOP IRON.—The manufacture of hoop irou is fast getting to be a specialty, limited to those who make no other kind of iron, roll trains being adapted to speed and constructed with a view solely to this purpose. The rolls are turned so that the iron can be rapidly reduced and greater quantity produced with better finish, while very strict attention is given to the selectiou of metals for mixture.

IRON MOUNTAIN ORE.—Mr. Z. S. Durfee, agent for the Bessemer process, has examined the Iron Mountain ore, as produced at Carondolet by the stone coal heat, and pronounces it the hest iron in the world for the purpose of Bessemer steel. Large quantities of the iron are being shipped to Chicago and Clevelaud for the purpose of this manufacture.

INDUSTRIAL schools are now in successful operation in Europe, and especially in Germany, where children aud youth, for five hours a day, attend educational institutions similar to our public schools, and in addition are required to spend two or three hours in practical schools, where a thorough knowledge is imparted of drawing, designiug, modeling, spinning, weaving, dyeing, mixing of colors, and the use of tools and machinery.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

ALPINE COUNTY.

Alpine *Miner*, July 6: Drift No. 6 of M. & N. W. No. 3 lower worke is loooking fine in its raise and improving in the face. The N. W. drift indicates the approach of the great body of ore of the mine.

TWO SHIFTS of miners are pushing the main tunnel of M. & N. W. as fast as the somewhat refractory nature of the rock will allow.

GETTING READY.—Alpine *Chronicle*, July 6: The sawmill of the Exchequer M. Co. is heing put in order for the cutting of 500,000 ft. of lumher for the Excheqner, I X L, and Accacia mines.

ACCACIA.—Work on this tunnel was resumed this week.

I X L.—In about two 2 weeks hoisting works will arrive, when work will be resumed. As soon ae they are in position sinking will commence to prove the mine.

AMADOR COUNTY.

NEARLY COMPLETED.—Jackson *Ledger*, July 13: The hoisting works and buildings at the Amador, recently destroyed by fire, are nearly completed, the engine and hoilers heing repaired and in position. It is expected that the mill will start up in a few days.

AMADOR.—The Bunker Hill has strnck very rich rock on the 170-ft. level. The Original Amador will he ready to start up in a few days, with new machinery, when we expect to record its regular $35,000 to $40,000 per month. The Keystone remits its regular $40,000 per month. Prospecting is going on in the El Dorado.

CALAVERAS COUNTY.

GWIN MINE.—San Andreas *Citizen*, July 13: Everything is progressing finely. The 16 stamps now running are giving large returns and the pay rock is coming in handsomely in the lower levels; a large body of good ore is being developed in the south end of the south shaft.

ANGEL'S Co.—They are working on the 500-ft. level, having strnck the vein 20 ft. wide, and the rock many times richer than ever hefore.

STRUCK IT.—Calaveras *Chronicle*, July 15: The Hughes Bros., on the blue lead in Chili Gnlch, just helow the What Cheer, have struck pay gravel. They have run an incline to the bottom of the channel, 425 ft., and a straight tunnel from the hottom of the incline, 50 ft. They have commenced putting up water-power hoisting works.

EL DORADO COUNTY.

MOVED.—Placerville *Democrot*, July 3: The Green Mt. Tunnel Co., Cedar Hill, have purchased the old Taft mill, at Smith's Flat, and are pntting it up at the mouth of their tunnel in Chili ravine.

IMPROVING.—The quartz ledge recently discovered a little to the north of the city, improves as opened. At 35 ft. they have a ledge 22 inches wide.

POCAHONTAS. — Placerville *Republican*, July 11: The mill of the Pocahontas M. Co., is undergoing a thorough overhauling, and a new and immense hoiler is being pnt in place of the old one. In the mean time work in the mine is being vigorously prosocuted, and an immense quantity of good paying rock is rapidly accumulating.

FRESNO COUNTY.

BALTIMORE.—Millerton *Enterprise*, July 10: The appearance of the Baltimore Copper mine, at Buchanan, is improved.

FROM the mountain gulches, we learn that the miners are meeting with success and taking out considerable gold.

KERN COUNTY.

CASTRO.—Havilah *Miner*, July 6: Mr. Wattiez hrought down $800 worth of gold last Tuesday from the Castro, the result of a few day's rnn.

LASSEN COUNTY.

SUSANVILLE. — Virvinia (Nev.) *Enterprise*, July 9: Those at work in the new placer diggings, 5 miles south of Snsanville, are making from $5 to $15 per day, and on some occasions as high as $50 has heen taken ont in one day by one man.

NEVADA COUNTY.

COARSE GOLD.—Grass Valley *Union*, July 11: On Monday last H. L. Roherts and J. McCauley picked up on Randolph Hill, near rough and Ready, a piece of gold worth $12, and on Tuesday they found a chunk weighing 13¾ozs., worth in the neighborhood of $250.

TRINITY COUNTY

STUART FOLK DITCH.—Weaverville *Journel*, July 6th: O. M. Loveridge will commence the survey of the hig ditch on Monday next.

BROKE DOWN.—Same paper Jnly 13th: About 90 ft. of the flume across Trinity River at Evans' Bar, helonging to McGovern and McGrath, fell on Sunday. This was the highest flume in the country, heing ahout 125 ft. high.

TUOLUMNE COUNTY.

EXCELSIOR.—Sonora *Independent*, Jnly 13th: The Co. are down 139 ft. on the vein, which shows from 15 inches to 4 ft. in width. J. K. Owens has contracted to put np a 10 stamp mill, which is calcnlated to he in running order within 60 days.

CITY MINNING.—G. S. Reuter is mining the lot under his house. Several pieces of quartz, ehowing ahundance of gold have been fonnd, aud the prospect is that he will have a good thing of it.

Nevada.

EUREKA DISTRICT.

RICH ORE.—Eureka *Sentinel*, July 10: Some of the mines on Coy Hill are yielding ore which assays from $300 to $1,000 per ton.

HOISTING WORKS.—The Eureka Con. people are putting matters in shape for their new hoisting works.

IN OPERATION.—The Phenix smelting works are in successful operation, with an ahundance of coal and ore on hand to make a successful and remunerative run.

RUBY HILL TUNNEL.—The tnnnel has a length of 140 ft. in shale limestone, that can be worked at a small expense, and from appearances they will soon strike ore.

HUMBOLDT.

BUTTE M. & M. Co.—Hnmboldt *Register*, July 6: The Co. at Rye Patch, are erecting a Stedefeldt fnrnace, which will he in operation hy the 20th of Jnly.

THE Winnemucca Reduction Works are nearly completed, and will he ready for operation hy the 15th of the month.

RYE PATCH. — Unionville *Silver State*, July 13: The new Stedefeldt fnrnace, bnilt for the Butte M. Co., Rye Patch, is completed. The new mill which has heen running on tailings since its completion, will commence crushing next week, at which time the furnace will also he fired up. The Butte mine is yielding rich ore.

ELY DIST.

BULLION.—Ely *Record*, July 7: During the past week W., F. & Co. have shipped hullion valued at $95,133.81.

For Juue, W., F. & Co. shipped hnllion valued at $467,431.52, exclusive of hetween $40,000 and $50,000 shipped on the last day of June and included in the July shipment.

INGOMAR.—On Friday night a ledge was strnck in the Ingomar, Panaca Flat, which, up to present writing, has heen gone in on 6 ft., with no sign of a foot wall.

SUNBEAM.—Drifting on the 200-ft. level continnes on the ore hody mentioned as having been struck, with the ore showing from 18 inches to 2 ft. in width. A purchase of the old Barton mine was made by the owners of the Sunheam on the 26th. To-morrow a force will be placed at work sinking the Barton shaft to a level with the drift being run west from the Sunheam.

EXCELSIOR.—Drift on the upper level in 120 ft., on ore the entire distance. On the lower level the chimney of ore in the ledge has heen cut 50 ft. from the shaft. Sinking of winze from the 150-ft. level to open a new station at 100 ft. continues with good progress. Have 1,000 tons of fine milling ore in sight.

AMERICAN FLAG.—East stope and east raise continne looking exceedingly well. Expect to cut the ledge in the west drift in 4 or 5 ft. more. Timhering of shaft is almost completed. Part of machinery for the new hoisting works arrived on Friday, and is being placed in position. The mill is not running at present and no ore will be shipped until the hoisting works are completed.

STIRLING.—Men employed in timhering the shaft, which is 150 ft. deep, and shows the ledge the entire distance. A great improvement in the character of the ore is noticeahle in the last 10 ft. sunk. Some little water is at present coming in at the hottom.

MOCKING BIRD.—The ehaft is down 40 ft., and still sinking, with the ledge showing hetween 4 and 5 ft. in width on the hottom. Assays taken during the past week show an average of over $120 per ton. They have a quantity of good ore on the dump.

HARPER.—Drift south from hottom for ledge in 17 ft., and as yet have not cut into it.

LOUISE.—Work on Anna Dickinson continues as usual, with the ore hody coming in stronger and richer as opened np on. The contract on the Goodspeed will be commenced in a few days. Work on the Grattan contract is going steadily ahead, and ore improving.

PAGE & PANACA.—All the machinery of the hoisting works is on the gronnd. The gallows' frame is in position over the shaft, and the timhering of the mine throughout has heen completed.

CONDOR.—Main shaft down 150 ft., and shows good ledge in the hottom, assays from which have averaged $123 per ton during the past week. A large amount of ore is on the dumps.

CHIEF OF THE HILL.—Siuking the main winze to make connection with the lower level. Stopes looking well and ledge shows at that point about 2 ft. of solid ore. The east drift on the lower level is looking extremely well, and ehows 2½ ft. of solid ore in the face.

NEWTON BOOTH.—Getting the hoisting machinery into position rapidly and will start up again soon.

NEWARK.—Cribhing of shaft continnes. The engine is expected to arrive about the 20th instant.

MEADOW VALLEY.—Stopes and drifts continue to look well and yield ahundantly. The lower levels of No. 3 show a great improvement since our last, and the ore extracted is of much better quality. The Summit hoisting works are nearly ready to start up.

BOWERY.—Prospecting continues. Mill is running steadily and works finely throughout.

TOWNSEND.—Indications are favorable for ore.

CHAPMAN.—Stoping on ore continues; also raising of ore to the surface. Shaft 300 ft. deep.

REESE RIVER.

BULLION.—Reese River *Reveille*, Jnly 6: There were shipped through the office of W., F. & Co., in this city during Jnne, 57 hars of silver hullion, weighing 5,929 lbs., of the value of $73,740.56.

BELMONT.—In the El Dorado South the pump has heen lowered 48 ft. since the 8th inst.; the drifts are heing pushed with equal vigor. The Monitor Co. are taking out very rich ore.

SOME prospectors have heen for a few weeks engaged in prospecting in the old Manhattan Dist., ahout 15 miles from Belmont on the Silver Creek trail. Some of the old shafts which had heen filled up have heen cleared and assays of $300 rock ohtained. The ledges are reported large, hut the rock is generally of a grade of ore that will not pay much more than day's wages, until lahor and redncion is cheaper.

IONE AND ELLSWORTH — INDIANAPOLIS MINE—(IONE.)—The ore from the 270-ft. level, now heing milled, assayed $349 per ton. The Co. is extracting and sending to mill ahout 2½ tons per day. Beatty, Sargent & Co., owners of the North Star, Crown and other mines are doing considerahle work.

AMERIOAN FLAG—(ELLSWORTH.) — The incline has reached 218 ft., and some very fine sulphuret ore is being raised.

ESTA BUENA.—This mine has just heen sold to a S. F. incorporation. The new Co. propose to largely increase the working force at once.

WASHOE.

LOOAL SUMMARY—IMPERIAL EMPIRE.—Gold Hill *News*, July 13: The drift east at the 1,500-ft. level shows only clay and quartz at present, with no sigu of the east wall. Last Tuesday afternoon the 1,650-ft. or lowest level unexpectedly run into ore which snbsequently opened ont into a very good hody, assays from which run from $100 to $400 to the ton, gold predominating at the rate of 65 per cent. It was struck by the southeast drift, rnnning across it somewhat diagonally. The streak or hody shows ahout 9 ft. in width, and the drift has not passed through it, therefore its actual width is not known. Assays taken from the face of the drift thie morning averaged $111.26 to the ton. It dips east with the ledge. About 50 tons of ore has heen taken out, which will he raised and pnt into the dump for milling next Monday.

OVERMAN.—The main drift west on the 1,000-ft. level is in 405 ft. in ledge matter, showing excellent indications. The shaft is down 90 ft. below the 1,000-ft. level and progressing well, although there is a steady increase of water from the bottom.

OPHIR.—Just finished putting in two more fine 52-inch boilers. The shaft is down 110 ft. below the 1,300-ft. level, with the sinking good, though somewhat harder than at onr last report. Sinking the winze in the south drift of the 1,100-ft. level has been discontinued for the present. The north drift of this level is still pushed ahead with energy. The work of opening the 700-ft. level to the point at which they expect to drift will be completed in two or three days.

BELCHER.—Daily yield, 275 tons, from the 1,100 and 1,000-ft. levels. The 1,000-ft. level is showing finely, and the drift sonth is in 160 ft. from the Crown Point line, the face heing in the finest kind of ore. The total yield for June was 6,797 tons of ore, averaging $58.43 per ton, and amounting to $407,772.37.

YELLOW JACKET.—Daily yield 25 tons, from the old workings. The hoisting engines are heing fitted with new 16-inch cylinders, therefore nothing is heing done on the main incline at present. The main drift at the 1,300-ft. level is heing continued north in order to connect with the long winze from the 1,100-ft. level for ventilation and prospecting purposes.

CHOLLAR POTOSI.—Daily yield 185 tons, worth $11 per ton. The work of retimbering the shaft is progressing finely, aud the Co.'s mills are kept steadily running. The total shipment of bnllion for Juue amounted to $78,230.

SAVAGE.—Daily yield 160 tons, worth $28 per ton. The incline is down 90 ft., and making good headway. All work on the 1,500-ft. level is suspended for the present.

KNICKERBOCKER.—Shaft down 385 ft. and passing through occasional feeders or stringers of very fine looking quartz from the main ledge. But little water is encountered, and next week the shaft will he down far enough to [allow of the 400-ft. station heing put in.

SUTRO TUNNEL.—Total length 2,957 ft. The rock is hard, yet works well, allowing of fair progress heing made.

GOULD & CURRY.—The incline is down 90 ft. helow the 1,500 ft. level in good sinking ground.

BUCKEYE.—Sinking the main incline is progressing. It is in the west wall of the vein, and will open out a good body of ore judging from indications above.

CROWN POINT.—Daily yield about 500 tons, from the 1,100-ft. level and the floors above it. The ore breasts all show splendidly.

KENTUCK.—Daily yield about 60 tons, from the old workings, which hold out well. Total receipts for June, $8,871.14.

WHITE PINE.

TREASURE HILL MINES.—EAST SHEBOYGAN.—White Pine *News*, July 6th: hreasting out from the north works continues, and the ore is of the same satisfactory character. Working ore at Swansea mill.

COPPER GLANCE.—The northwest drift and north shaft rnnning on contract. A body of good ore is in sight in the north drift, 27 ft. from the surface, with every indication of holding out.

O. H. TREASURE.—There is quite an improvement in the ore hody in the lower tunnel. Some of the finest chloride ore we have ever seen in the Dist. is heing shipped to mill. The Wheeler tunnel is progressing rapidly. The new contract to he let is for 50 ft., or to ore. Mill steadily going.

PENNSYLVANIA.—Sinking 2 shafts with the nsual force, in vein matter. It is expected the ore channel will he reached at a depth of 50 ft.

SAN JUAN DEL RIO.—Work is progressing finely, the ore body increasing as depth is attained, and the grade of ore improving.

HAMILTON M. & M. Co.—The millright, has put the mill in fine condition, and will be ready in one week to commence crushing ore. It is the intention to put up a White furnace to operate on our most refractory ores The Pogonip & Othello mine show good hodies of ore.

CHARTER OAK.—Connection is made hetween the north tnnnel and south shaft. Good mining ore is found in the tunnel.

THE MINES.—Schell Creek *Prospect*, July 6th: Work is progressing on McMahon, Jnpiter and other mines. The McMahon is improving in appearance every day, aud large qnantities of rich ore are heing extracted. The owners of the Schell Creek are running a tuunel in ahout 150 ft. to cut the ledge. The snpt. informs ns that he expects to strike the ledge inside of 30 ft. In Queen Springs the miners are looking hetter than ever. Work is progressing on the Great Western War Horse La-Bross Tunnel and eeveral other prominent mines. In Ruhy Hill everything looks promising. The Silver Wreath is turning out to be the richest mine in Nevada. There is a hreast of ore 15 ft. wide and 20 ft. high of great richness. Several tons of this ore will work over $2,000 per ton and the bulk of it will average from $300 to $500. The Cow and Calf will donhtless prove equal to the Silver Wreath. The Birch, Wide West, Look Out, Snnburst and others are improving in quantity of ore.

Arizona.

MINES AND MINING.—MOHAVE Co.—Prescott *Miner*, June 29th: Hardy's little mill is rnnning and paying, and Mr. H. has procured a larger and hetter mill. E. M. Smith, Mr. Wheeler and others, are

opening mines in the Cerbat and Wallapai ranges.

YAVAPAI CO.—Our miners keep at work, taking out a little gold dust.

T. W. Brooks, Sup. of the Del Pasoo, brought considerable dust to town a few days ago.

HUALAPAIA.—The Elder furnace is not doing very well, the ore being better adapted for milling. The great drawback is a scarcity of water for milling purposes. The developments made in the sinkings in the mines are favorable. The mill at Mineral Park has lately worked up 5 tons of ore from the Donahue, which yielded $1,680 per ton. Mr. Parsons reports that out of 180 assays made by C. Pletz at Cerbat, the average assay yield obtained was a trifle over $240 per ton.

THE MINES.—San Bernardino *Guardian*, June 29: We learn from Mr. Brazelton that matters out at Wallapai, and vicinity are pretty dull.

On his way in he was informed by responsible parties that very rich lodes had been struck in the McKenzie Dist.

Colorado.

CARIBOU.—Central *Register*, July 3: Congar and J. Hill have a number of men mining ore from the Boulder Co. lode, which runs from 4½ oz. to 15 oz. in gold per cord.

Sears, Burd, Herzinger & Co., have recently purchased the Orlington lode. The second-class ore runs 6 oz. per cord in gold.

The Gentryville lode on the northern slope of Caribou Hill, is looking finely.

SUMMIT CO.—Col. Fuller and Greenleaf are tearing up the ground one half mile below Breckenridge at their two big flumes, at a fearful rate, besides working some 40 men at the head of Negro Gulch and other places.

Ezebett, Pollock & Co., have leased their flume at the mouth of French Gulch.

Next above, the property known as the McFadden, lately sold to Price & Parker for about $80,000, is being overhauled and a new flume put down.

THE Glasgow lode is being worked, and gives promise of a fair yield.

RICH silver lodes are being discovered nearly every day on Brown Mt., Georgetown.

THE Fourth of July lode is again producing ore, which yields 10 ozs. per cord.

THE ore in D. D. and Andy Johnson lodes, Cascade Dist., is improving in quality, and the crevices are growing wider.

PARTIES in Ellsworth Gulch, are making fair wages, with good prospects ahead.

COAL.—Colorado *Miner*, July 4: A massive vein of valuable coal has been discovered near Hamilton, Park county.

CLEAR CREEK county, in 1872, will ship silver, in bullion and ore, to the amount of $4,500,000.

WARD DIST.—Longmont *Press*, July 3: Mr. Davidson has started the Niwot engine to pumping, preparatory to going to work.

Chris. Hulverson has run 4 cords of ore through his mill, and cleaned up $1,200.

Joss Hartley and Henry Wells einking on the Moscow. They have a 3 ft. crevice, the ore from which assays $125.77 gold per ton.

Hulverson's mill is running night and day on ore from the Columbia, Slater, and Nelson lodes.

MTS. LINCOLN AND BROSS.—Denver *Tribune*, July 10. The Wilson lode is looking very fine. The crevice is from 2 to 3 ft. wide, and the ore assays from $300 to $600 per ton. Near hy, is the "Red Bird." It has 4 ft. of ore that assays about the same as the Wilson. Then comes the "Lincoln." It has a good crevice of ore that assaye from $200 to $400 per ton. Next is the "Musk Ox," tho ore assaying from $1,000 to $1,400 per ton. Further up is the "Gem," "Astic," and "Present Help," all good sized veins, the value of ore ranging from $400 to $1,000 per ton.

On the Divide, between Lincoln and Bross, Mr. Beckwith has 3 lodes that look very promising, the ore assaying as high as $1,100 a ton.

Sykes, McLaughlin, and a host of others, have some very rich discoveries on the north spur of Mt. Lincoln as yet undeveloped.

Prof. Peters will erect reduction works at Alma soon.

Idaho.

LOCAL RECORN.—Owyhee *Avalanche*, July 6: The Ellmoro and Mahogany are looking splendidly. The Ellmore shaft is down 86 ft. below the 7th level, leaving about 25 ft. to sink for the 8th, which will give 100 ft. of backs and a 10-ft. sump.

The Sup. of the Golden Chariot, hopes to have the shaft completed this month.

The Mahogany 5th level drift is in on the vein about 290 ft., and the first stope above the 5th level is a little over 200 ft. long—the only stope yet run to the end of the shute of ore. The shaft is down 30 ft. on the ledge, which shows A No. 1.

The South Chariot is being opened in good style. The shaft is down 75 ft. for the 4th level, carrying a good vein of ore all the way.

The Minnesota has struck splendid ore in the 3d level south, and connected that drift with the winze from the 2d level. The South Chariot mill is running on Minnesota ore.

The erection of the Empire hoisting works is delayed, on account of some portion of the machinery not being shipped from Winnemucca.

In the North Oro Fino the 3d level drift has about 50 ft. yet to run to connect with the old engine or Surplus shaft.

The pauper shaft is down 48 ft. on the new contract. The vein is 20 inches wide, splendid ore. The water has increased in the shaft from 5 bucketsful in 24 hours to 5 buckets in one hour, which is regarded as an almost infallible sign of being close upon a large ledge.

The repairing of the War Eagle shaft is about completed, and the mine is looking better than ever.

The Revenue is yielding fine looking ore, in much of which can be seen free gold.

Water is falling in the placer diggings, and preparations are being made for cleaning up the season's run, which will pan out better than for years.

Montana.

PHILIPSBURG.—Helena *Herald*, July, 4th: The St. Louis mill has been changed to dry crushing, (with roasting furnaces attached). It is running on speckled trout ore. The yield per ton of ore is nearly $140, and the mine, at a depth of 127 ft. is 11 ft. in width, showing clear across it ore yielding on an average $160 per ton.

MADISON CO.—Cor. same: Stites, Brigham & Co. are running 2 hydraulics, averaging about $10 per day to the hand. Parkman and James are running 2 hydraulics, and making good wages. In Clark's gulch 2 pipes are running with good pay. These is considerable excitement about the Cherry Creek silver mines, and many in this direction have "solid silver" diggings.

BANNACK.—Cor. same: Waddams & Shenon cleaned up 48¼ ozs. of gold, the result of 10 days run with an arastrs, on quartz out of the Waddams lode.

The "Butterfield" mill has run through a few tons of silver ore from the "Huron" lode, with very favorable results.

The placer mines are being worked and are paying as well as could be expected.

BULLION.—Deer Lodge *Independent*, July 6th: 807 lbs. of silver bullion was brought from Philipsburg this week, the proceeds of ons clean up.

Ophir,—Cor. Deer Lodge *New Northwest*, July 6th: Ophir Gulch is occupied by Chinese miners who realize as high as $12 per day to the man.

Utah.

MORE.—S. L. *Tribune*, July 9: Walker Bros. are in receipt of 5 bars of bullion from their Pioneer Mill, East cañon, worth $7,121.72 coin.

HOWLAND DIST.—Some fine prospects have been struck in White Pine Cañon, about 2 miles west of the Howland mine. Assays from the Lawrence show about $100 to the ton with a fair prospect for plenty of ore.

RUNNING.—The mill at Camp Floyd recently erected by Capt. Shaw, has started up and is running splendidly.

ANTELOPE.—The Antelope has opened up magnificently, showing a vein of 5 ft. of solid galena, with 10 ft. of ledge matter, the ore assaying 65 per cent. lead.

RICH STRIKE.—The workman on the Silver Cloud, Camp Floyd Dist. have just struck a new and very rich deposit of ore, at a depth of about 124 ft. The ore is principally chlorids mixed with black sulphurets and horn silver. The deposit is said to be large and continuous and assaye from $477 to $1,800.

WORK IN TINTIC is being carried on vigorously on the Sunbeam and other lodes. The Undine, Sydona and other mines are shipping ore to Walker Bros' Pioneer mill with satisfactory results. Several other mines have ore on the dumps, and are preparing to ship to East Canon. On Eureka Hill work is being pushed. At Diamond the Joe Bower, Saratoga, Isabel, Victoria and other good claims are being worked on with satisfactory results. The Isabel, down 150 ft. is said to have a large vein of ore in sight.

MINING ACCIDENTS.—Two miners, named Cain and McCanley sustained serious injuries last week in the Gwin mine, Calaveras county, by a rock falling upon them.

John Herron was killed on the 3d inst., in the Rising Star mine, Flint District, Idaho, hy falling a distance of eightly feet down the shaft.

Samuel W. Steele was killed on the 2d inst., hy a cave in the Buena Suerte mine near Belmont, Cerro Gordo District, Cal.

San Francisco Metal Market.

NOTES.—†—California. *—Washoe. ‡—White Pine. §—Ely District. ¶—Eureka District. ‖—Idaho. ¦—Nearly. ⁂—Over.

S. F. Stock and Exchange Board.

THURSDAY, July 18, 1872.

There has been quite an excitement in stocks during the past week, and California street has presented an appearance of activity reminding ons of the flush times of March, April and May. The respite given to the members of the Board by their short vacation on and after the 4th of July, seems to have awakened them to new vigor. A reported strike in Savage sent that stock up suddenly, and the adjoining mines with it. Hals & Norcross particularly, showed a very decided advance. The men in the 1600-ft. level of the Imperial encountered a seam of ore, and the men were immediately shut up in the mine, according to reports. Alpha and Exchequer, both near the Imperial, felt the influences of this rumor, and both went up accordingly. The Superintendent of the Pioche mine reported that on the new ledge, after running 40 feet on the vein, he had developed a body of ore three feet wide. He again wrote that when in 55 feet, the face of the ledge showed five feet of ore, assaying $400 per ton. This brought up the Ely stocks of course. The Virginia *Chronicle* of the 12th said that the vein or bonanza in the Imperial carries five feet of very rich and four feet of fair milling ore. On the 17th inst. Comstock stocks were down again, but Ely stocks were firm at the prices at which they sold two days before.

On Friday the 12th inst., stocks were active and showed a decided tendency upward. From highest rates from previous morning's sales Alpha advanced $1, Belcher $55, Bacon $25, Baltimore $1, Bowere $4, Caledonia $1, Chollar Potosi $5, Consolidated Virginia and Confidence each $3, Exchequer $1, Gould & Curry $11, Hale & Norcross $5, Justice $2, Julia $1, Knickerbocker $4.50, Ophir $2, Overman $5, Savage $5, Segregated Belcher $4, Silver Hill and Trench each $1, and Yellow Jacket $6. Kentuck was $15 lower.

On Saturday a large business was transacted by the Board, and the market was in an excited state with plenty of buyers. From highest rates on Friday Kentuck advanced $30, Segregated Belcher $24, Overman $18, Yellow Jacket $12, Caledonia $8, Consolidated Virginia $7, Pioche $6, Gould & Curry $4, Savage and Justice each $2, Confidence, Hale & Norcrose, Julia, Ophir and Silver Hill each $1. Exchequer declined $6 Raymond & Ely $3, and Alpha $1.

On Monday the streets were crowded long before the Board met, and mining stocks were in great demand. The Board met at noon and the seseion lasted till 2 o'clock. Most all descriptions were higher; the principal rise however was in Savage, Gould & Curry and Hale & Norcross. From highest rates ou Saturday, Belcher advanced $25, Caledonia $5, Chollar-Potosi $16, Consolidatsd Virginia $7, Gould & Curry $30, Hale & Norcross $24, Justice $8, Kentuck $10, Ophir $8, Overman $15, Savage $83, Segregated Belcher $10, Sierra Nevada $3, Succor $1, and Yellow Jacket $10. Alpha declined $5, and Confidence $2.

On Tuesday the stocks were still active but at lower prices. From highest prices on Monday Alpha declined $5, Belcher $25, Calsdonia $5, Chollar Potosi $9, Consolidated Virginia $5, Crown Point $8, Confidencs $1, Exchequer $2, Gould and Curry $25, Hale and Norcross $15, Impsrial $1, Justice $4, Kentuck $10, Ophir $1, Overman $15, Savage $55, Sisrra Nevada $2.50, Silver Hill $1, and Yellow Jacket $18.

On Wednesday all descriptione were still lower and quite a reaction ensned. Alpha declined $5 more, Caledonia $6, Chollar Potosi and Consolidated Virginia each $9, Confidence $1, Exchequer $2, Gould & Curry $17, Hale & Norcross $9, Impsrial $1.50, Justice $2, Kentuck $30, Ophir $6, Overman $13, Savage $22, Segregatsd Belcher $5, Sierra Nevada and Silver Hill each $1, and Yellow Jaekst $6.

To-day the market shows an improvement compared with yestsrday morning's sales. The ealee of this morning show that Alpha advanced $6, Caledonia and Chollar Potosi each $4, Consoidated Virginia $5, Exchequer $2, Gould & Curry $7, Hale & Norcroes $1, Imperial $1.50, Ophir $2, Overman $3, Savage $5, Yellow Jacket $7. Confidence declined $2 and Segregated Belcher $3.

The ore discovery in the Imperial shows five feet wide, assaying from $80 to $200 per ton. A remittance of $10,000 came from the Pioche mine on the 13th inet. The Eureka Consolidated mine reduced 800 tons of ore last week; the Sierra Nevada reduced 400 tons, yielding $3,074. The Eureka (Grass Valley) mine, cleaned up last week 650 ounces of amalgam. The North Star mine reduced 109 tons of ore last month, and raised 90 tons, leaving 70 tons on the dump. The Crown Point mine extracted last week 2,900 tons of ore valued at $117.300; the Chollar Potosi, 950 tons, assaying $39.60 per ton; the Hale & Norcross extracted 575 tone. Shipments from the Raymond & Ely mine on this month's account, up to the 15th, amount to $164,000.

The following dividende have been paid by mining companies this month:

COMPANIES.	AM'T PER SHARE.	AGGREGATE.
Belcher	$30	$312,000
Crown Point	3	300,000
Raymond & Ely	7	210,000
Pioche	1	20,000
Keystone Quartz	50	5,000
Total		$847,000

The following companies have levied assesements since the first of July. Daney, 75c.; Empire, 50c.; Louise, 10c.; Noonday, 25c.; Pacific Borax, 15c.; Phœnix, $1; Senator, 25c.; Spring Mountain Tunnel, 30c.; St. Louis, $1; William Penn Cons., 10c.; Kentuck, 50c.; Pioche West Extension, 30c.; Bowery Cons., 75c.; National, 50c.; Baltimore American, $1; Sterling, 50c.; Sapphire, 30c.; Ophir, $5; Piermont, 60c.; Morning Star, $1; Nevada L. & M. Co., 8c.; Kincaid Flat, $3.

[Latest reports concerning the progress of work and developments in the principal mines on the coast will be found in our MINING SUMMARY.]

For Mining Shareholders' Directory see page 44.

Coal.

The production of Coal in California is heing prosecuted with vigor. The product of the Mount Diahlo mines for the past eix monthe ehows a marked increase over the same time laet year, as will be seen by the following statement:

	1871.	1872.
January, tons	9,332	14,671
February	8,832	13,616
March	10,508	16,030
April	9,157	13,062
May	11,468	14,778
June	11,177	12,289
Totals	60,474	84,446

At leaet 90 per cent. of the product at these mines finds its way to this city, where it is chiefly used for steam purposes. These mines are the only ones worked in the State to any extent. Our other Pacific coast supplies come from Oregon, Washington Territory, Utah and British Columbia. The mines in Oregon and Washington Territory from which we ohtain supplies are at Cooe Bay, Bellingham Bay and Seattle. The receipts from these sources for the six months compare as follows:

	1871.	1872.
January, tons	3,994	2,790
February	4,367	1,404
March	2,010	3,455
April	6,013	3,877
May	4,768	4,497
June	4,371	4,387
Totals	27,423	20,410

The decrease receipts from these mines is easily explained. There was a stoppage of several weeks at the Seattle mine to complete railroad to the water. There have heen no receipts from the Bellingham Bay mine, on account of a fire in the early months of the year, and the repairs suhsequently needed. A veesel wae recently eent there to load, and it is reported that the mine is now all right. Most of the receipts of coast descriptions for the past six months have therefore come from the Coos Bay mines. Hereafter it is expected that the Bellingham Bay and Seattle miues will furnish their usual eupplies. The Rocky Mountain mine in Utah has sent us 771 tons Coal in the past six months all hy railroad. Our imports from British Columbia compare as follows:

	1871.	1872.
January, tons	1,975	420
February	2,327	....
March	.....	4,380
April	1,028	2,280
May	1,000	7,060
June	1,466	2,500
Totals	7,796	16,640

The comparison shows an increase of 9,000 tons from that source. Recently a cargo arrived from the Wellington mine, a new claim in British Columbia. Our Coal importe from Australia compare as follows:

	1871.	1872.
Jannary	.....	4,329
February	4,357	8,890
March	.....	11,640
April	840	9,930
May	4,193	7,982
Jnne	1,554	3,386
Totals	10,944	46,157

Our other foreign Coal importe for the past six months emhrace 5,831 tons English and Scotch, and 3,862 tons Chili, against 2,201 tone English for the same time last year. Our receipts from domestic Atlantic ports for the six months consist of 4,483 tons and 1,193 csks, against 5,452 tons and 2,224 csks for the same time last year. Recapitulating, we have the following receipts of Coal at San Francisco for the first six months of the year:

	1871.	1872.
Pacific coaet supplies, tone..	81,850	97,183
Eastern snpplies	7,232	5,547
Total domestic	89,082	102,730
Total foreign	20,941	72,490
Grand total	110,023	175,220

While the Pacific coast eupplies are steadily increasing, there ie reason to believe that there is more than the ueual quantity afloat for this port. The 25 or 30 vessels on the way here from Australia must have about 50,000 tons, to say nothing of the quantities en route from Enrope, South America and the dometic Atlantic States.—*Bulletin.*

Glaes Works.—For reaeons not specified, the Boston papers give a gloomy report of the glass works of New England. Half of them are lying idle. There is in Philadelphia a single factory of glassware and in New York there are none now at work.

A $5,000,000 tnnnel is to be constructed under the Mississippi at Memphis.

Placers in Santa Barbara.

The new discovery of old gold placers in the San Felician District, in this county, is creating mnch local interest.

To Dr. S. P. Gulberson, who has just returned from there, we are indehted for much useful information concerning them, and herewith give a condensed statement of his report. Thirty-three miles from here, up the north hank of the Santa Clara river, and over one of the best natural roade in the State, the searcher after these new-old mines finds himself at the confluence of the Piru river with the Santa Clara. The Piru is a heautiful little river, heading high up in the mountains, east of Fort Tejon, and at all seasons affords a beautiful supply of the purest, sparkling waters. At all points on this stream gold has been found, and a few milee up hae heen worked every year to some extent; and, it is eaid, with profit during the winter eeason. Following up its east hank ahout eight miles, the wayfarer finde himself at the mouth of San Felician creek, a branch of the Piru. Here the country hecomes exceedingly broken. The hills and the hluffs are precipitous, rocky and difficult of ascent.

Following up this creek four miles, the mines are found that are now making so much talk. The principal placer is a large red hill, which hae been tunneled and worked for many years, after the most primitive fashion. There is no water for washing, except a minute quantity, which is carefully hoarded from a small spring, and ueed with a pan or batea. The gold is found generally distrihuted from surface to bed-rock and in the adjoining gulches and ravines. A "hit" to the pan is often found, and the Dr. thinks there are many rich-paying placere if water conld be had to work them. The main branch of the Piru, whose course wende far ahove and around these placers, would frnish enough of the element, bnt it is thought that the distance and rough character of the connry precludes any probability of an early attempt to bring it in. The gold is found in coaree grains, and in early times large amounts of it was secured hy "dry-washing." An old miner who has lived there for many years, says that, in the early days, he had seen over a hundred Californians and Mexicane seated on their blankets of a Sunday morning, with heaps of the ehining "dust" at their sides, playing monte.

Several relics of early times have lately been found at these placers, going to prove that they were prohahly known and worked a century ago.—*Ventura Signal.*

Original Amador Mine and Mill.—A few days ago we paid a visit to the above named mine, situated at Amador City, and were agreably surprised to find such extenеive and valuahle works approaching completion as are now being erected in connection with this mine. The mill belonging to the mine was originally calculated to be propelled hy water-power, but owing to the uncertain supply of water during the summer months, steam will take its place. The engine and hoilers are heing put in place and ere long forty ponderous stamps will he engaged in crushing the large amount of valuahle rock now above ground. The building and machinery are of the most snhstantial character, and for compactness, completeness and labor saving, when finished the Original Amador Mill will be eecond to none on the Pacific Coast. From the main shaft the rock is raised to a platform within a few feet of a crneher, run hy steam, where the ore is reduced to a uniform size, from thence it is conveyed hy shutes to hoppers connected with the batteries, the hoppers being eelf-acting supply the stamps, thus dispensing with hands to break the rock, and with feeders to supply the hatteriee. From the batteries the pulp flows through numerous sluiceways, floored with hlankete, where a large amount of fine gold is caught, after escaping from the hatteries; these slnices diecharge their contents into tanks connected with two very large self-acting huddlee, where the remainder of the gold and sulphurets escaping are caught. The buddles after the style of those in use in this mill is something new, aud we think not in general uee, but from careful ohser vation we feel satisfied they will he found a great improvement on those generally in use. Take the Original Amador Mill, in all its appointments, improvements, conveniences and gold saving oapacity, and it will rank, as hefore said, with the best on the Pacific Coast. And what is better still the mine connected with it has heen proven to be of great value, and fully justifies the magnificent and expensive machinery now being placed upon it.—*Amador Ledger.*

Combined Pencil Sharpener, Holder and Twine-Cutter.

Thie little invention, though simple in appearance and construction servee ae a very convenient and almoet indispeneable inetrument to clerks and other pereons who, by the nature of their occupation, are compelled to freqnently use a pencil. The pencil eharpener, shown on the front side of the cut, is made in the ordinary manner, and to one side of it is screwed a clasp which is properly curved to receive the pencil. Between the claep and sharpener ie a blade or knife, which extends from one end to the other of the eharpener. In the preeent instance the edge of the blade is represented as rounded from end to end, which is a very convenient form, although other forms, as a hook, could be used ae well.

Between the clasp and sharpener, on the opposite side, ie a pin fastening by means of which the instrument can be fastened to the clothing. For using the knife the device will be most convenient when attached to the veet near the right vest pocket. The use of the sharpener and clasp will be evident to any one, and they are rendered much more ueeful and convenient by being connected together in the manner described, and attaching them by meane of a pin to the clothing. The knife servee the purpose of a knife or a pair of ehears, to cut twine when the wearer is tying up bundlee or desires to cut a string. The simplicity of this little instrument aud its evident utility will do

much towards introducing it into general use, and clerks, dry goods dealere, etc., will readily appreciate its value. The device has recently been patented through the Scientific Press Patent Agency, by Evan A. Edwards, of San Buenaventura, Santa Barbara Co., Cal.

Alcohol in Wines.

Our article on California Wines, in the Press of June 1st, has attracted considerable attention and called out some candid criticism. We are glad it hae. The wine indnetry of California, in our opinion, is deetined to become at no distant day, one of the moet, if not *the* most important and valuable industries of the State. It is therefore of the higheet importance that everything connected with this industry shonld be fully and candidly diecueed and correct conclusione arrived at, principles established and practices settled. To this end we invite candid discnssion and reliable facts.

A practical wine maker of Sonoma County prompted by the article referred to and the diecussion that has followed, has undertaken to test, with reliable instruments, the wines of all the principal manufacturers of Sonoma and Napa Counties. We will therefore be able soon to lay before our readers the figures showing the per cent. of alcohol these wines contain.

We hope the Vine Growere and Wine and Brandy Manufacturers' Association will take steps to have the wines in all the districts of the State similarly teeted. Such information will be very valuable as a guide in wine making in the future.

For the information of such of our readers as may not have the data at hand, we append a table from Brande's Chemistry, showing the percentage of alcohol in the various kinds of wine from different countries. Thie table will enable those who wish to form an opinion as to what amount of alcohol California wines for table purposes, and for a popular beverage ought to contain.

It will be eeen that the cheap and popular French and German wines—the different clarets and the Rhenish wines as we have stated in the artiole referred to, only contain from 7 to 10 per cent. of alcohol. The heavy wines which are not nsed by thoee people, either on the table, or as a common beverage, contain more.

PORTUGUESE WINE.

Port contains 14.37 to 25.83 per cent. of alcohol
Buccella contains 18.43 " " "

SPANISH.

Sherry contains.....13.98 to 23.85 per cent. of alcohol.
Malaga contains.....17.26 to 18.94 " " "

MADEIRA AND CANARY ISLAND.

Madeira contains 14.09 to 24.43 per cent. of alcohol.
Malmsey " 12.86 to 16.40 " " "

FRENCH.

Claret contains.....12.91 to 17.11 per cent. of alcohol.
Claret Chateau Latour 7.75 " " "
Claret Vin Ordinair.... 8.99 " " "
Champagne contains..11.30 to 13.80 " " "
Burgundy contains....12.16 to 16 60 " " "
Hermitage contains...12.32 to 17.43 " " "
Sauterne contains..... 14.22 " " "
Frontignau contains.. 12.79 " " "

GERMAN.

Hocheimer contains.....8.88 to 14.37 per cent. of alcohol.
Johannisberger contains. 8.71 " " "
Rudesheimer contains..5.90 to 12.92 " " "
Rhenish contains.....7.00 to 7.53 " " "

Manufactures in the United States.

The following statistics show the immense development that has taken place in the manufactures of the United States during the last decade. The total figures of the Union were, as appears from the following table, $4,302,453,616, as opposed to $1,885,861,676 for 1860, an increase of more than 230 per cent. Compared with the previous decade the result is astonishing, particularly when we remember the great number of men drawn from industrial occupations by the demands of war. There is no doubt but that it must be attributed in great part to the operation of the heavy tariff rendered necessary by the burden of the war debt. The value of manufactures per head is, however, as yet only about $117, showing that a great deal more remains to be done in the way of development.

The Pacific Coast States and Territories show a total of $105,552,454, of which California exhibite $73,116,756, being an increase of less than 6 per cent. on 1860. So that we have fallen very much behind the reet of the Union. In a future article we will examine into the causes of this. Oregon and Washington have kept pace with the rest of the Union, and as for Nevada, Idaho and Montana, their manufacturiug industry dates no farther back than 1860.

STATEMENT EXHIBITING THE TOTAL VALUE OF MANUFACTURING (GROSS PRODUCTION) AT THE CENSUSES OF 1850 AND 1860, AND APPROXIMATELY FOR CERTAIN STATES AT THE CENSUS OF 1870,

STATES AND TERRITOR'S.	1870.*	1860.	1850.

*—Approximate. †—About.

Mountain Ranges.—The *average hight of mountain range* in Switzerland does not begin to compare with Colorado, or for that matter with any Western Territory. The mean hight of the Alps is from 8,000 to 9,000 feet above the sea. The mean hight of the Rocky Monntains is from 10,000 to 12,000 feet. This is the mean hight of the immense continental sweep of the *Cordillera de la Sierra Madre.* It is probahle that the average hight in Colorado, which is the table land of the continent will approach very nearly to 12,000 feet.

Useful Information.

The Mississippi and Niagara Rivers.

It is well known to geologists that the upper lake regions, embrscing, Lakee Supsrior, Michigan and Eris, sre very old—thst they existed long before the Allegbeuy mountains were lifted above the occan. Ths samo may also hs said of the region through which ths upper St. Lawrence flows. Many millions of years is the length of time assigned, hy geological ovidencs, for the existence of the lake system, and yet those samo geologiste are agreed that two or three hundred thousaud years, at most, is the period that can be assigued for ths flow of the Niagara river, through which thoss lakee ars now drained.

How thsu are we to account for their draiuage through ths millions of years not registered in the chaunel of the Niagara?

Careful surveys bave shown that the Niagara, at the head of the rapids, *is only thirty feet higher* than tho waters of Lake Michigan; consequsutly a barrier, a little more than thirty fect high across tho Niagara platean, would throw the waters of Lakes Erie and Huron back into Lake Michigan. Othor surveys have shown that the waters of the Chicago river, where thsy reach lake Michigan, are but five or six fset higher thau ths waters of the nearest tributary of the Illinois river, which flows southward into the Mississippi. The Chicago river, in fact, has long been little better than a mere slongh, its waters almost etationary, and very filthy from staguation, so ruuch so, that, if we are correctly informed, its npper bed has recsutly been deepened, for sanitary rsasons, and a communication opened with the Illinois rivsr, so that ths waters of Lake Michigan are now actnally flowing both ways—eastward to the St. Lawrence and wsstward to the Mississippi.

An old river bed, of large dimensions, hae long heen known to exist, throngh which it is supposed all the waters of Lake Michigan formerly found their way iuto the Mississippi; while there is a plainly defiued barrier across the Niagara river, just ahove the rapids, which must, at sometime iu the past, have prevented the waters of the upper lakes from flowing eastward.

Further evidence that these suppositione are correct is found in the fact that the enormons exteut of flat country in Louisiana, Mississippi, etc., must have beeu made from the drift of an ancisnt river of much larger magnitude than the presont Mississippi. Thsre could have been no other source for such a flow of water except from tho region of country drainsd by the Great Lakes, which is fully eqnal, if not greater in extent, than ths area draiued by ths Missouri.

But what is stronger still, this mighty stream of early geologic age, once emptied its waters at a point some three or four hundred feet below its preseut level, as is fully shown by artesian borings, which bring up vegetable remaius and chips from huge trees from that distance below the existiug surface. It was by the migbty rush of ths waters of this huge river, laden with mud, sand, floating and tangled trees, etc., that the thonsands of square miles of ths best cotton and sngar land on the Continent have been mads all along the north weetern coast of ths Gulf of Mexico. It is eaid that unmistakable evidences of the oncs rough aud rugged bottom and shorss of this stream are still to be seen along some of the upper portions of the present bed of the Mississippi. The gradual subsideuce of the land near the Gulf must account for the apparent elevation of its waters from the level of their earlisr deposits.

Putting Grindstones in Order.

It is impossible for any one to grind a tool properly on a stone that wabbles like a drunken carriage-whesl. In order to grind the basil of a chisel or plane-iron true, the periphery of the grindstone must revolve as true as a millstone. Ths first step toward puttiug a etone in proper ordsr is to measure from ths centsr or ths eye to the periphery, on four sides, for ths purpoee of determining whether the stons has besn worn off more on one sids than on ths other. When a stonc is driven by a treadls, a large part of the grinding is done on one side of the etone when ths treadls is going down. In such a cass, the stone should be rshung with the journal nearer one side of the eye than the center of it. After it has bsen hung ae true ae practicable, screw down ths caps of the bearing-hoxes so that the journal will have no play; then, with ths end of an old fils turn a small groove near each edge of the periphery, after which drose off each side with a sharp, cold-chisel an inch or more from the grinding surface. Now fix a solid rest close to each sids of ths stone, turn a small groovs in each side of the stone, and dree off the prominent parts with a sharp cold-chissl. Always cut horizontally toward ths middle of ths stone from each side, and thus avoid eplitting away large chips from the side of the periphery. Always use a light hammer or mallst and a small half-iuch chisel. With a heavy hammer and large chissl, there will be great danger of chipping off a largs piece of the stone beyond the mark. With a light hammer and a emall, sharp chisel, one can fit up ths psriphery of a wabbling grindstone, in a brief space of time, so that it will rsvolve eatiefactorily true. *The Industrial Monthly.*

What Oils will Ignite Spontaneously.

Thst certain drying oils, as liussed, for example, abeorb oxygen, thsreby raising ths temperatnrs of the article on which they msy hs spread, is well known, or ought to he, and thie increase of temperature may be carried to the extent of causing combustion. That oiled rags, etc., do taks fire, and the firs is from them often commnnicated to woodwork, must be admitted. Hence, ths origin of certain fires that cannot be accounted for otherwise.

The recent hnrning of ths moueter balloon at Chelsea, Mass., is a cass of spoutaneons combustion, ths linseed oil and varnish with which it was coated taking fire by ths absorption of oxygen and raising the tsuperature to the extent of setting the cotton cloth, of which ths balloon was made, ou fire.

But thess drying oils are vegetable products, tho chief one used beiug the linseed referred to. It does not follow that animal or mineral oils will produce any such effect, for tbey are not drying oils and thsrefore absorhers of oxgsn. Yet the mistake is possibly made aud ths idea is certainly entsrtained that rags and sawdust eaturatsd with lubricating oils will take fire epontanoously. We do not nnderstand the matter. The fire at Faber's pencil factory in New York, lately, has hesn attributed to sawdust aatnrated with machinery oil, takiug fire spontaneonsly, but with how much reaeou.

Quite liksly the common mistake is mads that becauss csrtain things moistened with csrtain oils take fire, thsse same certain things will or may take fire if wet with *any* oils. Sone go so far ae to say that oil hsated by frictiou in machinery bearings if allowed to fall on cottou rags, waste, eawdust, and the like, will geuerate eufficient hsat to take fire, but of that we waut proof. It is an important matter, and it is to be hoped those who possses facilitiss will investigate the euhjsct furthsr.—*Cabinet Maker.*

The Nauuow Gauge Convention which recently mst in St. Lonis, was expected to he attendsd by svery manager of such an intersst iu the country, and to devslope certain facts concerning which many railroad men are now in doubt. The frieuds of the narrow gange eystem assert that their road can be built and equipped at a cost not exceeding one-half that of ths broad gauge; that they earn as much per mile as the latter; that they ars equally rapid in transporting and far more secure. So far thers doee not seem to be any question regarding ths practicability of narrow-gaugs for the husiness to which it has besu applied.

Grafting Wax.——A recipe for making grafting-wax, from a practical nurseryman of great experience; is—resin, six pounds; heeswax, one pound; tallow, ons pound; melt and work uutil cold. This is to be used warm, when working in the houss. For outdoor work, Mr. J. J. Thomas recommends ths sams formula, except using linssed oil, ons pint, in place of ths tallow. For outdoor work a good wax is made by using one to two pounds less of resin, one-half to one more pound of beeswax, and ons aud ons-half pints of linseed oil; to be nsited, made in a mass, and applied by hand.

Test for Japan.—Pour ont a fsw drope of Japan on a stone or a piece of glass, and add two or three drops of raw linseed oil. Stir the two together, and if the oil readily combines with the Japan, ths drysr is of a quality safe to bs ueed on carriags work. If the Japan repels the oil and the end of the etick becomes gummy, the Japan is worthlese. We hava the above from a varnish and Japan maksr of large experisnce.

Tan Color.—The beet way to make this ehads ie to get a pail of ground bark from the tannery; but if that can't bs done, make hemlock bark as fins ae possibls, soak or beat it until yon think the color is out; maks your goods as eoft as possible by washing thsm in strong soap suds, and immerss; if not dark enough, add mors bark. Don't color in iron, it will make drab; if you want drab, add a little copperas.

Mildew in Boat Sails.—A safs plan ie eaid to bs to dry the eaile thoroughly, in the opsn air if practicable, and to swesp them well on both sides with a etrong hair brush, having eprinklsd it bsforehand with water in which a little ammonia hae besn dissolved. Do not roll the sails up wst, as it is damp which has produced the mildew. To disinfect eails, or prevent infection, carbolic acid is good.

The tendeuoy of steam is to fly to the coldset place to impart its heat. If, for instancs, a ball of ice be suspsnded at the ceiling of a room, and some water thrown upon a hot etove in the room, the steam thus gsnerated will go continually to the ics until it ie melted. Thus ae an equalizer of heat eteam has no squal.

Engravino Extraordinary.—Clauds Mellen engraved in 1700, a full head of Christ with one unbroksn line. Thie lins commsnced at ths appex of ths nose, and wound out and ont like a watch-spring, until it snded in the bordsr of the picture.

Misery aseails riches, as lightning does the highest towere. Or ae a tree that is heavilyy laden with fruit breaks its own boughs, so do riches destroy the virtue of their poeeessor.

Good Health.

Increasing Longevity of Human Life.

A cotsmporary says that physiologists tell us that with a greater prevalsnce of knowlsdge of tho laws of health the world may expect an increass of ths average duration of human lifs. Psrhaps thie tims ie alrcady dawning. At any rate here are a fsw "health considsrations" for those above sixty. Vou Moltks, comparatively juvsnile at ssvsuty, plans and sxecntes such a campaign ae modern times never witnsssed; Emperor William, tough ae oak at seventy-four, roughe it on ths field as jauntily as a young lieuteaant. Von Roon, ths Prussian War Minieter, oldsr than either General or Emperor, directs from Berlin the marshaling of hosts and gathering of supplies.

Nor were these wonders of longevity by any means confined to the German side of the contest. Thisrs, at seventy-five, was seen at the end of the contest flitting with ths vivacity of a boy from one camp to the other, as a negotiator of peaco, and as the exscutive head of ths Frsnch Goverumeut has since shown a powsr of intellect and applieation to businees that would be cousidered woudsrful iu any man even iu the prime of lifs. Of his aseociates, Dufaure, the Minister of Justice, is seventy-three, and Gnizot, King Louis Philipps's ex-Minister, though past eighty, writes booke with as much force as when he occupisd a profsssor's chair. In Englaud, where men are rsckoned young till they are past fifty, splendid examplss of vigoroue old age ars plentiful. Palmerston, Lyndhurst and Brougham, octogsnarians all of them, led public opinion of Great Britain to the eud of their days, and in harness. It is said of the first of the three, that after a field-night in the Houss, hs would be ssen at daylight walking hoiue at a pace which a youug man might envy. Thoiuas Carlyle, over seventy, abates nothing of his intellsctnal vigor; while Lord John Russel, though crsspiug towards eighty, still attsnds the Upper Houes of Parliamsnt.

Mercury in the Human System.—A tablespoonful of quicksilver wae lately found in an old grave in York county Pennsylvania. It is snpposed to have been buried thsre in the shape of calomel within the patient.—*Ex.*

In old timee the doctore eometimee admiuistered pure mercury as a medicine; a mors common form of mercurial administration was the blus mase. Either of thess preecriptions would account for the preeence of quicksilver; but dosing with calomel would not.—*Scientific American.*

We have kuown globulss of mercury to bs abstracted from the systems of psrsons who had never taken it in any form but that of oalomel. Calomsl bsing a chlorids of mercury formed by heat and a pulverizing procees, the mercury can be prscipitated or reetored by the uee of acids. Why will not the acids of ths stomach, which will not act npon the msrcury itself, deprive it of its chloride vehicle and leave it pure. If the *American* does not bslieve that dosing with calomel will acconnt for the presence of quicksilvsr, it can be eatisfied of the fact by submitting a calomel doeed patient to an electric bath.—*Am. Manufacturer.*

Necessity of Carefulness in Old Age.—An old man ie like an old wagon; with light loading and careful ueage it will last for years; but ons heavy load or sudden strain will bteak it, and ruin it forevsr. So many psople rsach the age of fifty, sixty, or even esvsuty, measurably free from most of the pains and infirmities of age, cheery in hsart and eound in hsalth, rips in wisdom and expsrience, with eympathies mellowed by age, and with reasonable proepects and opportunities for continued ueefulness in the world for a considerable time. Let euch psrsons be thankful, but lst them also bs careful. An old constitution is like an old bone; broken with eass, msnded with difficulty. A young tree bends to the gale, an old one snape and falls before ths blast. A eingls hard lift; an hour of heating work; an svsning of exposure to rain or damp; a severe chill; an excess of food; ths unusual indulgencs of any appstite or passion; a sudden fit of anger; an improper dose of medicine;—any of these, or othsr similar things, may cnt off a valnable life in an hour, and lsavs the fair hopeeof usefulneseand enjoymsnt but a shapelsss wreck.

Druggino.—A writer in the London *Standard* described a "most succsssful mode of drugging in use over the American continsnt, which produces lose of strength and torpor, and which, in the case of death resulting, defies the most acute msdical analysis." He was himsslf once a victim to this drugging. Hs drank one mouthful of so-called brsndy, and in ten minutss aftsr he bscame giddy, lost the uss of his limbs, and thsn conciousness, and did not recovsr for some ssven hours euffieiently to enable him to walk. He subsequently got acquainted with a man who had been employed at a New York vault to snact the part of a drugger, and this respectabls, and no doubt reliable individual, explained ths drugging process. Part of a bottle of any liquid is decantsd aud the spacs filled up by tobacco smoke, expelled from a clay pipe, well impregnated with nicotins. The bottle is thsn wsll shaken and fillsd up again with the portion befors taksn out. It is then left to etand for a week or so; but if left etanding for a fortnight death will bs the reeult of drinking.

Physiolooical Action of Quinine.—Ths physiological action of quinins has lately been ths subject of detailed expsriment by Binz. who found it to havs extraordiuary powsr in arresting ths process of fermentation and putrefaction, and to be a powerful poisen for low orgauisms, or, in other words, for all moving bodies consisting of protoplasms. It appears to kill fungi and bacteria, which accompany fermsutation and putrsfsction, and pnts a stop to thess processes. It arrests ths motion of the whits blood corpuscles, and thus prsvsuts thom from making their exit from the blood-vessels. It therefors diminishes or arrests ths formation of pus in infismmation, pus consisting in great measurs of au accumulation of white corpuscles which hsvs issued from ths vessels. It also destroys the power of certain substances to prodnce ozone. The red blood corpuscles have thie power, and, by depriving them of it, qniuine, whsn prssent in the blood, must diminish the change of tissus iu the body, and thereby lssen ths production of heat.

It is also found that quinius lessens oxidation iu ths blood; other substances, such as snake poison, incrsasing it. When putrid fluids are injected into the circulation of an animal, its temperature rises; but if thsse ars prsviously mixed with quinine, this rise is arrested, or very much diminished. According to Zuntz, the uss of quinine has a marked influence upon the exersion of urea, the amonnt diminishing very greatly.—*Harper's Monthly*

Ancient Dentistry.—Among the ancients great euccees was obtaiucd in this art. Casselius was a dentist in ths reign of the Roman trumvirs, and gold was used in the filliug. But nearly 500 B. C. gold was thus used, aud gold wirs was employed to hold artificial testh in position, and it doee not seem to have bsen a nsw art. A fragment of the teuth of the Rouan tables, 450 B. C., has reference to prevsnting the burial of any gold with the dead except that bound around the teeth. Herodotus declarss that the Egyptians had a knowledgs of ths diseasss of testh and their treatment 2,000 B. C. In Martial, Cassslius is mentioned as sither filling or extracting testh, but he specified that hs would not polieh falsetseth with powder. Theee facts cover a psriod of 600 ysars.

Fatigue.—In order to uuderstand, says Leibig, the influence of an irregular expenditure of force, we need only to remember that when greatly fatigued we lose our appetits, and that when the stomach is in full activity the limbs are indisposed for performing hard work. Insufficient nourishment and fatiguing work, during the period of growth, stop the corporeal development of the individual. Ths amount of daily exercise necessary for health depsnds upon the kind of sxerciee, and varies considerably with diffsrsnt persons and with ths eame pereons at different times. A safe rule to go by ie to sxercise nntil slightly fatigued. It should not be continued so long that half an hour of psrfect rest will not entirsly remove all feeling of fatigus.

Morbin Fears.—The fixed idea of having heart-disease is a very common one. We know an Indian officer who indulged in it for twenty years, to the great annoyancs and tsrror of his wife and his friends, and who died at a good old age, with a perfsctly "sound heart," phyeically spsaking: By auscultation, doctors eari very eaeily tell you whsther ths hsart ie right, jnst as you can hear whethsr a clock is right as to its tiokings and beatings. Thsre are othsr very eure symptoms wsll known to the profeesion. Many persons also fear they have cancsr in the stomach or liver; or a taps worm, or some other dreadful malady; but gensrally thsse feare are the result of a disordered imagination, and groundlsss.—*Herald of Health.*

Micrococci in Measles and Scarlet Fever.—Dr. Hallier, well known by his researches upon the fungi as supposed agents or concomitants of disease, states in a recent papsr that measles and scarlet fever are both occasioned by the presencs of csrtain fungi in the blood, which can be seen hy the microscops in the form of minuts csll-liks sporss, called micrococcus. In ths course of treatmsnt of persons affected with the abovs diesases care was taksn to collsct the psrspiration obtained from ths patients undsr these circumstances, whioh, on bsing submitted to Dr. Hallier for examination, was found to contain the micrococcus in abundancs.

Toothache.—A correspondsnt of the *English Magazine* gives ths following curioue rsmedy: Put a pisce of quick-lime as big as a walnut in a pint of water, in a bottls. Clean ths tseth with it, evsry morning, rinsing the mouth with clean water afterwarde. If ths teeth are good, it will pressrve thsm and ksep away toothache; if the teeth are gone, it will hardsn ths gums, so that they will masticate crusts and all.

In India, whers stinging inssets and several crawling reptiles are often wounding people, they apply chloroform on lint, which spesdily allaye irritation and psrhaps nsutralizee the poison. Why not try it hsre.

Oil of Peppermint.—A writer in the *American Journal of Pharmacy* asssrts that commercial oil of psppermint is adulterated to the extsnt of thirty to forty per cent., with caetor oil and alcohol.

Take Care of Your Health.—A man too busy to take care of hie health is like a mechanic too busy to take care of hie tools.

MINING AND SCIENTIFIC PRESS.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY, W. B. EWER, GEO. H. STRONG, JNO. L. BOONE.

Office, No. 338 Montgomery St., S. E. Corner of California St., diagonally across from Wells, Fargo & Co.'s.

SUBSCRIPTION AND ADVERTISING RATES.

ADVERTISING RATES.—1 *week.*	1 *month.*	3 *months.*	1 *year.*
Per line..... .25	.80	$2.00	$5.00
One-half inch.....$1.00	$3.00	7.50	20.00
One inch..... 2.00	5.00	14.00	38.00

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper, inserted at special rates.

SUBSCRIPTIONS payable in advance—For one year, $4; six months, $2.50; three months, $1.25. Clubs of ten names or more, $3 each per annum. $5, in advance, will pay for 1½ year. Remittances by registered letters or P. O. orders at our risk.

English and Colonial subscriptions, post paid, per year, £1 3s.; 6 months, 12s. Advertisements, per line, first insertion, 1s.; subsequent insertions, each, 6d. Large advertisements at special rates.

ILLUSTRATIONS AND REPORTS OF MINING ENTERPRISES WANTED.—Drawings or photographs of mining works that are of general interest to our readers are solicited for publication in this journal. Official reports of Companies, and description of mines of importance, of special interest, are also desired. Sketches of any new method and discoveries will be very acceptable.

San Francisco:

Saturday Morning, July 20, 1872.

Gold and Legal Tender Rates.

SAN FRANCISCO, Thursday, July 18, 1872.—Legal Tenders buying, 88; selling, 88½. Gold in New York to-day, 114¼.

Table of Contents.

ILLUSTRATIONS.—Mountain Chain, Upper Burmah; Combined Pencil Sharpener, Holder and Twine Cutter, Page 38. Melendy's Patent Door Fastener, 41.

EDITORIALS.—Copper; Mills Destroyed, 40. Home Industries; Academy of Science, 41.

MINING SUMMARY.—Reports from mines in various States, Counties and Districts; Stock Reports; Markets, 36-7. Mining Shareholders' Directory, 44.

CORRESPONDENCE.—Notes of Travel in Lander and Elko Counties, Nevada; The "Alpine Miner" and "Metallurgist", 34.

SCIENTIFIC PROGRESS.—The Nature of Comets; Nature of the Action in Galvanic Batteries; New and Powerful Thermo-Battery, 35.

MECHANICAL PROGRESS.—Economy in Blast Furnaces; Counterpoise; Power of a Locomotive; The Future of American Iron; Stone Turning Apparatus; Improved Economy in Iron Manufacture; Liquid Fuel; Hoop Iron; Iron Mountain Ore, 35.

USEFUL INFORMATION.—The Mississippi and Niagara Rivers; Putting Grindstones in Order; What Oils will Ignite Spontaneously; Grafting Wax; Test for Japan; Tan Color; Mildew in Boat Sails; Engraving Extraordinary, 39.

GOOD HEALTH.—Increasing Longevity of Human Life; Mercury in the Human System; Necessity of Carefulness in Old Age; Drugging; Physiological Action of Quinine; Ancient Dentistry; Fatigue, Morbid Fears; Micrococci in Measles; Toothache; Oil of Peppermint, 39.

DOMESTIC ECONOMY.—Whitewashing; Tomato Sauce; Dried Figs as Food; Summer Drinks; Practical Receipts, 44.

MISCELLANEOUS.—Mines in Amador County; Rich Strike; Blatchley's Drills, 34. Coal; Glass Works; Placers in Santa Barbara; Original Amador Mine and Mill; Alcohol in Wines; Manufacture in the United States; Mountain Ranges, 38. The Next Ore Strike; Antimony, 42. Notices to Correspondents, 40. New Mining Incorporations, 41. New Incorporations; Meetings and Elections; Mining Sales, 44.

Notices to Correspondents.

A correspondent writing from Petersburg, Klamath county, asks us how geologists account for the deposits of red clayey matter so often found over the gravel channels throughout the State.

A glance at the location of the questioner's post office makes a good deal of difference in the way his question is to be answered. Red clayey deposits do not usually overlie the gravels in other portions of the State. Where reddish volcanic matter does, there may be a covering of decomposed lava—not a clay properly. On the slopes of the Sierra Nevada, red clays in association with gravel are to be accounted for like any other clays or gravels. But if red clays usually overlie gravels in Klamath county, the next question to be ascertained is, are they continuous to any distance in horizontal layers or are they only local or cuticular in character? In Weaverville basin, for example, the clays are continuous and are accounted for as a lake or subaqueous deposit. Will R. T. please inform the readers of the MINING AND SCIENTIFIC PRESS in regard to this point touching other Klamath gravels?

The New Mining Law.

With regard to the numerous queries concerning interpretations of the new mining law, we propose answering them all by publishing Commissioner Drummond's circular, which we have just received from Mr. Sargent. It gives the regulations under the new law, and contains full instructions, for registers, receivers and surveyors-general and will be of great interest to all miners. We will begin the publication of this document in next week's issue and continue it till finished.

Copper.

Copper mining has not for a long time been a very profitable business on this Coast, owing to want of facility for working the ores, high cost of transportation, high price of labor as compared with other copper-producing regions, and the fact that the importations of the metal from England and Chili are too large, and the rates too low, to admit of successful competition. It has not been the fault of the mines, for, generally speaking, the deposits are large and carry a good percentage of metal.

The advanced price of copper within the past few months, has induced some of the owners of the numerous mines on this Coast to again turn their attention to their long neglected properties, and we hear of copper mines being re-opened all over the Coast. The comparatively small lots of ore which have been extracted on this Coast for the past few years, which have not been shipped, have been disposed of to the manufacturers of blue-stone in this city, but the demand from that quarter is of course limited. The business of shipping copper ore to England was for a long time very profitable, and immense quantities were thus disposed of, almost every vessel that left carrying away a number of tons. Up to the last few years the principal shipper went from here from 15,000 to 20,000 tons per year, principally to England, but some to Boston and Baltimore. When the price of copper fell, which it did suddenly while large quantities were on shipboard, the disastrous consequences it brought upon many operators here and the long continued low prices for the product, brought copper mining on this Coast almost to a standstill.

The Copper Mines on this Coast.

The rise in the price of copper recently has now, however, caused a general revival of work in the mines of that metal and all the old dumps are being picked over for shipping ore, and some of the mines being re-opened. The Union mine at Copperopolis will shortly resume operations, and the engines are probably by this time pumping out the mine. When this is completed a large force of men will be put at work. The Newton at Copperopolis will also also shortly be producing ore. The English Company's mines at Battle Mountain, Nevada, have been producing from 20 to 30 per cent. ore for the past two or three years, which has been shipped to Liverpool. Good ore is coming out of the Globe mine, in Alpine county, Cal., and the Leviathan in the same county will probably be worked as soon as negotiations concerning its sale are completed. There are numerous ledges in Elko county, Nevada, that are being re-opened. Those near Reno which were worked some years ago will probably be opened again if the state of the market warrants it. The southern portion of the State, particularly Los Angeles county, abounds in copper ore, and Catalina Island off San Pedro, which was recently sold to capitalists for $1,250,000, contains some of the most valuable copper deposits on this Coast. The Ella mine, Elko, Nevada, has commenced work again, and begun to ship ore to this city. They have a large ledge assaying from 25 to 33 per cent. They had proposed last month to ship about 75 tons per week, but the rise in the price of freight on the railroad has interfered with their plans. We might mention hundreds of other mines and localities but the few enumerated will show that a general activity is beginning to prevail.

Other Copper Regions.

The Lake Superior copper region has never been in as prosperous a condition as most people suppose and the mines have, many of them, become idle. The local papers in that district say "that concerning the past history of this important industry the less said the better." They are now, however, like ourselves, hopeful of a change which can only be beneficial. They have had much trouble from want of proper management, lack of facility for transportation, too much stock gambling, etc., and cite many instances which find a parallel in the history of mining on this coast. The copper mines of Chili which have been producing the majority of the supply of the world for some years and which almost monopolized the business, are now beginning to evince signs of exhaustion. In that country labor was extremely cheap, the deposits very large and the mines easily worked. The ores are not now so good as they were nearer the surface and contain more iron, rendering reduction more expensive. The cost of mining is of course increased as depth is attained and the yield is falling off. The number of railroads being built there is also inducing the laborers to leave the mines since they can get better wages. The mines in Peru are no longer profitable it is said, so that the supply has decreased from that source. The English mines are not now producing anything like they have done in former years, the figures showing a great falling off. Australia, or rather the Colony of South Australia, is a famous copper producing region, the Burra Burra being the principal mine. England at present takes all the product from this quarter.

Freight by Rail.

During the month of May, the shipments of copper ore over the line of the Central Pacific Railroad were rapidly increasing, and the miners were satisfied with the results from their ore; but since that time the railroad company have seen fit to advance the rates of freight $4 or $5 per ton. This action has nearly put a stop to all kinds of low grade ores coming to this market, as rates of freight will not justify parties in shipping anything under 16 or 18 per cent. ore at any great distance from this city. The company make no distinction in regard to quality or quantity, 20 per cent. and 40 per cent. costing the same, whether one ton or one hundred. Ores shipped from Ogden or Salt Lake are delivered here nearly as cheap as they are one-half the distance on the same road; so the location of the mine makes little difference as to freight. Moreover, they will not take into consideration the fact that the shippers dispose of their ore, and make their calculations on 2,352 pounds as a ton of copper ore, but charge the same as for silver ores which sell by the ton of 2,000 pounds. This is of course an important item where any large amount is shipped.

Shippers say that if the railroad company would look at the net returns from the ores, they would see that their rates are too high to make copper mining for anything under 20 or 25 per cent. ores profitable. But they say that they cannot afford to bring them for less, so the only alternative is for the miners not to ship. Three years ago copper was not high enough to make it worth while to mine for it in many localities, and up to this month the railroad company has charged, from Elko, for instance $11 per ton. This month when 20 per cent. copper ores may be disposed of here at 3.25 per unit; 25 per cent. $3.10 per unit; and 30 per cent. ore at $3.25 per unit, the company charge $15 per ton. It seems strange that they could afford to bring it here from that locality for, $11 when it was low and now the markets are higher they cannot bring it for less than $15 per ton. A fraction of a ton is charged double rates,—$30 per ton. Such a policy on the part of the company is a questionable one for themselves for it only serves to prohibit the working of a number of mines which would otherwise make regular shipments by their line, there being no other. It is but natural to suppose that the rates of freight will continue to be in proportion to the rise or fall of the market, if the former conduct of the company may be taken as a criterion. The copper mines on the Colorado river can be made more profitable on low grade ores than those on the line of the railroads, since they can ship their ores here by sea. As far as the

Future of Copper Mining

On this Coast is concerned, the rates of freight by sea are reduced from their present price, and matters can be arranged with the railroad company in a satisfactory manner there is little doubt but that it can be made very profitable. The general impression is, that the price of copper will be high for some time, but whether it will result in any ultimate profit to holders of mining properties on this Coast remains to be seen. If the railroad company persist in raising their rates in proportion to the price of copper, then the profit will find its way into the coffers of that incorporation rather than into the pockets of the mine owners; so unless some reduction in freight occurs, the holders of low grade mines will not be benefitted to any great extent.

Freight to England is very high, and ships scarce. For cargoes of ore the same price is charged as for wheat, about $19 or $20 per ton. Ores in small quantity can occasionally be shipped for less, but at present as there is considerable offering, a full rate will have to be paid. Of course 40 per cent. and 20 per cent. ore cost the same for shipping, so high grades are preferred.

There is no other reason why we cannot make money out of the mines of this coast than the high price of freight. A great change has come over the business of mining generally, since the majority of these mines were worked, and it has come to be looked upon more as a business than a venture. Extravagance has been checked, more experienced superintendents employed, and the fact that mining has its definite business restrictions is now recognized. The "ring," which is said to exist in New York, will, no doubt, keep up the price for some time. The reports concerning it, are, however, contradictory; some saying that it has bought up all the copper in the market; others saying it has contracted for the product of all the principal mines in the United States in a certain period. It is understood that this ring has contracted, at a stipulated price, for the product of the prominent Lake Superior mines for a certain length of time (reported all the way from six to twelve months). We have not heard of any contracts having been made with any of the Pacific coast mines.

Consumption and Supply of Copper.

The consumption of copper is, it is said, increasing the world over, while the supply is not increasing, or rather it is falling off. This enlarged consumption is due to the unusually large amount of copper and brass used in the construction of locomotives, cars, etc., the manufacture of ornamental hardware, increased amount of copper pipe and pans for use in sugar refineries, distilleries, etc., large amount of metallic cartridges manufactured, the manufacture of soldering irons used in the large trade in canned goods, etc. The consumption in this country last year, which averaged over 1,320 tons per month, exceeded the supply by more than 2,350 tons during the year, showing a great increase in consumption, since it was, until the first of this year, supposed to be, as it had been for some years past, about 1,000 tons per month. The total production of the United States in 1871, was 13,500 tons, and the total consumption 15,850 tons. Chili, which exported about 52,000 tons in 1870, only sent 42,400 tons in 1871. The English mines yielded last year, it is said, only 6,500 tons. The probabilities are that the price of copper will not fall very much for some time, the influence of the tariff, the firmness of the metal market, the "ring," etc., combining to keep it up. It is to be hoped that those who are interested in this branch of mining will turn their attention to the economical working of their mines, a judicious selection of their ore, and try to induce the omnipotent railroad company to reduce rates of freight, and doubtless this long neglected branch of industry may be made once more profitable.

Mills Destroyed.

Both of the south boilers of the Petaluma mill, Gold Hill, exploded on the morning of the 15th inst., entirely destroying the mill. The Gold Hill *News* says that the boilers being connected, exploded simultaneously, the steam drum divided in the middle, one portion flying over the Sapphire mill and coming down through the roof of the Sapphire saloon, 80 yards distant, and the other half went in the opposite direction, smashing in the side of a building 200 yards distant. A large portion of one boiler was thrown over the roof of the Sapphire mill into the street. A piece of furnace front, weighing half a ton, flew into a saloon 60 yards distant. The boiler tubes flew in all directions, and several narrow escapes are mentioned. There was plenty of water in the boilers, according to the engineer's account and the gauge only showed 95 pounds of steam. It is said that the boilers were old and worn out, and have not been considered safe for the last year or so.

By this explosion, three people were killed, and several wounded. The killed were John N. Tucker, the blacksmith at the mill, John Giannini, an amalgamator, and Daniel McKenzie. James Garvey, an amalgamator, Frank Edmonds, the engineer, a fireman named Kimball, John Mullen, Frank Silva, and Frank Scales were injured. The mill was owned by Fair & MacKay, and Jones & Hayward.

Parker and Bowie's Tailings mill, in Seven Mile cañon, just below the site of the old Gould and Curry mill, was totally destroyed by fire on the morning of the 14th inst. It was built of pine, and burnt, of course, like tinder. The owners had just finished putting in a large new boiler, seven new pans, an improved 10-ton settler, etc., none of which had yet been used. The origin of the fire is unknown. The mill and improvements was valued at $100,000, and was insured for $30,000. The fire throws about 100 men out of employment. They intend putting up a fine new mill in the place of the one destroyed, and hope to have it done in six weeks.

Home Industries.

Brass and Bell Feuadiag and Finishing.

Long before iron came into use, brass and mixed metals occupied the same place in the economy of msnkind, thst iron does now. the brass founder'a trade is consequently the oldost trado in the world. And though it has sunk to a subordinato position in the great industrial array, tho infinitude of uses to which brass castings are applied, has helped to build up a vast business in it, all over the world. It has been followed long in San Francisco; the proprietors of

Garratt's Foundry

Having entered into the business in 1850, two years subsequent to tho discovery of the vast auriferous resonrces of this State. In that year, the first small establishment of the kiud, employing three men, was started iu Portsmouth Square. It was subsequently removed to Leidersdorf street, thou to Market, tben to the corner of Fromont and Mission, aud lastly to its present location on Fremont betwcen Mission and Howard. It has been burned out no less than throo timca; first, in the great May fire of 1851, whon tho proprictors lost all, and lsstly in the great firo ou Mission street, when a loss of $80,000 was sustained. But the indomitable energy of the owners surmounted all difficulties, aud uow their establishment is ono of tbe finest indnstrial ones in the city. It is two stories high, built of solid brick, aud covers a space of 75x137½. It is divided into storeroom, machine shop, and foundry, on the first story, aud tho finishing room and pattern shops on the second. A cellar uuderneath the machino shop, is filled witb tons on tons of old copper aud copper mixtures, tea-lead, tin etc., obtained from a thousand different sources. Tho number and variety of the machines used is truly surprisiug; pssing througb the establishment everywhere they meet the eye. The great number of the srticles msuufactured, renders necessary tbe employment of a vast number of tools. The work carried on is tbat of casting and finishing steam, gas, mschine, instruments, and wster-fittiugs, engineer's findings, and bell founding. The latter is s speciality, there being no other bell foundry on the coast. Tbey found church, school, steam, farm, aud plantation bells of all sizes, and from 5 lbs. up to 2,000 lbs. in weight. The first bell ever cast on the coast, was by them, cast in 1851, for the steamer Webber. They melt an average of 700 lbs. of metal per day, or about 250,000 lbs. a year; of this, ¼ is copper. They have eigbt furnaces which possess a melting capscity of about 1,600 lbs. per day, but only about half of tbese are generally at work. They employ sixty men and boys, and do an annual trade of at least $150,000. Of

Ths Other Foundries,

Greenberg's on Fremont street, between Howard and Folsom, employs at present, ten men, and snpplies a lsrge amount of unfinished castings to the trade generally. Its specialty lies in the msnufacture of steam, engineer's and boiler fittings, steamboat and brewery work. It has been established since 1853. It melts about 300 lbs. of metal per day.

Weed & Kingwell, First street, are constantly employed in the manufacture of plumbers' work, for tho hardware stores, and in that of N. Siebbert's Eurcka lubricators. They have thirty men at work, and are constantly busy. Of the lubricators they made last year 250, which, selling at at from $30 to $40 each, made this item alone, of the value of about $9,000. They melt 100 lbs. of metal per day.

Dobrzensky, on Mission street, has a specialty in the manufacture of gas machines, meters, and fixings. He also is busily employed, running 30 men. A great part of the work of the Metropolitan Gas Co. is done here, but the City Gas Co. prefer to import from tbe East.

The Metals

Used iu the business are copper, tin, zinc, lead, antimony and bismuth mixed in hundreds of different proportions, according as the work for which they are destined is used in air, water, etc. The same article requires different mixtures of metal in the preparation of its mountings, according to the locatiou aud temperature. Much of the copper is mined in California and sent to New York to be refined, and then comes bsck to the brass foundry, suggesting the necessity of having reduction and refining works established in the State. Owing to the rise in its price throughout America generally, an impetus bas been given to to copper mining on this coast, both at Copperopolis and Crescent City. All the other metals, save tho lead in a small proportion, are foreign. The

Melting

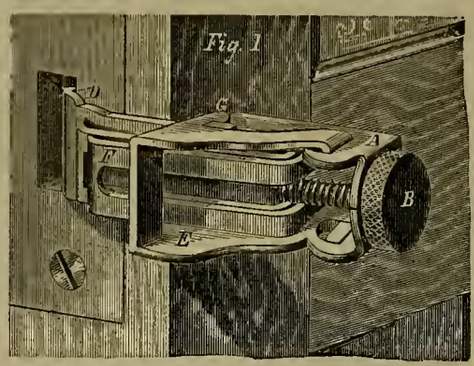
Is performed in crucibles contaiuing about 100 pounds each, for small qnantities, and cupel having a capacity of 1,500 pounds each for large ones. Tho copper reqniring the greatest heat, is melted first, and theu tho other metals are added, those requiring the greatest temperature being put iu first. The melted copper dissolves them almost instantly.

Synopsis.

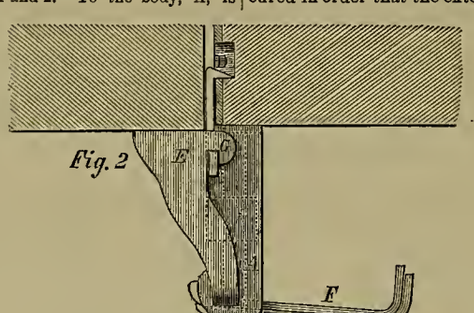
This city hoasts four brass foundries and finishing establishments, employing 130 mechanics and hoys, the former being paid at an avorago of $3 per day, and melting 1,350 pounds of metal daily. Tho valuo of the manufacturo is ovor $300,000 yearly, and employs a capital invested of about $110,000.

Melendy's Door Fastener.

This littlo devico seems to us to meet the requirements of a good door fastener more fully than anytbing of tho kind wo have met with. It is very cheaply made, and holds the door to



wbicb it is applied very securely, without marring the casement. It consists of a body, A, Figs. 1 and 2, of strong sheet metal, which carries a strong adjusting screw, B. Tbe screw plays in a nnt C, shown in dotted outlines in Fig. 2, and formed on the end of the strong claw, D, Figs. 1 and 2. To the body, A, is



MELENDY'S PATENT DOOR FASTENER.

loosely pivoted the bracket E, Figs. 1 and 2. The parts lettered F, are called compensators. and their use will be subsequently described.

Now to fasten the door, the claw is placed in the mortise of the bolt plate of the lock, as shown in both figures, the pivoted bracket being turned back, so that the door will pass it in closing. Then the door being closed, as shown in section in Fig. 2, the bracket is turned down into the position shown, slipped back on its pivots so that the hook G engages lugs formed on the body A, and the screw is then turned until tbe bracket abuts firmly against the door, as shown in Fig 2.

The compensators, F, wheu not ucded, are slipped back as shown in Fig. 2; but when the crack between the edges of the door and the casing is too wide to hold the claw firmly, one or both of them are placed in position, as shown in Fig. 1, so as to fill up the space and press and hold the claw firmly into the mortise of the bolt plate when the door is closed.

When a door is uuprovided with a lock, the claw may be made to engage the wood or a crack in the joining of the casemont, iu which last case the casement will not be defaced. It is small and convenient for travelers to carry in the pocket.

Patented March 12, 1872, by B. H. Meleudy, whom address, for further information, box 125, Amherst, N. H.

Academy of Sciences.

The regnlar semi-monthly meeting of the California Academy of Sciences was held on the 15th inst.

Donatiens.

A large number of very valuable donations were received, among which were a nnmber of pampblets, one of which on geology, etc., by Dr. L. W. Schaufuss, of Dresden, which contained a handsome compliment to Samuel Brannan, Jr., a member of the Academy, for his energy in collecting specimens, etc., saying that he had beon more thau three years in California and had collected many interesting specimous and bronght together much valuable material. A number of papers, translatod from theso pamphlets by Dr. Stout, were read by the Secretary.

Dr. Kellogg presented a large collection of botauical and conchological specimens, principally the former, among them quite a nnmber of new ones. They amonnted to abont a wagon load in bulk. Among the collection were a number of lichens and mounted mosses. Dr. Stout remarked that this single donation almost amonnted to a distinct collection, and suggested that enlarged accommodations shonld be procured in order that the extensive collection of the flora and fauna of California, which belonged to the Academy, could be made available for oxamination. W. J. Fisher presented to the Academy twenty-seven specimens of shells from the Samoa, Fiji and Sandwich Islands. John Williamson, Secretary of the California Acclimatization Society, presented a specimen of the rock-bass *(Centrarchus Aeneas)* from New York. A quantity of these fish had been sent here from Seth Green, the famous pisciculturist, a large number of which had died on the way. They have some living, however, in the Sooiety's ponds at San Pedro Point.

Our Iron Resources.

Dr. Stout said that an erroneous impression had gone forth that the Academy was not practical; that they talked about plants, bugs, etc., but gave the people no practical ideas. He said that idea was entirely wrong and that he had an important matter to bring before the geueral public which alone would prove that its object was more than mere discussion, etc. An item, called "Our English View of Our Shipping Trade" was then read, which answered as a preface to the Doctor's remarks. He said that one of the most important things for this State to foster was her iron interests and manufactures. An enormous price is now paid for imported iron while there were vast fields of it lying idle at our very doors. He knew of a place within 50 miles of San Francisco at which magnetic iron could be procnred by the thonsands of tons. A flask of this iron was exhibited in small grains just as it came from the bed. It assays about 73 per cent. of pure iron of the best qnality. One cnbio inch carefnlly measured, weighed one and a half ounces.

Whers this Mass of Irea Comes From

Is an interesting one. Is it a volcanic emanation from the bottom of the sea? Is it a crystallization? Dr. Stout's theory of the formation of this iron sand was that it came from tho bottom of the sea in the form of vapor, probably from a volcanic origin, and became condensed in the form of crystals by contact with the cold water. It has been proved by spectrum analysis that iron in the form of vapor exists in all places in the world's atmosphere, and the Doctor believed that the condensation of these vapors account for meteoric iron. This deposit of iron was extensive and available, and if the proper persons, with capital, took hold of it, it would be of great benefit to the State. He said this suggestion was practical, and the public cannot find fault with the Academy for not calling attention to it.

Dr. Stout's remarks canscd an interesting discussion among the members, which, unfortunately we have not space to give this week, but will publish in our next issue.

New Mining Incorporations.

We give below a tabular statement which we have preparod, of the number, capitsl, location snd shares of the uew mining incorporations which were organized duriug tbe first six months of this year. Of these, 14 were formed in January, 8 in February, 31 in March, 64 in April, 69 in May and 15 in June. The totsl number is 201, embracing a cspital (on paper) of $558,000,000, divided into 4,815,950 shares. It will be observed tbat of this number 126, or nesrly two thirds are located in Nevada, representiug over two thirds of the cspital stock. Much tbe lsrgest part of this immense sggregste may no doubt be attributed to tbe receut stock excitement in this city. What influence tbis lsrge increase of *stock* may have upon legitimate mining, it is difficult to say; but the accompanying table cannot fail to be very suggestive of the great and general interest which is being tsken by the community in the great leading industry of the Pacific Coast.

DOMESTIC ECONOMY.

Whitewashing.

So simple a thing as preparing a wash and putting it on walls and fences may not seem worth notice, yet we all know that the "Women folks" complain about bad work in whitewashing, and "men folks" as a rule, think the matter so simple that they do not care to know whether there is science or "coarse hand" work done to produce a nice job of whitewashing. Now we advise all men who have at any time come across these troubles to cut from this column the following process, and when next they are called upon to attend to any whitewashing, to observe it carefully. They will find a great burthen lifted from their minds from a trifling cause, and in a trifling operation, if they conform to a scientific instead of a blundering method of

Doing Whitewashing.

The best whitewash contains no quicklime at all, but is made of pure whiting, which is a soft kind of chalk, ground very fine, washed so as to separate all the coarse and gritty particles, and formed into lumps in the process of drying. Good whiting, beaten up with water so as to form a milky liquid free from lumps, and mixed with a little good strong size, forms a whitewash that cannot be rubbed off, and will give a very brilliant white surface. This is substantially the material known as Kalsomine, something old but never appreciated until it received a high sounding name. The whiting used to make this whitewash or kalsomine, is sometimes called Spanish white, Paris white, etc., etc. They are all the same thing, and the only point is to select the finest and whitest material offered to you, and take it under any name the vendor chooses to sell it, provided he does not ask too much for it, for it is only whiting after all. Some receipts name Sulphate of Baryta, a beautiful white powder, as the only material for making kalsomine. It answers very well, but is not easily procured, and more than half the time common whiting is sold for it. The size for mixing with the whiting is most easily prepared from glue, and as it is necessary that the whitewash should be permanent and as little liable to decay as possible, we must select a good article of glue. Directions upon this point could not be easily followed by housekeepers; let us therefore advise them to go to a respectable dealer and buy the best. Professional artists in the science of kalsomining, generally use the cheapest, and most recipes direct the use of a cheap article, but it will be found that it is most judicious to use the very best. The better the glue is, the less liable is it to decay in damp weather, and thus create disease. Moreover, when it is good, less of it is required, and the less glue you use, the purer will be the color of your kalsomine. To prepare the glue, soak it in water over night—not any longer, however, or it will begin to decay. It will absorb water and swell up, but will not dissolve. Pour the water off, add a little fresh, and boil until it forms a thin fluid. Beware of burning it, and to avoid this, the glue is best melted in a tin pail, set in an iron pot which contains some water. The whiting having been mixed with boiling water, as previously directed, the melted glue is added, and the whole diluted with hot water until it is of the consistency of ordinary whitewash. A quarter of a pound of good glue to eight pounds of whiting, is a very good proportion. It should be applied while hot, with a common whitewash brush. Owing to the fact that in damp places glue easily decays and produces poisonous vapors, kalsomine should not be used in damp basements or cellars. Any color may be given to this material, and in Europe many houses have the walls finished with light shades of pink, blue, green, etc., instead of paper, and the effect is very pleasing.

When walls have been previously covered with successive coats of common whitewash it will be necessary either to remove this or "kill" the lime. After taking off all that will come away by scraping and washing, the wall should be washed with a solution of vitrol—two ounces dissolved in a pail of water. This will "kill" the lime; in other words the white vitrol will be decomposed, and the wall be coated with plaster of Paris and white zinc, to which the kalsomine will adhere very readily. If these precautions be not taken, the kalsomine will very probably peel off.—*Manufacturer.*

TOMATO SAUCE.—The Melbourne *Leader* gives the following recipe:

Take forty pounds of tomatoes, wipe clean, and boil or bake till soft; then squeeze through a sieve that will retain the seeds and skins. Boil for an hour in order to get rid of some of the watery portion, and then add half a gallon of best brown vinegar, 1½ lbs. salt, 2 oz. cloves, 3 oz. allspice, 2 oz. cayenne pepper, 3 lb. white sugar, 4 oz. garlic and 2 oz. black pepper. Boil a sufficient time; two hours will usually suffice, but the sauce will not be boiled enough until it has become tolerably thick, and all the watery appearance has gone. Bottle without straining into perfectly dry bottles, and cork them securely when cold. The garlic must be peeled, bruised and tied up in a bag; all the spice must be ground; the quantities may be increased or diminished according to taste. We have kept sauce made from this receipt three years.

Dried Figs to Substitute Bread.

Chemists who have given the matter consideration are agreed as to the high nutritious quality of figs.

The richness of the fruit in saccharine matter offers a material equal to the starch of wheaten bread in a directly soluble form, which is more congenial to the human system. On the other hand, the oily and nitrogenous compound in the dry fig do not rank nearly so high as in wheaten bread. But these deficiences of gluten (and oil), so essential agents to nutrition may be easily made up by meat; and by calling on the animal kingdom for more fat and nitrogenous food may get the greatest benefits from the fig family.

The great facility which the climate of California affords for raising this nutritious fruit should encourage its more general use here. The people of every climate should accustom themselves to the more general use of such fruits as are suited best to such climates. The testimony of science, and the history and customs of many nations, both ancient and modern, teach us the economic and health giving nature of the fig as food.

In the Bible, figs are mentioned as amongst the food of man, and the tree, by its abundant yield of fruit and its protecting shade, whilst giving place to many a beautiful simile, is also made the emblem of domestic felicity. In one passage we have figs mentioned as provision in war, and a famishing Egyptian in the routed Edomite camp was nourished and invigorated by the fig-cake and raisins given him by the Israelitee. As there can be no doubt of the Israelites having an eye to the portability, as well as the nutritiousness of the life-sustaining provisions they carried with them in the war, the fact of dry figs and raisins having been amongst their most valued supplies would proclaim such fruits well worthy of our serious attention.

Nor have we many difficulties in the way. Nature has highly developed the fig tree in California, and thus gives us a broad hint of what we might do by way of more thoroughly economizing its product; the fig is already grown extensively, but not as it deserves to be.

The fig-tree with us requires but little culture, and an acre or so devoted to it on any farm would certainly prove a great acquisition of comfort, and a saving of money.

The fig-tree is long-lived, specimens some hundreds of years of age being known even in Britain. It claims naturally drained land, hill sides, or artificial drainage as a leading feature of its sucessful establishment. For home consumption the fruit may be sun or stove dried, and when dry may be packed and pressed away in boxes or barrels.

Summer Drinks.

Ice water should be drank but sparingly. A most excellent substitute for it is pounded ice taken in small lumps into the mouth and allowed to dissolve upon the tongue. This will prove very refreshing and much more enduring in its effects.

Lemonade is a simple and grateful beverage. To make it: Roll the lemons on something hard until they become soft; grate off the rinds, cut the lemons into slices and squeeze them in a pitcher (a new clothes-pin will answer for a squeezer in lieu of something better;) pour on the required quantity of water, and sweeten according to taste. The grated rinds, for the sake of the aroma, should be added too. After mixing thoroughly, set the pitcher aside for half an hour; then strain the liquor through a jelly strainer, and put in the ice.

Travelers who find it inconvenient to use lemons can carry a box of lemon sugar prepared from citric acid and sugar, a little of which in a glass of ice-water will furnish quite a refreshing drink, and one that will help oftentimes to avert sick-headache and biliousness. Citric acid is obtained from the juice of lemons and limes.

Perry is a delicious beverage made from cherries, and will keep a year or more. Take six pounds of cherries and bruise them; pour on a pint and a half of hot water, and boil for fifteen minutes; strain through a flannel bag, and add three pounds of sugar. Boil for half an hour more, or until the liquid will sink to the bottom of a cup of water (try it with a teaspoonful of the liquid); then turn it into jelly cups and cover with paper dipped in the white of an egg.

To prepare the drink: Put a spoonful of the jelly into a goblet of water, and let it stand about ten minutes; then stir it up and fill with pounded ice. Currants and raspberries made into "shrub" furnish a pleasant and cooling drink when mixed with ice-water. Pounded ice is also an agreeable addition to a saucer of strawberries, raspberries or currants. Pound it until it is almost as fine as snow, and spread it over the berries. With fruit it is also an excellent substitute for cream.

Water ices are always acceptable. Those made of lemon, orange, currants, strawberries, and pineapple, are much improved by adding the stiff beaten whites of four eggs to every two quarts of the liquid. Put it in just as it is turned into the freezer, and it will freeze in a foam.—*Scribners' for July.*

SILVER POLISH.—Very many, indeed most of the compounds sold by itinerant venders for silver polish, are not only worthless for silvering purposes, but positively injurious, from the fact that they contain mercury. The following receipt will enable any person to give to a piece of brass or copper a thin coating of silver, and this without the aid of heat. Take of nitrate of silver, 30 grains; common salt, 30 grains; cream of tartar, 3½ drms. Grind together thoroughly, and when you wish to apply it, moisten it with a little water, and rub on the article with a piece of buckskin or other soft leather. Remember, however, that the coating thus imparted is very thin, and will not bear much wear or hard usage. It is valuable for coating the scales of instruments like thermometers, as it gives a dead-white silver surface that shows the figures plainly, and when varnished with some colorless varnish it lasts a long time.

GREEN POTATOES.—The *Food Journal* gives its opinion on the use of green and air-exposed potatoes after the following style: "Even a short exposure to air and light spoils potatoes for food. The use of potatoes is a preventive against scurvy, if not an actual cure for it. Potatoes that have been exposed to the air, and have become green are unwholesome; and new potatoes—unripe ones—have much to do with the prevalence of cholera and such like diseases during the summer months."

Practical Receipts.

CREAM PIE.—1 pint milk, 1 cup sugar, 2 eggs, ½ cup flour. Flavor to taste. Equal to custard.

KEEP sweet oil in a cool place if you wish to retain its sweetness for any length of time in warm weather. The oil should be supplied to the castor daily, and all returned to the bottle that is not used.

TOMATO CUSTARD.—This is said to be a beneficial diet for consumptives. It is made by straining finely stewed tomatoes through a course seive, and adding two pints of milk and one pint of tomatoes, four eggs, one teaspoonful of sugar. Bake in small cups quickly.

FROSTING FOR CAKE.—Beat the white of an egg until you can turn the plate over without the egg running off, then add five heaping tablespoonfuls of pulverized sugar, and one of starch. This quantity will frost one small cake. Flavor to taste.

WAY TO COOK CHEESE.—Cut a quarter of a pound of cheese into small slices, and boil a minute in a teacupful of water; beat one egg and tablespoonful of flour together, adding gradually one pint of milk, pour into the boiling cheese and stir, which after a minute's cooking is fit to serve for a supper relish.

BLACK CURRANT JELLY.—To each pound of pickled fruit, allow one gill of water; set them on the fire in the preserving pan to scald, but do not let them boil; bruise them well with a silver fork or wooden spoon—take them off and squeeze them through a hair sieve; and to every pint of juice allow a pound of loaf or raw sugar; boil it ten minutes.

HAM TOAST.—Chop some ham (which has been previously dressed) very small, and to a large teaspoonful of it add an egg well beaten up, a small bit of butter, and a little cream. Have ready some neatly cut pieces of bread, about the size of a silver dollar, but a little thicker, fried in good butter; spread the mixture on these, and serve them on a napkin.

TO MAKE THE MOCK CREAM.—Put one pint of milk over the fire, wet a tablespoonful of corn starch or maizena in a very little cold milk, add one egg, one large tablespoonful of white sugar, one-fourth teaspoonful of salt, and a little lemon, rose water or nutmeg. When the milk is ready to boil, stir in the mixture and let it boil about two minutes, taking care that it does not burn on. Let it get cold before filling the tarts. Corn starch is so largely adulterated now that sometimes a tablespoonful may not be quite enough, but one trial will determine it.

LOBSTER AND FISH SALADS.—A very nice and elegant dish may be made with all kinds of cold fish, and some kinds of shell-fish. The following way of dressing is for a small lobster-salad, and will do for all fish salads: Have the bowl half filled with any kind of salad-herb you like. Then break a lobster in two, open the tail, extract the meat in one piece, break the claws, cut the meat of both in small slices, about a quarter of an inch thick; arrange these tastefully on the salad; take out all the soft part of the belly, mix it in a basin with a teaspoonful of salt, half a one of pepper, four of vinegar, four of oil; stir it well together, and pour on the salad; then cover it with two hard eggs, cut in slices, a few slices of cucumber, and, to vary, a few capers and some fillets of anchovy.

MUTTON SOUP.—Cut a neck of mutton into four pieces, put it aside, take a slice of the gammon of bacon, and put it in a saucepan with a quart of peas, with enough of water to boil them; let the peas boil to a pulp, and strain them through a cloth; put them aside, add enough water to that in which the bacon is to boil the mutton; slice three turnips, as many carrots, and boil for an hour slowly; add sweet herbs, onions, cabbage and lettuce, chopped small; stew a quarter of an hour longer, sufficient to cook the mutton, then take it out, take some fresh green peas, add them, with some chopped parsley, and the peas first boiled, to the soup; put in a lump of butter rolled in flour, and stew till the green peas are done.

The Next Ore Strike.

Now that the great ore deposit of the Crown Point and Belcher mines has become so well developed and defined, a natural anxiety exists as to which will be the lucky mine in which a similar rich and extensive body will be found. So far as at present known, the next best indications of such deposit, outside of the Yellow Jacket, lie at the bottom of the Savage and Hale and Norcross mines, yet the promises in that direction are nothing as compared with those given in the Crown Point from the very first.

The Gould and Curry, nor the Ophir show anything very encouraging at the lowest levels, and the good, excellent paying ore bodies of the Chollar-Potosi are all in the old upper part of the mine, nothing whatever having been found in the deepest explorations. It may be that it is now the turn of the Imperial-Empire to "strike it," and indeed the result of the present deep explorations are watched with eager interest.

These explorations are now where good bodies of ore ought to exist, even though they do not, and in the long distance which the drifts have to run in passing through the ledge to the east wall, something good in that line ought surely to be developed. We notice, however, that the good bodies of ore generally run in clusters, or in the vicinity of each other, therefore we incline to the opinion that the deep explorations of the Yellow Jacket, Kentuck, or Overman, on either side of the Crown Point and Belcher deposits are more liable to develop similar deposits than any other mines farther remote. However, time will show. *Gold Hill News, June 27.*

ANTIMONY.—Zuck & Hoover and M. E. Hunter, of this city, have discovered a rich antimony mine about twenty-six miles southeast of this city. They have had workmen prospecting and developing the mine for several months. Vast deposits—in fact the entire mountain for hundreds of yards is rifted with rich veins of the ore. Mr. Zuck had an assay made this week, the result of which exceeded his most sanguine expectations.—*Gilroy Advocate.*

THE Pacific Railway Companies have certainly been very liberally treated by the United States Government. Bonds amounting to $64,623,512 have been loaned to them on which interest amounting to $1,938,705.36 has accrued and not yet been paid. Though other bills granting subsidies in land and money were brought before the last Congress for other roads, we do not think any were passed.

CINNABAR has been discovered about 50 miles north of Salem on the headwaters of the Mollato, in Oregon.

To Parties About Building.

A person who is competent to prepare plans and take charge of the construction of Dwellings, Mills, Bridges, or other architectural improvements, will make favorable engagements with persons or corporations in the city or the interior. Has had full experience on this coast, and can insure good satisfaction. Address

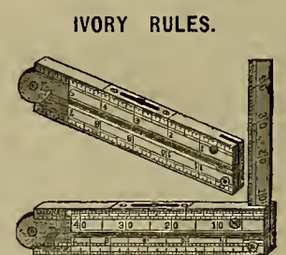
The California Powder Works
No. 314 CALIFORNIA STREET,
SAN FRANCISCO.
Manufacturers and have constantly on hand
SPORTING,
MINING,
And BLASTING
POWDER,
Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and, transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.
We have been awarded successively
Three Gold Medals
By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.
We also call attention to our
HERCULES POWDER,
Which combines all the force of other strong explosives now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other compound now in use.
A circular containing a full description of this Powder can be obtained on application to our Office.
16v20-3m JOHN F. LOHSE, Secretary.

STEPHENS & CO.,
MANUFACTURERS OF
U. S. STANDARD BOXWOOD AND IVORY RULES.


ALSO EXCLUSIVE MANUFACTURERS OF
L. C. Stephens' Patent Combination Rule.
This cut represents the COMBINATION RULE, which comprises a Foot Rule, Spirit Level, Try Square, Bevel, Plumb, Slope Level, Etc.
It is made of the very best quality of Turkey Boxwood, heavily bound with brass, and is graduated with mathematical accuracy.
The Square is adjustable, and can be tested and made perfectly true by the aid of a small screw-driver, but this is seldom required.
In its application as a Slope Level it is especially adapted for Miners' use, as it shows the PITCH TO THE FOOT, and DEGREE OF INCLINATION at once. It is six inches long when folded, by one and three-eighths wide, and three-eighths inches thick, the cut being just one-fourth size.
"By the use of one of these, a builder, mason, carpenter, or other workmen, can always have in his pocket the most valuable of his apparatus used in construction, combined in a portable, useful and cheap form."—*Scientific American.*
Price by mail, prepaid, $4. For agents' terms, address
STEPHENS & CO.,
18v24-3m Riverton, Conn.

$1,000 REWARD! For any case of Blind, Bleeding, Itching, or Ulcerated Piles that De Bing's Pile Remedy fails to cure. It is prepared expressly to cure the Piles and nothing else. Sold by all Druggists. Price $1.00.
O. F. RICHARDS & Co., Agents, corner Clay and Sansome streets, San Francisco, Cal.

Peteler Portable Railroad Co.,
OFFICE, 42 BROADWAY, NEW YORK.

By this invention, one man, with one horse and five cars, does the work of ten men, ten horses and ten carts.
Highly Approved by all who Use Them.
CARS AND TRACKS FOR SALE OR TO LET.
Samples at the office. Illustrated Circulars free.
State and County Rights for Sale.
19v24cow3m

BURLEIGH
ROCK DRILLS
AND
AIR COMPRESSORS.
The Burleigh Rock Drills, which have stood the test of five years constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequalled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunnelling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground, or compressed air when under ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being applied.
Send for illustrated pamphlet to
BURLEIGH ROCK DRILL CO.,
FITCHBURG, MASS.
25v24-6m

REMINGTON'S
BREECH-LOADING
Sporting, Hunting, and Target Rifles.
Same system as the "Remington" Celebrated Military Rifle, of which over half a million have been sold. Its simplicity unsurpassed. For strength and durability unequalled. In accuracy unrivalled. In range, penetration, and ease of manipulation, without comparison.
The "Sportsman's" Delight, the "Hunter's" Favorite, the "Target-Shooter's" Pride. Also
REVOLVERS FOR HOUSE USE.
In these days of thieves and Burglaries, every householder should have a revolver for home protection.
REMINGTON'S RIFLE CANE.
Every gentleman should have one for protection against dogs and rowdies, and for field use.
E. REMINGTON & SONS,
19v24-6m 193 Broadway, N. Y.

SHEET IRON PIPE.
THE
Risdon Iron and Locomotive Works
Corner Howard and Beale Streets,
Are prepared to make SHEET IRON AND ASPHALTUM PIPE, of any size and for any pressure, and contract to lay the same where wanted, guaranteeing a perfect working pipe with the least amount of material.
Standard sizes of railroad Car Wheels, with special patterns for Mining Cars. These small wheels are made of the best Car Wheel Iron, properly chilled, and can be fitted up with the improved axle and box—introduced by this company, and guaranteed to outlast any other wheels made in this State.
☞ All kinds of Machinery made and repaired.

PATENTS & INVENTIONS.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports to DEWEY & CO., U. S. and Foreign Patent Agents, and Publishers of the Mining and Scientific Press.]

FOR THE WEEK ENDING JULY 2ND.

FENCE-PANEL ADJUSTER.—Francis M. Ranous, Yreka, Cal.

SELF-ACTING EXPANSION RAIL AND CHAIR.—William Close, Sacramento, Cal.

MEDICAL COMPOUND FOR THE TEETH.—John Condon Hassell, Nevada City, Cal.

METHOD OF ELEVATING THE MERCURY IN AMALGAMATING APPARATUS. — Ottokar Hoffman, Ellsworth, Nev.

ORE CONCENTRATOR.—Morgan Hungerford, S. F., Cal.

FURNACE FOR ROASTING ORE.—Richard F. Knox and Joseph Osborn, S. F., Cal.

METALLIC PACKING FOR STATIONARY JOINTS.—Ira J. Saunders, Davisville, Cal.

CAN FOR LIQUIDS.—Andrew V. Smith, S. F. Cal.

MEDICAL COMPOUND FOR COUGHS, COLDS, ETC.—John Willey, Oakland, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency

HALLIDIE'S WIRE TRAMWAY.—The wire tramway which was sent with all the necessary appliances, a few months since, to Freiburg District, about eighty miles from Eureka, Nevada, is working finely. The owner of the mine writes that it is a perfect success, discharging ten tons of ore per hour, with two mens' labor. As far as he can judge there is nothing about it to ever get out of order. While it requires but about 2,500 feet of wire he sees no reason why it could not be extended almost indefinitely with equally good results. The carrying capacity might be doubled or quadrupled if desired. After several weeks trial at the mine the unanimous verdict of all who have seen it, is that it is a complete, unquestioned success. So says Mr. C. C. Goodwin, the owner of the mine at which the tramway is located. There is little doubt but that Mr. Hallidie will be well rewarded for his invention, for it is an apparatus which can be introduced with a great saving of time, labor, and money at many of the mines on the Coast. Its success, and the approbation of the owner of this mine, will do much towards introducing the tramway into general use.

MINING PATENTS.—The Commissioner of the Land Office at Washington has issued a circular explaining the new law, and giving instruction for Registers, Receivers and Surveyors-General in each State and Territory containing gold or silver mines. The new law is especially favorable for obtaining patents economically and with little trouble, and numbers of miners are patenting their ground who never would have done so under the old system. Everybody holding mining ground should secure themselves by the acquisition of good titles to their claims which can now be done easily and with little expense.

SACRAMENTO FOUNDRY CHANGE.—The Union Foundry, at Sacramento, is now run by Root, Nelson & Co., successors to "Williams, Root and Nelson. This foundry does a wide range of work, and is one of the oldest and most prosperous in the State.

DIED.—A. B. Lindsay, a well known miner of Nevada county, died in this city on the 10th inst. He leaves an estate of about $160,000, accumulated by his industry in the mines.

LITTLE COTTONWOOD.—Large and distinctive bodies of ore are reported in the English Emma Illinois mines. The Vallejo mine has struck deposits of ore at a depth of 200 feet.

MINING SALES.—The following mining property, in Gold Run District, has been sold by W. H. Kinder to the Gold Run Ditch and Mining company for $80,000 according to the Auburn *Stars and Stripes*. Two-fifths, undivided, of the Druid claims; one-half, undivided, of the Gold Run claims; one-half, undivided, of the Gold Run ravine, the flume therein and the mining ground belonging thereto, extending up the ravine as far as the Rawley claim; one-half, undivided, of the Bay State claims No. 2; the Mechling claims; the Pine Top claims; Kinder's right, title and interest in the Red Dog claims; three-fourths undivided, in the Kinder Co., tail flume, in Squire's cañon; Kinder's interest in the Abeel & Co., flume, being a remaining term of three leases of undivided parts, together with tenements, tools and machinery. Thus it appears that within a brief period, to say nothing of small transactions to the amount of $20,000 or less, there have been sales of mining and ditch property in the Dutch Flat and Gold Run Districts, by James Teaff for $100,000, by Bradley & Gardner for $375,000, and by W. H. Kinder for $80,000, or three sales aggregating five hundred and fifty thousand dollars.

The Schell Creek *Prospect* says that E. P. Rainea and J. Farron have purchased nearly all the mines in the Hunter District for $100,000. A large force of men will be put at work.

New Incorporations.

KATE CAMERON S. M. Co.—July 11. Location: Utah Territory. Capital, $3,000,000 in 30,000 shares. Trustees—George O. Ecker, Madison H. Turrill, Benjamin A. Patteu, F. E. Vonder Meden and Thomas Davis.

DIAMOND S. M. Co.—July 13. Location: Tintic Mining District, Utah Territory. Capital stock, $30,000. Trustees—Wm. Sherman, John Morton, W. M. Brewer, Peter Saxe, and O. H. La Grange.

PRUSSIAN HILL G. M. Co.—July 15. Location: Railroad Flat, Calaveras county. Capital, $2,000,000 in 20,000 shares. Trustees—S. De Greayer, Victor David, W. H. Wright, H. C. Kibbe and J. M. Buffington.

MANHATTAN GRAVEL Co.—July 15. Location: Placer county. Capital stock, $2,000,000 in 20,000 shares. Trustees—George W. Thomas, W. B. Clary, Phillip Stoner, William Hollis and D. L. McDonald.

ENTERPRISE CO-OPERATIVE PUBLISHING Co.—July 12. Object: To purchase, print and publish the Enterprise and Co-operator Newspaper; Capital stock, $10,000, in shares of $20 each. Trustees—W. W. Swadley, D. S. Cutter, R. D. Pitt, J. G. Mullinax, J. R. Pico, J. Newcomb Jr., and L. L. Bullock.

BROOKLYN LAND Co.—July 12. Object: To purchase real estate in Alameda county, and improve the same. Capital stock, $96,000 in shares of $100 each. Trustees—Geo. Tait, C. W. Hathaway, Edward McLean, W. S. Lyon and A. Holmes.

EMMA HILL CONS. M. Co.—July 12. Location: Utah Territory. Capital stock, $2,000,000. Trustees—J. D. Frey, D. C. Haskins, J. P. Jackson, L. C. Fowler

WHITE AND SHILOH CONS. M. Co.—July 15. Location: Butte Mountain Mining District, Humboldt county, Nevada. Capital stock, $3,000,000 in 30,000 shares. Trustees—George W. Clark, S. H. Knowles, John O. Earl, Alpheus Bull and L. A. Booth.

CASTINE S. M. Co.—July 15. Location: Ely M. District, Nevada. Capital stock, $3,000,000 in 30,000 shares. Trustees—Robert Sherwood, George A. Treadwell, R. H. Rogers, Chas. F. Hamilton and C. B. Land.

REMFIELN G. AND S. M. Co.—July 17. Location: White River M. District, Tulare county. Capital stock, $1,000,000 in 10,000 shares. Trustees—Edward Ralston, David F. James, Q. A. Chase, W. H. White and A. Kohler.

ESTHER TUNNEL AND M. Co.—July 17. Location; Little Cottonwood Cañon, Utah Territory. Capital stock, $1,000,000, in 40,000 shares. Trustees—J. Bluxome, A. S. Carpenter, J. S. Bouker, E. J. Hutchinson and J. F. Nesmith.

GRANITE TUNNEL AND M. Co.—July 17. Location: El Dorado county, Cal. Capital stock, $2,000,000 in 20,000 shares. Trustees—J. J. Holmes, Isaac Jessup, W. H. Martin, J. W. Moyle and John R. Logan.

Meetings and Elections.

On the 9th inst. the Central Railroad Co. elected the following Directors for the ensuing year: A. W. Bowman, Horace Davis, A. J. Gunnison, Thos. R. Hayes, George H. Howard, Reuben Morton, Calvin Paige, A. J. Pope and Michael Reese. On the 12th inst., the Board of Directors organized by the election of the following officers: President, Reuben Morton; Vice-President, A. W. Bowman; Treasurer, A. J. Gunnison; Secretary, N. D. Arnot, Jr.

At a meeting of the Trustees of the Pea Vine Silver Mining Company, held the 12th inst., J. B. Dayton was appointed Superintendent of the Company.

The Belmont Mining Co. elected the following Trustees on the 12th inst.; M. J. McDonald, J. W. Gashwiler, J. B. Haggen, Victor Fernbach and S. B. Boswell.

The Trench Gold Hill Mining Co. held their annual meeting on the 15th inst., and elected following Trustees: H. H. Flagg (President,) F. Locan, Charles Foreman, E. F. Stone, Geo. Treat; Joseph Marks was elected Secretary.

At the annual meeting of the stockholders of Eastport Coos Bay Coal Mining Co., held on the 15th inst., the following were elected Trustees for the ensuing year: Levi Straus, Claus Spreckles, J. T. Dean, William H. Sharp, Oliver Eldridge, J. W. Raymond and Lawrence Pool.

The El Dorado South Consolidated Mining Co. have elected the following officers: Trustees; J. S. Slauson (President,) I. Steinhart, A. Hayward, W. F. Leon, H. Epstein, W. S. McCormick and H. Mayers; Secretary, J. W. Clark; Superintendent, W. S. McCormick.

The Savage Mining Co., at the annual meeting, held on the 10th inst., re-elected the following Trustees: J. A. Pritchard (President), J. F. Miller, B. Pearl, Wm. Kahlana, S. Steinhart; A. C. Hamilton, Superintendent; E. B. Holmes, Secretary.

A DISPATCH states that both coal and petroleum have been discovered on the Little Colorado in Arizona.

BULLION YIELD.—The following table of the bullion product of the coast has been compiled by J. J. Valentine, General Superintendent of Wells, Fargo & Co's Express, for the first six months of this year. The sums reported have passed through the hands of the express company, which is considered the best authority we have on the subject. Undoubtedly many small sums have been shipped through private hands of which no record can be had, so this table shows as nearly as can be arrived at the product of precious metals on this coast.

"Clear as Crystal."

PEBBLES ARE MADE from Rock Crystal cut in slices and ground convex, concave or periscopic, for Spectacles. In Europe and in the Eastern States they are superceding glass.

Among the advantages they have over glass are, that being susceptible of the HIGHEST POLISH, they transmit more rays of light, nothing having more transparency.

They are COOLER to the Eyes—a very important gain.

They are much harder than glass, and DO NOT SCRATCH.

The best quality of Crystal is found in Scotland and the Brazils, and is manufactured into lenses by the best workmen in England and France, for

Thomas Houseworth & Co.,

OPTICIANS,

No. 9 Montgomery street, Lick House,

Where they can be obtained, already fitted, in frames, or may be fitted to order.

Persons sending their Spectacles can have Pebbles inserted of the same grade as their glasses.

Illustrated Circular for style of frames sent to any address free.

☞ Pebbles sold as such by us, are Warranted.

Corona Consolidated Mining Company—

Location of works, Eureka District, Lander County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 25th day of June, 1872, an assessment of Ten Cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, No. 409 California street, up stairs, San Francisco, California. Any stock upon which said assessment shall remain unpaid on the 31st day of July, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the 22d day of August, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. F. CRONISE, Secretary.

Office, 409 California street, San Francisco, California.
Jun29-3t

Eagle Quicksilver Mining Company---Lo-

cation of mines, Eagle Mining District, Santa Barbara County, California.

Notice.—There are delinquent upon the shares of the following named persons, on account of assessment levied on the 8th day of May, 1872, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Bush, A T	Unissued.	1	$40 00
Burton, L T	Unissued.	1	40 00
Burton, Benj	Unissued.	1	40 00
Brinkerhoff, S B	Unissued.	2	80 00
Church, Thos. R	Unissued.	1	40 00
Crane, A. M	Unissued.	1	40 00

"HOADLEY."

TREADWELL & CO.,
SAN FRANCISCO,

Are the only Agents for Sale of those Engines in the Pacific States.

"THE HOADLEY"

Is the perfection of the Portable Engine. They are known throughout the Pacific States, and are justly noted for their Efficiency and Perfect Workmanship. We have them with and without wheels, and take pride in commending them as

Threshing Engines,

In which field they have long led all others—and for general use. Beware of Cheap-made Imitations, with their boilers imperfectly stayed, and made of second quality material. Better take a "HOADLEY" at double the price, and know your Life and Property are secure. No man who values either, can afford to buy any other, as hundreds can testify throughout California. Ask any man who has a Hoadley Engine, what he thinks of it.

H & L AXLE GREASE.

TRADE MARK H&L AVOID IMITATIONS

The attention of Teamsters, Contractors and others, is called to the very superior AXLE OREASE manufactured by

HUCKS & LAMBERT.

The experience of OVER TWENTY YEARS, specially devoted to the preparation of this article, has enabled the proprietors to effect a combination of lubricants calculated to reduce the friction on axles, and thus

Relieve the Draft of the Team,

Far beyond the reach of any who have but recently gone into the business; and as the H & L AXLE OREASE can be obtained by consumers at as

LOW A RATE

As any of the inferior compounds now being forced upon the market by unprincipled imitators, who deceive and defraud the consumer.

HUCKS & LAMBERT

Invite all who desire a First-class and Entirely Reliable Article, and which for Over 18 Years in this country has given such GENERAL SATISFACTION, to ask for the H & L AXLE GREASE. See that the trade mark H & L is on the red cover of the package, and take no other.

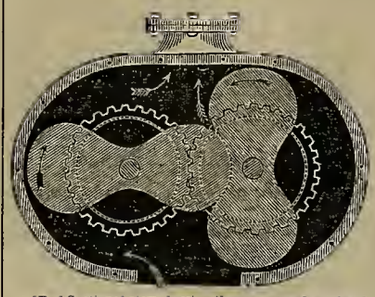
ROOT'S PATENT FORCE BLAST ROTARY BLOWER,

MANUFACTURED AT THE

GLOBE IRON WORKS,

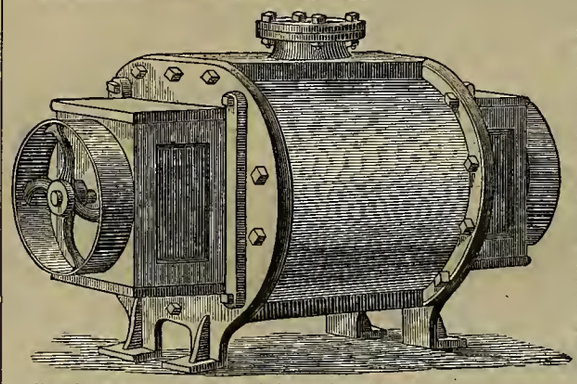
Stockton, Cal.



[End Sectional view showing the pistons and gearing.]

Awarded the First Premium at the Paris Exposition.—Patented November 1, 1864; July 24, 1866; and October 9, 1866.

Adapted for Smelting, Foundry, Mining and Steamships. Requires 50 Per Cent. less power than any Blower now in nse.



One of these Blowers may be seen at W. T. Garratt & Co.'s Brass Foundry, San Francisco; Gould & Curry and Savage S. M. Co.'s, Nevada; and at C. P. R. R. Co.'s Works, Sacramento; and other places on this coast.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have pnt in the market machines of inferior construction, which do not answer all the requirements of the genuine article. Quartz, Saw and Grist Mill, Iron, Stationary and Steamboat Engines, Horse-Power and Pumps, of all Sizes.

Machinery.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will he spared, to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Opsratss as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco.

A Blake's Crusher

FOR SALE CHEAP.

One of Blake's Patent Ore Crushers, size 8x10, second-hand and in perfect order, is offered for sale cheap. Also,

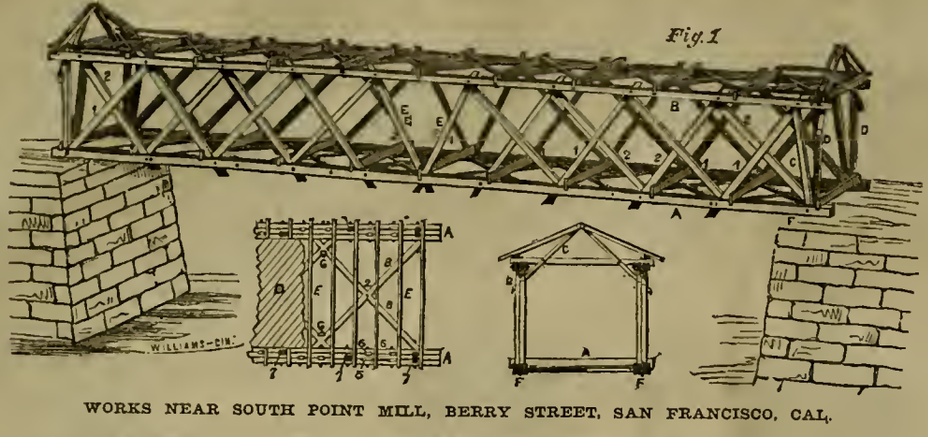
PACIFIC BRIDGE COMPANY,



WORKS NEAR SOUTH POINT MILL, BERRY STREET, SAN FRANCISCO, CAL.

Are Prepared, with Superior Machinery, to Manufacture and Build all kinds of Bridges on Smith's, Howe's, and other Improved Plans. Framing of all kinds done by Machinery.

The Smith Bridges have been thoroughly tested in the East for Three Years, and wherever tried have proved superior to any other Bridge in the following points:

Being built of wood entirely, they are not affected by change of temperature.

The timber used is placed so directly in the line of strain, that less material is required to support the same load.

It is not perceptibly affected by shrinkage. It is the most Economical Bridge built. It is adapted to any practicable LENGTH OF SPAN.

Plans, Specifications and Terms will be sent to any County, Township or Person wishing to build a Bridge, and no charge made unless the Plan is used. For all Public Bridges the Plan will always be open to competition.

Smith's celebrated CAST IRON PIER, economical, and adapted to heavy currents, built at low rates.

C. H. GORRILL, Secretary.

W. H. GORRILL, President.

THE PATENT
Novelty Mill and Grain Separator

one of the greatest improvements of the age for cleaning and separating Grain, while it combines all the essential qualities of a first-class Fanning Mill. It also far excels anything that has been invented for the separation of Grain. It has been thoroughly tested on all the different kinds of mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.

For further information apply to

Publishers, Patent Agents, and Engravers,
No. 338 Montgomery st., San Francisco, Cal.

AGENTS WANTED to canvass every town on the Pacific Coast for the MINING AND SCIENTIFIO PRESS, PACIFIO RURAL PRESS, and the PACIFIO COAST MERCANTILE DIRECTOR. Experienced canvassers preferred. Good men can make large wages, besides learning much and improving their talents.

HINTS FOR INVENTORS. We will send on receipt of stamp for postage, FREE, our 52-page Circular, containing 112 Illustrated Mecbanical Movements; a digest of PATENT LAWS; information how to obtain patents, and abont tbe rights and privileges of inventors and patentees; list of Goverment fees, practical hints, etc., etc. Address DEWEY & CO., Publishers and Patent Agents, San Francisco.

DREYFUS' PATENT SELF-OILERS,

For Shafting, Engines, Machines, Etc.

Save from 75 to 95 per cent. of oil used on shafting or machinery bearings. No better investment for the amount can be made by any person having machinery or running shafting. They are widely known for their rellability and economy. All the trouble of "oiling up" is avoided. There is no waste of oil, and no cans are needed A single trial will prove their valne. We will put them into any mill, and if not perfectly satisfactory, they may be returned at our expense, and the price will be refunded. We have a large stock on hand, of all sizes, adapted to all description of boxes.

Send for Price List and Circular.

LEA & PERRINS'

CELEBRATED

Worcestershire Sauce.

Declared by Connoisseurs to be the only good SAUCE

Caution Against Fraud.

The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name of "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ASK FOR LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.

Some of the foreign markets having been supplied with a spurious Worcestersbire sance, upon the wrapper and labels of which the names of Lea and Perrins bave been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which tbeir right may be infringed.

Ask for LEA & PERRINS' Sauce, and see name on wrapper, label, bottle and stopper.

Wbolesale and for export by the Proprietors, Worcester; Crosse & Blackwell, London, &c., &c., and by Grocers and Oilmen universally. 15v24-eow-tf

PURCHASERS please say advertised in SCIENTIFIO PRESS.

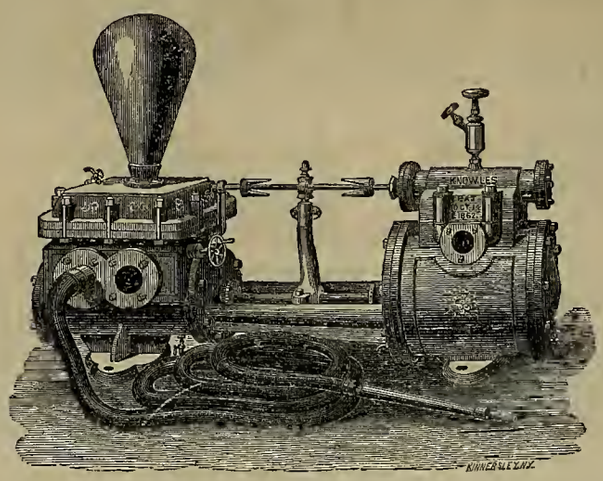
KNOWLES' PATENT STEAM PUMP.

Extract from Official Report of Mechanics' Institute Fair of San Francisco, 1871.

"In the foregoing trials it appears that the most efficient Pump on exhibition is the KNOWLES. The workmanship on this Pump is also very good. We would therefore recommend that this Pump receive a Silver Medal. (Diploma awarded). Signed by the Committee:

G. W. DICKIE, H. B. ANGELL,
CHAS. R. STEIGER, W. EPPELSHEIMER, MELVILLE ATWOOD."

v113-awbp



It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.

The trial of Steam Pumps at the Eighth Industrial Fair in San Francisco, by a Committee of Five of the most thoroughly practical mechanics on this coast, showed the Knowles Pump to lose but 11⅓ per cent., while others lost as high as 40 per cent., showing great difference in economy.

WE BUILD AND HAVE CONSTANTLY ON HAND

THE LARGEST STOCK OF PUMPS IN THE WORLD,

And for Every Conceivable Purpose.

A. L. FISH, Agent.

No 9 First Street, San Francisco, Cal.

P. S.—All kinds of new and second-hand Machines on hand. 3v24-eow-bp

BLAKE'S PATENT STEAM PUMP.

From the Report of the Committee on Steam Pumps, at the Seventh Industrial Exhibition of the Mechanics' Institute, San Francisco

BLAKE'S STEAM PUMP.—This Pump yielded the best results as to the quantity of water diacharged as compared with its measured capacity. The valves are of brass, and well arranged. The steam valves are well arranged for operating the pumps, either fast or slow.

We recommend that a Medal be awarded to it, as THE BEST STEAM PUMP. [Awarded a SILVER MEDAL, the first premium.] (Signed) JAS. SPIERS, WM. H. BIRCH.

From the Report of the Committee on Steam Pumps, at the Eighth (or *last*) Industrial Exhibition of the Mechanics' Institute, San Francisco:

BLAKE'S MINING PUMP.—This is an excellent Pump, well made, and gives a high per cent. of duty. We recommend a Diploma for this Pump. (Signed by the Committee.)

G. W. DICKIE, H. B. ANGEL, CHAS. R. STEIGER,
W. EPPELSHEIMER, MELVILLE ATWOOD.

[No other Steam Pump rceeived other than a Diploma or honorable mention at the LAST Mechanics' Exhibition, *all other assertions to the contrary notwithstanding*. Hooker's Hand Pump was the *only* Pump of any kind whatsoever, that received a MEDAL and FIRST PREMIUM (highest award to pumps) at the *last* Exhibition, for which we are also selling agents.—*See official Report of the above Committee.*]

The trial of Steam Pumps at the Eighth Industrial Fair in San Francisco, by a committee of five of the most thoroughly practical mechanics on this coast (as above named), showed that the Blake Pump gave 86 per cent. of utilized power, while others gave but 60 per cent., showing great difference in economy.

The Blake Pump is the ONLY Steam Pump that EVER RECEIVED A SILVER MEDAL at any Exhibition of the Mechanics' Institute ever held in San Francisco or California.

☞ A complete stock of all sizes constantly on hand at the Machinery Warehouse of the Agents,

TREADWELL & CO.,
Market Street, corner of Fremont, SAN FRANCISCO.

THE TRUTH!

A. L. FISH, Agent Knowles' Steam Pump—Dear Sir: In answer to your inquiries, we state that the highest award for Steam Pumps at the Eighth or last Mechanics' Fair in San Francisco, was a *First Premium* and Diploma, awarded to the Knowles' Patent Steam Pump, as published in the Official List September 23d, 1871.

A. S. HALLIDIE, President Board of Managers.
W. H. WILLIAMS, Sec'y Board of Managers Eighth Industrial Exhibition, M. I.

THE GIANT POWDER COMPANY

Are now manufacturing besides the famous regular

GIANT POWDER, A NO. 2 GIANT POWDER,

Somewhat slower in its Explosion, which we recommend for

BANK BLASTING, COAL MINES,

AND FOR ALL SUCH WORK WHERE THE ROCK IS NOT VERY HARD

It is fully as safe as the other and evolves neither smoke nor noxious fumes when exploded.

Price. 50 Cents per Pound.

The sales of both grades increase very fast, which is the best proof of their superiority over other explosives.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and Progressive Industry.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, JULY 27, 1872.

VOLUME XXV. Number 4.

Fire Damp from Anthracite.

It has, until quite recently, been thought that fire damp would never he encountered in Anthracite coal mines. The theory has been that the heds of hard coal have been subjected to snch long continued heat that all ths volatile hydrocarhons, (firo damp) have heen so effectually driven off that it would be impossible for a snfficient quantity to be developed to render the same explosive, when diffused through the atmosphere of mine chambers or drifts. It appears, however, that some threo months ago. while a party of engineers were examining with a naked light, an Anthracite mine, near Wilksharre, Penn., an explosion of fire damp occurred by which three ot the party were instantly killed, while a fourth barely escaped with his life.

It should he stated, however, that work in the mine had been suspended for a long time, from which, and the further fact that no inflammable gasses had heen perceived during the working of the mine, it may be reasonably inferred that the accumulation had heen very slow, and wonld not have reached a dangerous extent, if a proper circulation of air had been kept up, as would have been the case had work regularly continned in the mine. Still the bare fact that snch gases may accumulate even in an anthracite mine, is one which should be borne in mind, and placed upon record as one of the possibilities connected with that class of mines.

The periodical immolation of scores and hundreds of victims in the English coal mines, to say nothing of similar occurrences which are hecoming alarmingly frequent in our own, appeals to the duty and humanity of inventors to devise some means hy which sneh accidents may be avoided. From the experience of coal mining in England it is clear that unless some such device is perfected, the time will soon arrive when onr own mines will reach a point in depth which will greatly increase the danger of life in working them; and in view of the fact that the material interests of every citizen is more or less dependent upon the lahors and exposures of the delvers after coal, may it not become the duty of the Government to take action in the matter by throwing safeguards around them, by which they may at least be protected from the cupidity or ignorance of those who may he placed in charge of such works. The *Gas Light Journal* suggests, and we heartily endorse the idea, that a scientific commission of skillfull chemists and experienced mining engineers be appointed hy the Government to investigate the questions of lighting, veutilating and seeuring mines from fires, and providing means of escape in case of the latter emergency. Let such a commission make a report to he placed in the hands of proper persons to frame from it a law, which shall enforce such management as shall protect, as far as human foresight and intelligence can do, this useful aud most necessary class of our citizens from tho dangers incident to their calling. They ought at least to he guarded against the cnpidity of employers, and the results of the carelessness of the more reckless of their own uumher.

Prospectors.—The Inyo *Independent* says there is a good chance for prospectors in the foothills west of Bishop Creek and Round Valley. There are numerous ledges, and in the gulches small particles of gold have been found on the surface, bnt no one has yet tried to sink to bed rock.

Canal Boat Propulsion.

Ths propulsiou of canal boats by steam power has occupied the inventive mind of the United Statos for some time past, on account of the large premium offered by the State of New York for the best method of propelling canal boats, without injury to the canal itself. Various plaus have been forwarded from every State in the Union, and California, being as prolific in invention as in fruits, has produced many ingenious methods. One of the latest—which has received our supervison, is a plan proposed by Messrs. Stebbins and Browne of this city.

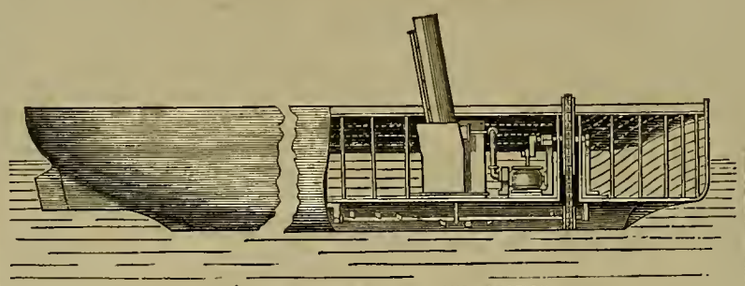

FIG. 1—LONGITUDINAL VIEW AND SECTION.

The accompanyiug cuts, 1, 2 and 3 respectively, represent a longitndinal view and section, a plan, and a cross section. The motive power used is a propeller, composed of any numher of hlades attached to a shaft placed near the bows and running, say one-third the length of the boat, the blades increasing in diameter and pitch (as they approach the stern) in such a manner as to render every blade effective, so that the water thrown hack by the first blade is taken up by the second, on account of the increased speed of the external portion of the hlade, and so on to the last, each hlade acting as an independent motor, and the whole united developing any required power, according to the diameter and number of the blades nsed.

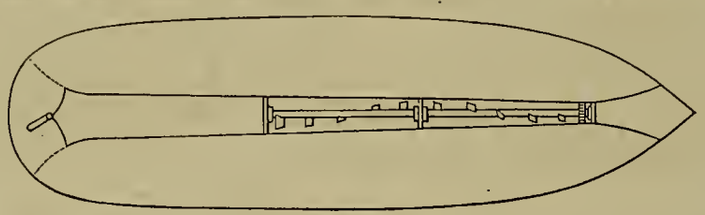

FIG. 2—PLAN.

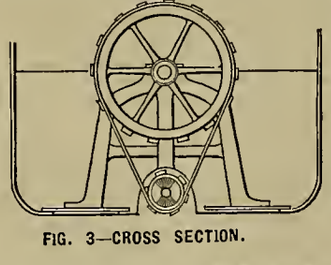

FIG. 3—CROSS SECTION.

This propeller, or serew, works on a hollow or funnel in the bottom of the boat, and open to the water, extending from where it cuts the lines of the vessel from stem to stern, as shown in Fig. 1 and 2. This funnel is hell shaped at the hows till it reaches the screw and its smallest diameter, from this point it expands to the stern, parallel to the screw, thns taking a conical or wedge shape, as in Fig. 2. The motive power is a compact engine placed at any convenient part of the vessel, driving from the flywheel, by means of an endless chaiu to a drum or pulley on ths propeller shaft, (as shown in Fig. 1 and 3) the arms of which sre composed of two hlades, thus formiug the first wing of the screw. The center of the driving wheel being above the level of the water and cased iu similar to the center board of a yacht prevents leakage.

The merits of this plan arc the small diameter of the propeller used, thns disturbing the water less than a propeller of ordinary form and size and at the same time developing similar power, and secondly the longitudinal shape of the hollow, or funnel, in which this screw works. We will briefly describe the action and effect of a screw of this kind working in a conical funnel. The water being open to the action of the screw is sncked in by the first hlade through the bell-shaped mouth, taken up by each succeeding hlade, and the resultant of power of the current thus formed, expanding in the funnel, is parallel to the course of the hoat, which is to say that the current formed hy the screws in this expanding fnnnel expends its force in forcing the boat ahead and not retarding its course hy friction, and dies away gradnally before reaching the stern. From experiments made the plan has been found effective, scarcely disturhing the equilihrium of the water.

We are not informed as to whether the inventors intend entering this device for the premium or not.

Dividends and Assessments.—The assessments of the principal mines of Nevada for the past three months amounted to $831,300, while the dividends aggregated $2,801,000, leaving a profit to stockholders of $1,969,700. For this month the assessments of fifteen companies amounted to $278,000, and the dividends of five amounted to $852,000, leaving a halance of $573,300 to the credit of stockholders.

The Bellingham Bay coal mine, which was flooded with water some time since to put out a fire, has heen pumped out and is now in order to be worked.

Academy of Sciences.

Want of space prevented our giving a full report of the meeting of the Academy in our last issue, and the interesting discussion which was called ont hy Dr. Stout's theory of the formation of the magnetic iron sands was therefore omitted. After exhibiting specimens of the iron, he said that it evidently came from the bottom of the sea, probably from a volcanic origin, and became condensed in the form of crystals hy contact with the cold water.

Dr. Gibbone did not agree with Dr. Stont in his theory of the formation of this iron. He rather thonght its existence on the beach was to be attrihuted to the detrition of strata containing iron. These strata wearing down in the usual manner the heavy sand would naturally separate by washiug, from the rocky detrites. The value of iron deposits depends entirely on the location and snpply of fuel. The hest ore in the world would be valuless if there were no fuel near hy. It has to be associated with coal to be made availahle.

Enterprises Projected.

Dr. Stont said that by a process recently patented, (White's) this irou could be ntilized hy using petrolenm for fnel. Gen. Hewston stated that he had met a gentleman from New York recently, who had come here with a newly patented apparstus for separating magnetic iron from ores. The only obstacle that gentleman had to meet in this country was to find availahle deposits. Dr. Stout proposed to satisfy him in that particular. The agent of White'e patent is also here, and proposes introducing it on this coast. The requisite mahinery for hoth these processes will prohahly be in this city shortly.

An Interesting Discussion

Ensued as to the formation of this irou. In reply to the remarks of Dr. Gibbons, Dr. Stout was convinced that the disintegration theory would not explain the origin of this peculiar form of iron sandstoue as any silicious form of iron would be in the shape of bog iron, or the common protoxide. This magnetic iron was apparently the result of igneous action or condensation from vapor. If you examine the deposits on the seashore, it will he found that the particles further from the water, and longer exposed to the effects of solar heat and light, exhibit a tendency to decompose, and in placee can be found in a state of transition into black and red oxides.

Gen. Hewston said a great deal of this sand will hefound to be in the form of crystals. It will he found a permanent oxide. It will stand a great deal of light and heat, without decomposition. He concurred with the views of Dr. Gibhons, in regard to the iron heing formed from the disintegration of strata containing iron. The particles on the heach are evidently washed from iron-bearing strata in the ocean.

Mr. Stearns said this magnetic iron existed in great abundance, in the country rock in the Lake Superior Copper region, so much so that the ordinary compass was rendered unfit for runuing levels.

Among the contrihutions to the cahinet, was a steel turning, turned from the tire of a locomotive whcel, in the Southern Pacific R. R. Co's. shop, which was 38 feet long, equivalcnt to a shaving 100 feet long. It proved the tenacity and strength of the Firth Steel, such as is imported hy Nelson & Doble of this city.

An exceedingly rich gold mine is reported as having heen discovered in Baker County, Oregon; $4,000 was taken out of one pocket in four days and the average quartz is said to yield $600 per ton.

CORRESPONDENCE.

Notes of Travel in Lander County, Nevada.

[By our Traveling Correspondent.]

Eureka.

Thie thriving mining town is located 70 milee eaet of Anetin, the county eeat of this County, and 84 miles south of Pal-Palisade, or 657 miles from San Francisco. It contains about 5,000 inhabitants, and the district ahout 12,000. The cost of getting to this place from your city, is $56 for fare, besides incidental expenses. On arrival here the traveller can be accommodated with board and lodging, at from $2.50 to $5.00 per day, at four different very good hotels, viz., the "International," "Turner House," "Parker House" and "Eureka Hotel." The altitude of this place ahove the sea level is 6,651 feet. They have a good fire dspartment, and ahove all, good drinking water. Another necessary convenience, the inhahitants are furnished with, are nice warm ewimming baths, in a pond 50x100 feet surface, by from 5 to 7 feet deep at 50 cents a swim, by Gilmore & Co. This place supports a banking house, that of Paxton and Co., and two hardware merchants, Messrs. Mott, Fish & Co., and Maupin & Cromer. The former are also agents of the Giant Powder Co., of your city, which explosive is used in considerable quantities here; 4 diffsrent blacksmithing firms are doing a thriving business, and there are some 30 different mercantile firms here. Messrs. Wise & Henderson do the commission and Storage businees, and C. S. Cardoso sells all the lumber—about 2,000,000 ft. annually. One of the largeet interests represented here outside of mining is that of

Fast Freight Lines.

There are two, that of W. L. Pritchard, and the Nevada Transportation Co. The former run 12 and 14 mule teams, on three different kinds of time, from Palisade to this point; the tast line comes through in 36 hours, next in 2 days, and the slowest in 4½ days; price of freight varies accordinfi to the season, and speed required in tranportation—from 1¼ to 4½ cents per lb. at this writing. The Nevada Transportation Co., run 14 14-mule teams from Palisade; 45 hours is their time. I will now attempt to give your readere a slight description of the mines in this dietrictand their developments.

The Mining Belt

Of base metal ores is ahout 10 milee long by 2 wide; to enumerate the mines or the working claims, we will begin at the north end of the district and give you their names in rotation. First is the

Bullwhacker,

Which is incorporated and belongs to an English company; H. Heyneman of San Francisco, is President, and L. N. Dougherty, Superintendent; they have a shaft down 100 fest, working a numbsr of men, and raising a large quantity of valuahle ore; this incorporation comprises the Dunderberg," "El Dorado," and several other important mines. Smelting works are about to be erected.

Silver West

Comes next. This is the proporty of Col. T. J. Taylor; he has about 450 tons of ore on the dump. He is erecting smelting works which will be completed about the 25th of July.

The Silver West mine ie about 2 miles in a weeterly direction from the town of Eureka. The developments consist of one shaft ore incline with a dip of about 70 degrees. At a depth of 15 feet the incline passed through a horizantal vain of high grade ore 2 feet thick; at a point 10 feet lower it cut a floor of ore 6 feet thick; 3 feet lower it cut a floor 4 feet thick; 4 feet lower it cut a floor 6 feet thick; and at a point 2½ feet lower it cut a floor 3 feet thick. The rock found between the ore beds ie porphyry. The only work done ie on the second floor from the bottom which consiets of a cut or drift north and south 70 feet, with the etrike of the vein, with two parallel cuts east and west ahout 30 feet, apart, and fifty feet in length, in a continuous body of ore. Said drifts have yielded about 800 tons ore, contain about 50 per cent. of lead and from $60 to $120 per ton in silver.

The Excelsior Series

Are on Prospect Mountain, at the head of New York Cañon about 4 milee eoutherly from the town of Eureka. The developments consist of 7 ehafts, all of which disclose fine high grade ore beds. The amount of ore in eight, is estimated at 1,000 tons.

"The Silver West" and "Excelsicr" are the property of John W. Brummagim of San Francisco, John Perchbaker of Napa City, and Thomas J. Taylor of Eureka, Nevada. The next is tho

Silver Lick,

Which is located one-half mile eouth of the "Silver West," owned by Shoenbar & Adams; they have oue shaft down 75 feet, and have on the dumps about 100 tons of good milling ore. Half a mile east is the

Adams Hill Co.

This is an incorporation with a capital stock of $5,000,000 in 50,000 shares. G. T. Lawton is President, W. W. Traylor, Secretary, and A. M. Ellsworth is Suporintendent. This company have a tunnel in 295 feet on the ledge, and a ehaft down 200 feet. Steam hoisting works have just been erected. This company also own the "Wide West," which has heen pierced by a shaft 150 feet deep; 35 men are employed in working these two mines. This company own eix mines. Two are being worked with all the energy possihle, and have any amount of ore. That from the Wide West shaft ie undoubtedly the best ore in the district; the samples assayed vary from $200 to $1,100 per ton. Are now shipping 100 tons to San Francisco of that grade. The Lee mine has oue level 300 feet long on ore all the way. Also the second level, 140 feet deep ie about 70 feet long in ore—good $100 average. It has also another shaft 480 feet distant which is 140 feet desp—all the way on the lead from top to bottom; and the levels are being pushed to connect with that shaft, for air and working purposes.

The Wide West ehaft ie now 150 feet deep; ore at the bottom, and nobody knows how much deeper. The hoisting works are working beautifully, and evsrything scems to give proof that this company have eome of the best mines in this place or even all of Eastern Nevada. The deepest shaft on the Lee mine is 160 feet deep, and the vein eeeme to be a true fissure vein; working about 35 men night and day.

Immediately east of the Adams Hill M. Co., are situated the minee of the

Magnolia M. Co.

An incorporation with a capital stock of $3,000,000, divided into 30,000 shares. N. P. Copp is the general Superintendent. This company have one ehaft down 130 feet, and have 100 tons of good milling ore on the dump; working 6 men. The next on the south, are the mines of

Ths Star Consolidated Co.

The property of this company consist of 24 minee and prospects. Incorporated with $5,000,000 capital, in 50,000 ehares. O. F. Griffin is Preeident, Geo R. Spinney Secretary, and L. C. McKenney, Superintendent. This company have one tunnel in 280 feet, and one in 140 feet; one shaft down 110 feet, one 90 feet, two 75 feet and one 60 feet deep, with varions othere of lesser depth. Working 20 men; 500 tons of extra milling ore on the dump. Next in order is the property of the

Phoenix Silver Mining Co.

An incorporation with a capital etock of $5,000,000 in 50,000 ehares; office No. 26 Hayward's building, S. F. Robert Sherwood is President, and Joscph Maguire Secretary; and E. Caldwell Superintendent. The Phoenix company is situated on Ajax Hill, a emall ravine dividing it from Ruby Hill. Ite western boundary is about 300 feet from Eureka Consolidated eastern boundary, and it is on the eame ore channel. The claim has a perpendicular ehaft 300 feet deep, which is the deepest of any in the district. On the 300 foot level fine ore has been fonnd and is going down. The work dcne underground embraces three different stations, with drifts running off in different directions amounting to nearly 1,000 feet, besides stopes and other prospecting work. Good tracks are laid underground in the different drifts and all ore and waste ie delivered into cars from the shute, and taken to the cage and hoisted up. The underground workings have developed a large body of fine ore which ie being taken out and delivered at their furnace. The ore is of fine quality showing about $50 per ton in silver and gold and 30 per cent. lead on the average. The compauy have constructed hoisting works complete in every particular, with power to hoiet 1,200 feet. They have tracks, ore dump and all arranged for convenient and economical working. The eteam ie controlled as well as the brakes by one man, from a platform adjoining the shaft who also dumps the car. The eteam works are on the Adams & Farren and Drap minee; the company have on Adams Hill two minse, the "Empire" and "Lexington"—both of which contain fine ore, some of high grade, going $300 to the ton. A tunnel location has been made for the benefit of the company running through the Hill and through both claims. Ore now is being hauled to the furnace from these claims; the ore is milling, but excellent for fluxing purposes, to mix with galena oree. The company also own the "Othoo" and Jerry Lynch mines, both rich in galena ores and showing fine bodiee of ore. They are now being worked. The com-company in all six minee. The furnace property consists of a euitable building, 30 horse-power engine, and two furnaces of 35 tons capacity for 24 hours—thus smelting 70 tons per day. About 27,000 hnshele of charcoal and 900 tons of ore on hand, ready to start up with.

The Jackson Mining Company,

Has a capital stock of $5,000,000, in 50,000 shares; J. D. Fry is President, and H. C. Kibbe, Secretary. The Jackson Company's claim is on the same ore belt as the Phœnix, Eureka Consolidated, and Richmond mines. At the opening of the mine, some very rich ore was found near the surface, and the principal work done was when the ore was first etruck, until the past few months, whsn later developmente have shown that the pitch of the ore channel was to the north, and with the elope of hill corresponding with the ore channel of Ruby Hill and Ajax Hill. The company have up a new whim, and a double shaft down a depth of 170 feet, and well timbered. It will be eunk 300 feet before drifting, unless the ore channel is cut eooner. This claim adjoins the Phœnix on the east, and from its location must etrike ore at a greater or less depth. The claim is under the same euperintendency as the Phœnix. One-half mile east of the Star Consolidated above mentioned, is the property of the

Louisville M. Co.,

Lately incorporated, with $5,000,000 capital, in 50,000 sharee; John Howell ie Supt. This company own some 8 or 10 ledges, all of which are situated on "Adame Hill;" it is little developed as yet, but eaid to have rich ore in eight. Next, going south, is the

Ruby Hill Tunnel Co.,

Which ie not incorporated. Thie Co. have a tunnel in 140 ft. in ore; it is located on the north eide of Ruby Hill; working 6 men regularly. Next in order above are the minee of the

Eureka Con. M. Co.,

Which is an incorporation of $5,000,000 capital stock, with 50,000 ehares. G. T. Lawton, President; W. W. Traylor, Secretary and W. S. Keys, Superintendent. The mines of this incorporation are located on Ruby Hill, 2½ miles southwest of the town of Eureka, and consiste of 15 different locations, taking up abont four-fifths of the entire hill, the majority of which are covered by U. S. patente.

Their developments and improvemente consist of 10 different shafts, varying from 70 to 225 feet deep, following the ore doposite, which vary from vertical to an angle of 45 deg.; 120 men find regular employment in this mine; extracting 120 tons daily (24 hours). They have one tunnsl 657 ft. in lsngth, with a branch tunnel 208 ft. long; this tunnel taps the ore bed at 175 ft. from the eurface. Arrangemente are being made to work by steam hoieting apparatus, now in course of construction, when it is expected that nearly douhle the amount of ore will be taken out daily. The ore contains lead, silver and some gold; 20 per cent. lead, $28 in silver and from $20 to $30 per ton in gold. The ore ie brought by teams to the oompany's

Smelting Works,

Which are located in the euburbs of the town of Eureka, 2½ miles distant from the mine, at tho cost of $2 per ton. This company's smelting furnaces are considered the most extensive in the world, covering an area of 200 feet long by 100 feet wide, and run by a 40-horse power engine, driving four of Sturtevant'e blowers of the largest size, and one rock-breaker of the Blake pateut, largest size, which has a capacity of reducing 180 tons daily. With their new furnaces 250 tons of metal will be turned out daily. They are expected to be in rnnning order by August 1st, this year; 75 men are regularly employed at this establishment.

Vein Formation.

The lodes are considered regular contact veins. The front vein is encased in limestone, hoth hanging and foot-wall varying from 10 to 125 feet thick, the back vein encased with a limeetone hanging wall and a quartzite foot-wall. Thie vein is 300 feet in width; the ore hody varies from a few feet up to 40 or 50 feet in width. There are thought to be from 40,000 to 50,000 tons of ore in sight. The average run of bullion for the past two month was 410 tons monthly; 11 tons per day now. On the advent of their new engines 600 tons of bullion will, I am informed, he turned out monthly. Next in order is the

Richmond Consolidated M. Co. (Limited.)

This company are ownere of the Richmond, Colorado, Virginia and Tip Top mines—all in Ruby hill, about two miles in a westerly direction, from the town of Eureka. The smelting works of the company are situated in the southern end of the town, upon the sito of the reduction worke of the old Richmond mining Company.

Prof. R. A. Fisher (formerly of the University of California) assumed the management upon transfer of the property to the present owners, and immediately commenced opening up the mine on an extentensive scale, and enlarging and improving the smelting works. These are now, in respect to the facilities for handling ore and charcoal by a complete eystem of railwaye and other arrangements for eaving labor, and above all, preserving the health of the workmen, the model smelting worke of the Pacific Coast. One of the most valuable of the improvements rsferred to is the

Utilization of the Waste Wind.

By a moet simple contrivance, the wind can be partially or entirely turned from the interior of the furnace and made to pass through a series of pipes placed outside the furnace and under a hood that completsly surrounde it, and thence up the ventilating shaft in front of the furnace. During ths process of "barring out," all the wind thrown by a No. 8 Sturtevant Blower paeses through the ventilating shaft, and the result ie that the workmen at the Richmond furnace are no longer "leaded"—(poisoned by lead fumes.) The universal adoption of Prof. Fisher's systsm must be only a question of time at any lead emelting works where the health of the workmen is at all considered.

Anothsr valuable invention of Prof. Fisher, is a very simple coutrivauce for detecting a

Leaky Tweer.

Tweere often burn out or spring a leak, and the result is that a stream of water is poured into the furnace. Hitherto the only method by which to discover a leaky tweer was by removing tweer after tweer from the furnace, until the impsrfect one was discovered. By thie invention every tweer in a furnace can be perfectly tested in a few minutes.

There is but one furnace now running at the Richmond reduction works, but this is of moneter eize. It has smelted 70 tons of ore in 24 houre. It reduces on the average ahout 2,000 tons per month. A furnace of still greater capacity is now in process of rapid construction.

I was informed that the

Expense of Reducing Ore

At the Richmond furnace, according to laet report made to the Board of Directors wae $13.02 per ton, against $19.12 per ton—the cost of reducing 18,325 tons at the emelting works of the Eureka Con. M. Co's furnace—$6.10 per ton. A nice little dividend on 2,000 tons per month.

The queetion of

Supplies of Fuel

Will be a serious one in the future, with the emelters of Eureka Dietrict. The manager of the Richmond, seems to have taken time by the forelock. The charcoal bine of the company have a capacity of about 300,000 bushels, and are already about half full. We were informed that on or before December 1st, the bins (notwithstanding the enormous monthly consumption of charcoal) would be filled—to furnish a supply for the six months following. Such an amount of money locked up in charcoal requires precautionary measures against firo. These are abundant at the Richmond Furnace. A wooden tank holding 16,000 gallons, stands (filled with water) upon the hillside, elevated 100 feet above the furnace floor and a second tank (entirely built of stone), holding 11,000 gallons at a less elevation, supplies the tweers with water. A 12-inch Cameron steam pump, placed in the well thirty feet below the surface, furnishes a most abundant supply of water, clear as crystal. In case of fire, the water can be at once turned off from the stone cistern, and the whole force of the pump brought into use on the fire.

The Richmond Mine.

We did not visit this mine, but learned from the best authority the following facts

in regard to it. Since September 1st, there has been raised nearly 11,000 tons of ore. This vast amount was raised entirely by windlass. During the present week a powerful donkey engine has been put into successful operation. The engine was built by Messrs. Hawkins & Cantrell of San Francisco, after a new pattern designed by this firm.

We learn that the body of ore in this mine is immense—the breadth of the vein at one point reaches one hundred and thirty feet, the breadth of timbering probably exceeding anything of the kind in the world. It has been predicted that the Richmond never could be so securely timbered as to stand. But the skill and experience of Mr. Patrick Rossiter, the foreman, has overcome every obstacle, and the interior of the mine is to-day as safe as before any of the ore had been worked out.

The ores of the Richmond mine are the so called "carbonates" (of lead), but contain as well a certain amount of galena. Experience has proven that as the ore is richer in lead it contains more silver and less gold. The furnace product ("base bullion") of an assay value of $300 or more per ton is shipped by teams to Palisade, (85 miles distant,) and thence on C. P. R. R. to San Francisco. In San Francisco it is either sold to Selby & Co., or shipped thence to New York.

Charcoal.

This interest, in this section, is one of the first, for it is the fuel that is used by all of the mills and smelting works in the district. Among the principal dealers in this line in Eureka are Whisler, Reilly & Lockwood. This firm burn and dispose of from 700,000 to 1,000,000 bushels annually, employing 400 men and upwards in the business. This coal rates at from 30 cts. to 35 cts. per bushel; 78 yoke of cattle are owned and brought into requisition by this one firm. The coal kilns are located from 8 to 35 miles distant from Eureka.

Home Ticket S. M. Co.

This company's mines are situated about 3¼ miles southwest from the town of Eureka. The Home Ticket proper has an incline shaft on it of 143 ft. deep at an angle of about 35°. The ledge or vein is pitching in the hill to the northwest. The body of ore is about 7 ft. wide—value of ore from $75 to $80 per ton in silver and from 20 to 30 per cent. in lead. Adjoining that on the east is the "Walter," which has a shaft down perpendicular 100 ft. showing a continuous body of ore. At a depth of 100 ft. the body of ore pitches to the northwest. Adjoining that on the east is the "Selby" mine, which has a shaft down about 50 ft., showing ore from top to bottom.

Southwest is the "Oro Cash"—with a shaft sunk 58 ft. deep perpendicular, ore pitching to the northwest. P. H. Smith is Supt. of the above mentioned mine. Southwest of this is situated the

Orange Mine,

The property of Dr. J. A. Nesbit; a shaft is down on this mine 320 feet, with a drift 80 feet to the west in ore, working some 8 men. They have on hand about 100 tons of ore and have never used one pound of powder to get it out. Mr. N. has shipped during the last year over $20,000 worth of ore, gross. Above the Orange on the same mountain, is located the property of the

Lander Cons. M. Co.,

An incorporation of $5,000,000 in $50,000 shares. John Harrold is Superintendent. This company own five different mines or locations; have a shaft down 50 feet deep, and some ore on the dumps. Next in order comes the

South Eureka M. Co.,

An incorporated mine developed to a depth of at least 100 feet by shaft, working about 6 men, under charge of Major Drieshach. There are some 1,200 other different locations in this district, not above enumerated, all of which are more or less developed, and are now being worked. There about 60 tunnel locations under the the new law.

The Coy Hill Mines.

Some of the very best milling ores in this district are of recent discovery, and this discovery has an important bearing on the future of the district, from the fact that it is a real development of milling ores in quartzite formation, the general opinion being that such veins are apt to prove true fissures.

Coy Hill, on which this recent discovery was made, is located on the west side of Eureka Valley, nearly opposite the mouth of New York cañon. The mines were first located and brought into notice about the first of April last by Geo. W. Kinney, the District Mining Recorder, and M. G. Cavanaugh. They consist of a series of *gash* veins, having an east and west course, and spreading north and south a distance of seven or eight hundred feet. These gash veins are from a few inches to fifteen and eighteen feet in thickness, and yield fine ores; assays varying from $30 to $2,000 per ton. About fifty tons of ore have been worked at the Lemon Co.'s mill and the Richmond furnace, running from $109 to $175 per ton.

The Paul Jones, Wild Rover, Selden and Dick mines show the best ores. The Bonito, Winnemucca, Douglass, Horse Shoe and Lassie also show good ores, but are undeveloped.

The quartzite formation extends from Secret Cañon to and terminates in Coy Hill, a distance of fully three miles, and is yet to a great extent to be prospected.

The Phenix and the Lemon Mill and Mining companies are among the important companies here that I failed to get any particulars of. From White Pine in my next.

L. P. MO.

Scientific Progress.

Vegetable Physiology.

Some interesting researches have lately been made into the character and movements of the chlorophyl grains in the cells of leaves. Sachs was the first to discover that the chlorophyl or green substance of leaves were less intense under the direct sunlight than under diffused daylight. This discovery lead to the further fact that, in the movement of the grains of chlorophyl, they group themselves during the day (but only under the action of the more refrangible solar rays) upon the more illuminated horizontal cell walls, and withdraw at night to the perpendicular walls. The *direct* sunlight causes the same movement of the green particles that darkness does.

In the action of light in assimilation, in the decomposition of carbonic acid and in the formation of chlorophyl, all the researches go to confirm the generally received view that such phenomena are dependent solely upon luminous intensity, and that the most refrangible rays are most efficient. It is found that in plants where

White light decomposes	100	parts of	carbonic acid,		
Red and orange	"	32.1	"	"	"
Yellow	"	46.1	"	"	"
Green	"	15.0	"	"	"
Blue, indigo, violet	"	7.6	"	"	"

As to the phenomena which result from the absence of light, Kraus has studied the difference between stems and leaves when subject to the bleaching effect of the direct rays of the sun, and has found that the limbs of leaves undergo complete arrest of development in darkness, while the space between the joints of stems elongate much beyond their normal dimensions. The blade of the leaf completes its growth, after coming into the light solely from the materials which it assimilates into starch or its equivlent. Starch in older times is of no use to it. In darkness none of this is produced, and so its growth is arrested.

The Spring Period of the Maple.

Schroeder has devoted much attention to the successive phases presented in the development of vegetation from the ascent of the sap at the moment when the expanded leaves begin to decompose carbonic acid.

The maple, under the latitude of Breslau, "*weeps*" for about a month; the sap rises gradually to a certain level, when it descends again by degrees, in proportion as the development advances. Holes pierced in the trunk, at different hights, enabled this sap to be collected daily; and very numerous analyses keep us informed of the smallest variation in its composition. It always contains sugar, a transitory product of the transformation of the starch accumulated in the tissues during the preceding summer, and destined to become retransformed when it reaches the buds. The proportion is but slight, at the first awakening of vegetation; it increases gradually up to a certain maximum, in proportion as the vital phenomena acquire more intensity; and, finally, it diminishes when the young organs, approaching the term of their development, are on the verge of sufficing for themselves. These facts are perfectly in accordance with such a theory of growth as has been established by the researches of modern observers. The albumen and the mineral salts and their dissemination in the sap, at different hights at the same moment, and at different periods, is exactly governed by the different phases of development.

The Microscopic Examination of the Bud.

The different substances which are called upon to assist in the development of the young leaf are traced by means of the microscope and re-agents from cell to cell. Two, especially, give origin to detailed observations, namely starch and tannin. The dissemination of the former in the different tissues, its transportation through the starchy layers of the fibro-vascular bundles, its disappearance toward the point of vegetation, at the surface of which it speedily reappears as cellulose—all these different phases have been carefully studied and followed up. As to tannin, it is developed in all the cells of the bud; and when once it has made is appearance it persists there, without appreciable change. Its function has greatly embarrassed M. Schroeder, as he was unable to recognize in it any of the characters of an excrementitial product, properly so called. The fact that it is constantly to be found in the youngest tissues (in which life is most intense), seems to indicate that it is a sort of final product, charged with a still unknown office in the life of the cell. If the true chemical nature of this substance were better known, the solution of the problem would, perhaps, become easier.

The above has been condensed from a communication in the July number of the *American Journal of Science*.

The Pacific Ocean.—Under the authority of an Act passed at the last session of Congress, active preparations are now being made for a hydrographic survey of the Pacific Ocean, from the fortieth parallel of north latitude to the fortieth of south latitude. Seventeen lines parallel with the equator and 5°, or 350 miles, apart are to be run across the ocean, and frequent observations are to be taken on each line, of the depth and temperature of the water, the character of the bottom, the course and speed of the currents, etc. This programme is not adapted to immediate national and commercial interests. The survey *should* begin at Behring Straits and be finished thoroughly to the Northern Tropic before anything is done in the Torrid or South Temperate Zone. This selection of the parallel of 40° as the northern boundary of the survey would leave Oregon, Washington and Alaska out in the cold.

A Singular Meteor.—A meteor fell in Westphalia about a year ago which, on analysis, proves to consist of but a single mineral—bronzite, made up of silica 54.51, protoxide of iron 17.53, protoxide of manganese 0.29, magnesia 26.43, lime 1.04, alumina 1.26=101.06. Only one other mineral was ever found similarly constituted; while only two others have ever been found to consist of a single mineral only, one of which was olivine and the other enstatite.

An Enormous Ruby.—Prof. Sheppard, of Amherst College has recently made a valuable addition to his splendid cabinet of minerals. This addition consists of a ruby of enormous size—the largest in the world—weighing 316 pounds! It was discovered in one of the Southern States, and was about to be taken to Europe when the Professor secured it by an offer of $300. Cheap enough.

The Planet Jupiter.—*Cornhill* contains a very interesting article entitled: "A Giant Planet," in which the late observations on the planet named are admirably collated. The substance of these observations lead to the belief that this planet is in an incandescent state; that it is in reality a star to its own system of planets, or moons, as indeed all the planets having attendant satelites no doubt once were.

The Smell of Onions.—In the onion there is found a peculiar oil containing sulphur, called the sulphuret of allyle. The odor of the breath after eating onions is caused by the presence of a small quantity of this oil, which is exhaled when breathing.

Mechanical Progress.

Steam in its Fickle Moods.

A writer in the *Railway Review* says: The notion prevails that a sound steam boiler, well supplied with water, will never burst at any reasonable pressure. Unfortunately engineers act upon this hypothesis, and still more unfortunate is it, that *when not to do so*, and *why* is almost impossible of demonstration. Facts, well known to every practical engineer, show that every little while a boiler which, under apparently identically the same circumstances in every particular, on one day makes steam enough, on the very next day will not, and can not be made to generate enough for more than light duty. Train dispatchers occasionally find their trains thrown into confusion from unexpected delays, and upon careful inquiry into the cause, are informed that for some unexplained and mysterious reason, the engine men cannot make steam enough to do their ordinary work.

Again every little while a boiler explodes, for which no possible cause can be assigned. And not only this, but such like "acts of God," very often follow each in quick succession for short periods. Three were reported on one day, within the past year and only a hundred or so miles apart. In short, it seems to be conceded that steam, in boilers, may be generated in greater volumes in the same given time (and that, too, very quickly) on some days than upon others; and hence it is reasonable to conclude that what would be prudent management of a boiler at one time, might be very imprudent at another.

To ascertain this accurately is certainly a desideratum. It may be that the condition of the atmosphere has something to do with the abnormal eccentricities of steam boilers. A close watch of barometric changes at those times when the generation of steam is found difficult, electro-metric observations—as far as instruments are perfected for that purpose—in short, in search into "Æther" by competent scientific analysts, might, possibly, reveal their causes and supply the engineer with means of knowing when danger threatens, just as our seamen are warned and protected by the storm signals which have been found so beneficial.

As yet, whatever investigations, if any have been made in this direction with reference to such an end, are not made known. Probably very little inquiry has been had; owing, perhaps, to the fact that so few of our practical, mechanical engineers are scientific men. Many, indeed the great majority, are skillful in manipulating their engine and faithful and fearless in the discharge of duty. But these men who are the very ones to know, and who do know, when strange phenomena are manifested, are not the ones to search for causes. They are not educated to the point where such investigations are possible for, or interesting to them to make. Their knowledge ends with their experience of the facts.

We indulge the hope that our meteorologists may take this subject under serious consideration, with a view of ascertaining what are the indications of the atmosphere on those occasions so unfavorable to the generation of steam; the great obstacle being, after all, that they can not know of them at the precise time.

In this connection it is naturally suggested, as we have repeatedly urged upon the attention of railway managers and others interested in the employment of steam, that our practical engineers should be afforded a good educational institution, where preliminary training would beget a taste for, and supply the means of making scientific researches, with the view to elucidating many just such phenomena as we hint at. And we have faith to believe that the day is near when they and their laws and operating causes will be fully understood, and men will wonder how this knowledge could have been dispensed with so long with so few dissasters.

American Locomotives for Europe.—The Baldwin Locomotive Works of Philadelphia, build locomotives cheaper and better than similar works in England or Belgium, and this establishment exports engines constantly to foreign countries. Its business in this particular line has not been restricted by any inability to compete against European builders, but solely by the enormous extent of the American market. Since the accession of the present management, M. Baird & Co., the concern has been enlarged very greatly, and is now producing at the rate of four hundred and thirty locomotives a year. It is now working upon a Russian contract, but at the same time is making engines for all parts of America.

Indelible Ink for Zinc Labels.—A New York correspondent of the *Gardener's Monthly* in relation to making zinc labels, lately inquired for in the *Western Rural*, says: First let the label oxidize a little by dipping it in water for a day or two before using, and then write with a common lead pencil. We have seen labels in use for twelve years so written, as "black as ink," and with all the appearance of lasting for half a century. This plan was discovered, we believe, by Col. Wilder, and was first communicated by Mr. E. V. Petticolas, of Cincinnati.

Paper as a Means of Defence.—Colonel Muratori, says *Engineering*, has made a successful application of paper as a defensive material in the construction of a cuirass, which, weighing the same as the ordinary service cuirass, is capable of far greater resistance. It will turn a regulation pistol bullet fired from a distance of three feet, and is equally capable of resisting a bayonet thrust. The inventor claims that the fabric can used for armor plating ships of war, and especially suitable for covering bottoms of vessels to protect them from explosions of torpedoes.

Another Monster Ship.—It is said that specifications are at present in the hands of several Clyde shipbuilders for a vessel to be built for the National Steamship Company, of dimensions only second to the Great Eastern. Her length is to be 576 feet over all, and she is to be fifty feet beam and thirty-five feet in depth. It is expected that the great steamship will make the voyage from Liverpool to New York in seven days.

Puddling by Petroleum.—It is asserted by the French technical journals that the experiment of using petroleum as fuel in the puddling furnace, which has been in progress at a large iron producing establishment during three months, has proved itself to be very successful. In point of convenience, efficiency and in the superior quality of the iron produced, it is asserted that petroleum affords the best fuel that has yet been employed.

A machine at New Haven performs the whole process of making needles without the manual labor of any person, and turns out 30,000 to 40,000 of them daily. Another machine picks them up and arranges them heads and points together, and the third piece of mechanism puts them into paper.

Railway Progress.—At the commencement of 1871 Europe had 63,182 miles of railway in operation; America had 54,438 miles, of which 50,000 miles were in the United States; and Asia, Africa and Australia had 6,495 miles. The total milcage for the world was 123,115 miles of railroad.

NOTES.—†—California. *—Washoe. ‡—White Pine. §—Ely District. ¶—Eureka District. ‖—Idaho. ⁞—Nearly. ⁂—Over.

S. F. Stock and Exchange Board.

Thursday, July 25, 1872.

The Sales at the San Francisco Stock Board for the week ending Friday, the 18th inst., amounted to $3,188,000. The feature of the week was the operations in Imperial. The North Star mine raised 106 tons of ore last week, and 130 tons were reduced, leaving 47 tons on dumps. The Hale & Norcross mine turned out over 707 tons during the same period; the Savage 1,037 tons, assaying $27.51 per ton. From the 8th to the 22d inst. $51,000 was shipped from the Meadow Valley mine. The Eureka clean up last week was 675 ounces of gold amalgam. Ore extracted from Crown Point for week ending July 19th, 3,021 tons valued at $107,839.98; ore extracted from Cholar Potosi for week ending July 20th, 920 tons; hullion shipped from Raymond and Ely mine on 21st inst., $33,216, making a total of $280,374 on July account.

News from all the mining Districts is favorable with the exception perhaps of Reese River. The *Reveille* complaine that, with the exception of a few of the principal mines, work is not being pushed with the energy noticeable for some months past. A number of small mines have shnt down, most of them temporarily, and recently the chloriders have been gradually quitting work. The reasons are that they have to wait too long to get their ore worked, and the cost of reduction reuders all low-grade ores—from $30 to $50 rock—utterly valueless. Small operations do not pay. The *Reveille* says the district will have to contend with the latter objection until some cheaper means of reducing their peculiar class of ores ie discovered. Wood, freight and lahor are high. It has heen aserted hy parties who pretend to know, that the ores can he worked to a profit to the mill for $25 per ton, which would render the $40 or $50 rock availahle, hut all efforts to do eo have proved thus far failures.

The developments in the Imperial are proving satisfactory. The Superintendent's letter of the 18th, eaid the ore in the 1,600-fool level showed 9 [feet wide and not yet through. Assays run high, from one-third to one-half gold. On the 19th it showed 10 feet wide. On the 20th the cross-cut ehowed ore 12 feet wide, etill in good face. A letter of the 21st statee that the cross-cut showed ore freely 15 feet wide, and work was stopped on account of indication of water, until a pump could he put in the incline. On the Daney the main shaft is down 612 feet, and they expect to pierce the vein at a depth of 650 feet.

A dispatch from the Pioche mine dated 22d inet. saye that the ore in the face of the drift has come in three and one-half feet wide and averages $350. A dispatch dated the 24th etates: "The face of the drift (80 feet) of the first level has ore three and one-half feet which assays $300; the north winze is down sixteen feet, showing ore two and one-half feet wide, assaying $240; the south winze is down twenty-seven feet; the ore in the bottom, two feet wide, is first-clase."

On Saturday stocks were in good demand and most prices were higher than on the day previous. Compared with highest prices on Friday, Alpha advanced $1; American Flag, $2; Belcher, $35; Caledonia, $2; Chollar-Potosi, $8; Confidence, $1.50; Eureka Consolidated, $1; Hale & Norcross, $8; Imperial, $1; Kentuck, $20; Mahogany, $1.50; Pioche, $3.50; Raymond & Ely, $7; Savage, $5; Segregated Belcher, $2.50, and Yellow Jacket $4. Gould & Curry declined $10; Crown Point, $5; Golden Chariot, $2; Ida Elmore, Justice, Ophir, Original Hidden Treasure aud Overman, each $1.

On Friday considerable activity mauifested itself in Ely District shares, and the transactions were as large as on the previous day. Monday the features were Bacon, Imperial, French, Empire and Eclipse. All the Comstock shares was higher. The Pioche is expected to pay a dividend of at least $1.50 next month. It is understood that the Baltimore, Baltimore American and other mines will he consolidated under the name of the Baltimore Coneolidated Mining Company.

On Friday morning, the 19th inst., stocks were irregular. From higheet rates on Thursday Caledonia advanced $4; Consolidated Virginia and Crown Point each $2; Confidence, $1; Gould & Curry and Hale & Norcross each $5; Justice, $1; Ophir and Overman each $2; Sierra Nevada, $1. Alpha declined $1; Belcher, $16; Chollar-Potosi, $3; Exchequer, $1; Savage, $3; Segregated Belcher $2, and Yellow Jacket $1.

On Monday there was considerahle excitement in the market and prices still advanced. From Saturday's sales Alpha advanced $14, Bacon $10, Caledonia and Consolidated Virginia each $2, Chollar-Potosi $4, Eclipse $2, Exchequer $7 50, Empire $4, Gould & Curry $20, Hale & Norcross $10, Ophir $2, Overman $3, Segregated Belcher $4, Succor $1, Trench $3.50, Yellow Jacket $5. Belcher was $15 lower and Justice $2.

On Tuesday the feature of the market was the continued advance in Gould & Curry, Savage and Hale & Norcross. Compared with higheet morning ratee, Caledonia advance $2, Consolidated Virginia $1, Gould & Curry, Hale & Norcrose and Kentuck each $5, Ophir $2, Overman $3, Savage $53 and Yellow Jacket $7. Alpha declined $1, Bacon and Belcher each $5, Crown Point, Exchequer, Imperial and Segregated Belcher each $1, Empire Mill aud Trench each $2.

On Wednesday the market was etrong at higher pricee. At the afternoon Board prices closed generally higher. Pioche, $4; Raymond & Ely, 2; Savage, $22; Meadow Valley, [$1; Eureka Con., $1; Overman, 4; Gould & Curry, $6; Crown Point, $5; Con. Virginia $1; Chollar, $1. Alpha fell $10; Bacon, $1; Imperial, 50 cents; Empire, $1; Kentuck, $7; Jacket, $1.

To-day stocks were rather weak. From highest rates yesterday morning Crown Point advanced $5; Consolidated Virginia and Ophir each $1. Alpha declined $7; Bacon, $10; Caledonia, $4; Gould & Curry, $17; Hale & Norcross, $8; Imperial, $2.50; Overman, $6; Savage, $15; Segregated Belcher, $2; Yellow Jacket, $8; Confidence, Consolidated Gold Quartz, Eclipse, Empire, Exchequer, Knickerhocker and Trench each $1.

[The laet reports concerning the progress of work and the latest developments in all the prominent mines on the coast, will he found iu our "Mining Summary."]

Mining Summary.

The following ie mostly condeneed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE COUNTY.

Good Ore.—Monitor *Miner*, July 13: Extra good ore is coming out No. 3 of the M. & N. W. Co., and also of the lower works of the Schenectady.

AMADOR COUNTY.

Union Mine.—Jackson *Ledger*, July 20: Work was commenced a few days ago. The hoisting works over the main shaft are completed, the water drawn from the mine, and workmen are taking out rock.

BUTTE COUNTY.

Big Lump.—Chico *Enterprise*, July 19: The mines about Nimshew are paying well. Last week the Indian Spring Co. picked up a nugget weighing 36 ozs. The Sigby claims are paying well.

CALAVERAS COUNTY.

Upper Country.—Calaveras *Chronicle*, July 20: Items.—The east chimney of the Prussian Hill ie gradually improving....J. C. Herzer cleaned up 62 tons of assorted quartz at Railroad Flat; No. 1 ore paid $53 per ton; No. 2, $37½ per ton. Over 200 tons on dump, yet....In the Wolverine in raising from the 200-ft. level, on the middle chimney, the pay ore widened to 3 ft., showing free gold all through it. A etreak nearly 10 in. wide will mill not lese than $400 per ton....32 tons of San Bruno ore produced 72 oze. of retorted amalgam....The Soap Root mine has heen honded for a large amount ....Henry & son are running a tunnel to tap two parallel veine, Madre and Valentine, at the depth of about 100 ft. The tunnel is 320 ft. iu lengh; 70 ft. farther, it will cut the Madre; Morse & Co. have some 60 tons of firstrate ore on the dump....Rumor has it that a portion of the Bartolo is about to change hande at a large figure. Late developmente in the shaft prove that the mine is a permanent euccess....Ore iu the Blazing Star shaft is gaining in gold....thc unnsually rich rock in the Wolverine, Bartolo and Blazing Star create considerable excitement.

State of Maine.—A battery of five stamps has recently heen put up and the work of prospecting the vein is being prosecuted with euergy. The ledge is a wide one, and the rock will average $25 per ton.

Crushed.—Ten tone of qnartz from the Sau Bruno mine, Mosquito Gulch, recently crushed in Harris' mill, ehowed an average yield of $70 per ton.

Completed.—Champion & Dunston, who had a contract to run a hedrock tunnel 800 ft. in length, for W. V. Clark, Railroad Flat, have completed the work.

Furgerson.—San Andreas *Citizen*, July 20: The Furgereon mill, at Sheep Ranch, has commenced crushing rock.

EL DORADO COUNTY.

Mendon.—Placerville *Republican*, July 18: Mining prospects are hrightening. Wm. Barney has run a tunnel in the hill on the north side of Stouy Gulch, and is getting hig pay. A Mr. Claypole has run a prospecting tunnel on the south side of Cedar Creek, near Cedarville, which he says pays a dollar to the foot.

Pocahontas.—Placerville *Democrat*, July 20: The mill has been closed for some little time for repaire. It will start up about the middle of next week. The Co. have about 600 tons of good rock on the Dump.

INYO COUNTY.

Bullion.—Inyo *Independent*, July 13: Hiskey & Walker shipped from their Deep Spring mill 10 hare, weighing 3,664 oz., valued at $4,-000, the product of Lida Valley ore.

NAPA COUNTY.

Improvement.—Napa *Register*, July 20: The parties purchasing the Whitton Quicksilver Mine intend in a short time to commence the erection of extensive improvements on their minee. New and improved machinery will he put in, huildings will hc erected, and other necessary work will he done. The whole will coet over $20,000.

NEVADA COUNTY.

Reese's Claims.—Grass Valley *Union*, July 20: Theee claims are on Randolph Flat. Last week Reese panned out the precious at the rate of $10 to the pan.

The Mines.—Maryeville *Appeal*, July 16: The mines at Camptonville, (Yuba Co.), North

San Juan, Sweetland, Buckeye, (Yolo Co,), Forest City, (Sierra Co.), French Corral, etc., all have plenty of water, and never yielded better. The strike made in Bald Mt., near Forest City, some months since proves to be permanent, the gravel developing into a perfect lead of richness.

PLACER COUNTY.

MICHIGAN BLUFF.—Cor. Auburn *Stars and Stripes*, July 18: The Van Emmon Bros. are the owners of the most extensive and valuable mine in this place. We were shown this evening the finest pan of gold dust that it has ever been our fortune to witness. It was taken from 150 ft. of the upper end of their flume. It contained between 2 and 300 ounces, and is valued at $5,000.

ENTERPRISE.—A Co. of S. F. capitalists have it in contemplation to commence systematic operations at an early day, having in view the opening and thorough development of the Manhattan, a short distance above Michigan Bluff.

AUBURN CO.—Auburn *Herald*, July 20: The shaft is 125 ft. deep, and from 90 to 125 ft. the ledge has uniformly increased both in extent and richness. The pay ledge is 2¼ ft. thick, besides about 1¼ ft. of decomposed strata, making about 4 ft. in all, between the walls. The rock taken out at present prospects very rich; 10 men are employed, and the work of sinking and hoisting goes on day and night.

PLUMAS COUNTY.

NEW DITCH.—Quincy *National*, July 13: The new Co. in possession of the Hungarian Hill claims are running a line of ditch from a point about 200 ft. above the highest ground on their claim, towards Mill Creek.

NEW DIGGINGS.—A Co. has recently opened a claim in the gravel range in the Mountain Meadows, and are making good pay.

LA PORTE.—Marysville *Appeal*, July 17: Yesterday we were shown a very fine nugget of gold panned out of the mine of Conly & Gowell. There are engaged in cleaning up their ground after 4 months' run of ground sluicing or hydraulic washing. About 150 days' work have been put in. They expect to take up $125,000, possibly $150,000 for their seasons' run. Our informant visited most of the diggings about La Porte, and in one claim saw $80 taken from a single pan of dirt, and saw several other pans washed, ranging from $30 to $50. New diggings are being struck, and rapidly developed.

SAN DIEGO COUNTY.

BULLION.—San Diego *Union*, July 11: W. F. & Co. shipped to S.F. by the Orizaba, gold bullion valued at $1,659 from the Julian mines.

GOOD PROSPECTS.—The Kentuck has cleaned up 30 tons of ore, which yielded $49.85 per ton, in all $1,495.50.

THE MINES.—The Redman mill, Banner Dist., started up on Tuesday on Kentuck ore, and it will next crush 200 tons from the Golden Chariot which is expected to realize from $20,000 to $25,000. At Julian the San Diego and Helvetia mines are showing some splendid rock.

SAN LUIS OBISPO COUNTY.

JOSEPHINE.—San Luis Obispo *Tribune*, July 13th: At the Josephine ore is being smelted for quicksilver, and produces a fair yield. At the Libertad some good-looking ore has been taken out, and work is being continued with a fair prospect of success.

SANTA CLARA COUNTY.

MCLEOND DIST.—Gilroy *Advocate*, July 20th: The Cold Spring Co. in opening a cut for running a tunnel, struck a vein of ore upon which they have sunk 7 ft. The ore was assayed and showed $49.02 silver, 2¼ per cent. antimony, no gold, and over 50 per cent lead, pronounced by the assayer to be good working galena. In the Gilroy Con. Co.'s claims, a vein over a foot wide is in sight in the croppings. A piece of top rock contained 71 per cent. of antimony and over $13 to the ton in gold and silver. Afterwards while prospecting the cropping a veiu of cinnabar a foot wide was discovered. Work has been commenced on this claim. The Cold Spring Co. will be incorporated and work vigorously prosecuted. Mr. Stayton is driving his tunnel in as fast as possible, and expects to drift into his deposit of cinnabar within 15 ft. Work has been commenced on the old Gomaz claim by a S. F. Co. The Condon Bros. have located a claim for cinnabar and have taken out some beautiful specimens. The above claims are about 26 milee southeast of Gilroy.

TRINITY COUNTY

COX'S BAR.—Weavervillo *Journal*, July 20th: The season is over at Cox's Bar. McElvancy & Wiltsoire's claim has paid them well, and Joh Hedges has taken out hig pay, making more this year than for several seasons past.

TUOLUMNE COUNTY.

CHUNK.—Sonora *Independent*, July 20th: A large chunk of quartz rock was found this week on the claim of Myers and Peters, in Sonora. The rock weighed 51 lbs. and is thickly studded with gold.

Nevada.

ELKO COUNTY.

THE MINES.—Elko *Iudependent*, July 13th: In Railroad Dist. the Walla Walla Chief has developed a large body of high grade ore. The Rogers from Buena Dist. Reports the discovery of a 4 ft. vein of good milling ore. The Austin Co. at Mineral Hill has resumed work on its mines and will erect a mill this Summer. At Bull Run the mines belongiug to the Chellie Co. have yielded more than fairly. At Buel it is reported that the Buel smelting works will be started up under a lease.

EUREKA DISTRICT.

SHUT DOWN.—Eureka *Sentinel*, July 19th: All of the furnaces of the Eureka Con. have heen shnt down for some days for repairs.

STAR C. M. CO'S. TUNNELS.—The Griffin tunnel is over 300 ft. long, and is 150 ft. below the surface of Freeman's Hill. The Williams' tunnel, is over 150 ft. long. It will cross 6 ledges in which there are splendid developments of ore to 75 ft.

MAONOLIA.—The indications are flattering for the development of a body of ore on the lowest level.

NEW WORKS.—L. N. Dougherty, will probably break ground next week for new reduction works of mammoth proportions. The contemplated improvements will have a tendency to liven up matters in this section.

SILVER WEST FURNACE.—Supt. Taylor is getting along splendidly with the furnaces of the Silver West Con. He will be ready to fire up in about two weeks.

ELY DIST.

BULLION.—Ely *Record*, July 14: During the past week W. F. & Co. have shipped bullion valued at $130,118.37.

Since July 1st the Pioche Co. have shipped bullion valued at $18,176.98.

The Summit shaft of the Meadow Valley Co. will soon start up.

CHIEF OF THE HILL.—Since our last review all work has been suspended in the upper portion of the mine, for the purpose of tracing out the ledge at the point where it has been cut by the Burke tunnel in running into the hill. Mr. Hardy, Supt., from surveys obtained will have to sink eight feet from the present depth of the winze on his lower level to strike the level of the tunnel where it cut his ledge, and will then have to run a drift 50 ft. west to intersect them at the point where the ledge was tapped. All other work will be suspended until this has been finished.

AZTEC.—Prospects are looking better than for the past forty ft., showing at a depth of 80 ft. a well defined ledge, from 24 to 30 inches wide, assaye from which run from $85 to $300 per ton.

MOCKINO BIRN.—The shaft is down 50 ft., with ore in the bottom constantly improving and the ledge widening as sunk upon, and much more solid. The chloride streaks mentioned in our last review as coming in on the bottom of the shaft is gradually widening, and shows from 6 to 10 inches of good free ore. During the past week assays have averaged from $60 to $250 per ton.

CONDOR.—Suspended sinking of main shaft and are running a drift east. At 5 ft. from the shaft cut into the ledge in the face of the drift, and it shows 3 ft. in width, and the ore assays as high as $231 per ton.

MEADOW VALLEY.—The Summit shaft is below the level of Fitzhugh tunnel, and the machinery, etc., is all in position.

GREY EAGLE.—Work was resumed on Friday, a contract to sink 60 ft. having been commenced at that time.

LOUISE.—The Anna Dickenson shaft, down 75 ft., shows constant improvement, with the ledge showing 4 ft. wide on bottom. The Grattan and Goodspeed shafts are also improving.

BOWERY.—The mill continues running steadily on ore from the Pioche and is in every particular a success.

NEWARK.—Timbering of shaft continues. The hoisting machinery left Palisades on the 8th inst., and is contracted to be delivered here on the 23d or 24th.

STIRLING.—Work on the new contract to sink 50 ft. was commenced on Monday, and when this is completed the shaft will be 200 ft. in depth. Assays from ore during the past week have averaged $112 and a constant improvement is noticed as the ledge is sunk upon.

WASHINGTON & CREOLE.—Still running east drift, which is in between 70 and 80 ft., and sinking the shaft. Machinery for hoisting purposes has been contracted for in S. F.

CHAPMAN.—A contract to sink the shaft 50 ft. deeper was commenced on Friday last. Stopes continue to look and yield well.

Work on the Condor mill is soon to be pushed ahead with alacrity.

INGOMAR.—In regard to the strike recently made, the ledge is improving continually, both in appearance and the quality of ore extracted.

PIOCHE.—On Thursday we visited this mine. At the first station Mr. James informed us that we were 110 ft. below the surface. A drift south to cut the ledge has been run from this point 12 ft. After conducting us through the various angles of the dips and spurs of the old ledge, we were brought to the new strike. The ledge at this point averages about 5 ft. in width, and runs nearly north and south. It was struck 205 ft. north of the shaft, although in a direct line it could not exceed 30 ft. A winze is being sunk to the second station, and is down 15 ft. We took some samples of ore from the ledge, at the bottom of this winze, had the same assayed and the result obtained was $2,327.75, and the sample was not more than average rock. The ore from the different stopes in this level is mixed before it comes to the surface, and runs about $500 to the ton.

On the second station drift to the ledge, 110 ft. in length, stoping going on and raising considerable good milling ore. The ledge is about 2½ ft. wide of good mineral, running east and west. On the 385-ft. or third station a drift had to be run 234 ft. to ledge; a drift 225 ft. east resulted in finding a body of ore 3 ft. wide, very rich; a very little water is to be found on this level.

On the fourth level, 460 ft. down, drift to ledge 300 ft., striking the ledge 625 ft. below the surface, as the ledge from the opening is pitching at about 62°. A large amount of ore is raised and much more could be if milling facilities were at hand. The Supt. is working about 45 men, eight-hour shifts, and is raising about 11 tons of ore daily.

RAYMOND & ELY.—Yesterday we visited these works; they have on the dumps near or quite 4,000 tons of third class ore, that is estimated to mill from $60 to $70 to the ton. After looking through blacksmith, carpenter and machine shops, we were lowered to the 423-ft. level. Seventy-seven feet south from the shaft the ledge was tapped, about 8 ft. in width, but with a small streak of waste rock, varying from 12 to 20 inches in width running through the center, leaving the mineral about 6½ ft. wide. They have drifted west on the ledge about 12 ft., and east 70 ft.; raising ore to 3d level by incline winze 103 ft. deep. On this level is stored some 70 tons of waste rock, which will be raised soon. The face of drifts looks much better as work advances. Mr. Clark is working over 200 men—8 hour shifts.

HUMBOLDT.

BULLION.—Unionville *Silver Slate*, July 20: Amount shipped from the Arizona since our last issue, was $4,839.

CENTRAL DIST.—Phillip Mullen has purchased the Evans & Jennings quartz mill, and is making arrangements to have it taken to Central Dist. The Teamster mine is tolerably well developed.

ADAMS MINE.—The ledge is nearly 3 ft. thick in the face of the tunnel, and samples of ore yield from $200 to $500 per ton in silver. The tunnel is in over 100 ft.

RELIEF DIST.—The news of an important strike in Relief Dist. is confirmed. The Batavia Co. struck a large body of ore in the C. P. R. R. mine, on last Monday.

REESE RIVER.

SEMANTHA.—Reese river *Reveille*, July 13: Incline being sunk on the ledge, which promises well and has good ore.

STAR OF NEVADA.—Main tunnel going ahead; but little being done elsewhere.

PRUIN & PULLIN shut down.

FLORIDA.—Prospecting continues; 8 men at work; some first rate ore coming out, but in small quantities.

LANE & FULLER.—(Pacific Co.)—Some new contracts have been let; large force employed; last month's yield from the mine being worked at the Manhattan Mill.

FREEHOLD.—On account of bad air work has been suspended on the ledge for two weeks past. An air shaft is being sunk which will soon be completed, when the extraction of ore will be resumed.

MORGAN & MUNOEY.—Ten men working in different parts of the mine; looks well at all points; ore good.

DIANA.—Shut down the first of the week.

SOUTH AMERICA.—This mine is to be started up again soon.

GROVE TUNNEL.—Turner and Co., who have a lease in the 200-ft. west level, are getting some high grade ore; mine generally looks fair.

ISABELLA.—Looks well at all points. A crushing of ore last week went $1,000 per ton.

GIRARD.—Work progresses slowly; a little good ore coming out.

SAYBROOK.—Good ore coming from the 150-ft. level.

DOLLARHIDE INCLINE.—Shut down.

OREGON SHAFT.—Heavy work going on, lots of ore in the mine; large number of men employed.

SARATOOA—Continues good; sent 45 tons of beautiful ore to the mill yesterday.

IRONCLAD.—Work suspended.

CAMAROO.—Shut down.

YANKEE BLADE — KLING & KELLEY.—Been raising an air chute for 6 weeks past. Now stoping at the 150 ft. level; ore fair.

SLOAN & COOPER.—Sinking incline on the ledge; down about 80 ft.; some of the ore coming out is first-class.

ENSIGN & SOUTHALL.—Getting good ore from their incline.

VIRGINIA.—Running a new tunnel to cut the ledge at a greater depth.

PATRIOT.—Sinking from the tunnel and getting good ore.

WASHOE.

SAVAGE.—LOCAL SUMMARY—Gold Hill *News*, July 20: Daily yield 170 tons, worth $28. Last Sunday evening a very fine appearing body of ore was struck in the east cross-cut of the south drift on the 1,500-ft. level.

The indications thus far are certainly flattering for finding a good body of ore on this level, but the development as yet shows nothing better than ore of a low grade, assaying from $15 to $30 per ton. Sinking the main incline is progressing a little slower than at our last report, the rock being somewhat harder. It is down about 90 ft. below the 1,500-ft. level.

OPHIR.—The work of repairing the 700-ft. level is completed, and a drift running west from a point 360 ft. north of the main west tunnel has just been started.

WOONVILLE.—Yielding about 35 tons of ore per day. All the levels and ore breasts are looking splendidly, and the ore coming out is the best yet produced from the mine. The Thompson & Ramsdell mill will start up on ore from this mine next Tuesday, and before the end of the week still another mill.

BELCHER.—Daily yield, 275 tons. The cave in the Crown Point mine did not effect the Belcher, heinging 100 ft. north of it. The 1,000-ft level is looking splendidly. The main incline has about 50 ft. further to go to meet the drift west from the 1,100-ft. level.

CHOLLAR-POTOSI.—Daily yield 200 tons, worth $42 per ton, principally from the Belvidere and Blue Wing sections. Repairing the shaft is completed to about 800 ft. below the surface.

CONS. VIRGINIA.—The main drift on the 1,163 ft. level from the Gonld & Curry shaft is in 100 ft. north of the south line of the Cons. From this point it is the intention to immediately start a cross-cut west for the main ledge. Crosscuts are started both east and west at the extreme south end of the south drift at the 500-ft. level, drifting through fine bodies of low-grade ore each way.

JUSTICE.—The new pumping machinery keeps the water out, and drifting to the east is actively prosecuted, with prospect of having good ore soon. The north drift from the south shaft is in 200 ft. showing good milling ore throughout.

YELLOW JACKET.—Daily yield 25 tons. The drift north at the 1,300-ft. level is progressing well.

IMPERIAL-EMPIRE.—The new ore-body at the 1,650-ft. level has widened out to 12 ft., and assays from the face of the drift this morning yielded as high as $180 to the ton.

JACON LITTLE.—A large amount of excellent grade ore is ont on the dump ready to be hauled to mill, and the ledge shows plenty more of the same.

OVERMAN.—Shaft down to 1,100-ft. level, and station at that point being opened. The main west drift is in 425 ft. running through ledge matter with good indications in the face.

SILVER HILL.—The new hoisting works are in full operation, the shaft is bailed out and enlarged for the first 100 ft. of its depth, and the first or 100-ft. level is opened, a drift being run from the shaft nearly to the ledge, which it will intersect about 40 ft. from the shaft, where good ore is anticipated.

BUCKEYE.—Sinking the main incline deeper is progressing well, although in hard porphyry. The ore breasts are looking and yielding well, and the last run of 170 tons yielding $2,950. The south stopes are looking especially well and showing improvement.

HALE & NORBROSS.—Daily yield about 50 tons of ore. The incline is down 60 ft. below the 1,500 ft. level, in fair sinking ground. Prospecting at the 1,500-ft. level is actively continued.

SIERRA NEVADA.—Daily yield 40 tons, keeping the mill steadily running. A good little streak of ore, about 4 ft. wide, was found in the lower part of the mine a few days ago, which promises well.

KNICKERBOCKER.—New shaft down 400 ft., and sinking suspended until the 400-ft. station can be put in, when sinking will be resumed.

DANEY.—Shaft down 110 ft. below the 500-ft. level, and sinking somewhat impeded by increase of water. The drifts at the 500-ft. level are in favorable indications yet.

SUTRO TUNNEL.—Total length, 2,968 feet.

GOULD & CURRY.—Drifting at the new lower levels opened, is actively prosecuted with no very favorable developments as yet. The main incline is down 100 ft. below the lower level.

KENTUCK.—Daily yield about 60 tons from the old workings.

OCCIDENTAL.—The contract drift, north, is in 118 ft., and almost the entire distance in good milling ore.

CALEDONIA.—Sinking the shaft is suspended at present, and the 700-ft. level is being opened. Prospecting in other parts of the mine is actively progressing.

BALTIMORE.—New shaft down 165 ft. The ground works well and some little water is coming in.

UTAH.—The hoisting works are completed, and everything in splendid running order. Sinking the shaft deeper is resumed with vigor.

RED JACKET.—This mine is yielding some very fine ore which assays very rich. The pay streak is about 2 ft. wide, and widens as sunk upon.

WHITE PINE.

TREASURE HILL MINES.—White Pine *News*, July 13th: O. H. Treasure. The ore in the lower tunnel has improved since last report. Work in the Wheeler tunnel progreseing rapidly, with good indications in sight. The Big Smoky mill is running steadily on ore from the Co's. mine.

PENNSYLVANIA.—The formation in the shaft has changed favorably since last reported.

SAN JUAN DEL RIO.—Contractors working day and night sinking in ledge matter. A good character of ore is in sight in the bottom of the shaft.

HAMILTON M. & M. Co.—The mill of the Co. started up to-day, to test the machinery. The mines of the Co. have changed for the better since last reported. North Emersly and Othello are looking well.

EBERHARDT & AURORA Co.'s MINES.—The mines of the English Co. are improving daily, in all the works. The De Pase chamber is showing a breast of ore 35 ft. wide, and promises to excel in richness and extent any deposit of ore yet found on Treasure Hill.

BEECHER CON. M. & M. Co.—Working East from the Old chamber, in good ore. Have in sight a body of ore large enough to keep the Manhattan mill running steadily. The Edgar mine, will when the whim is complete, be worked with a full force of men.

SUNBEAM.—The Moscow shaft is down 75 ft. in good ore. The East and West drifts are pushed ahead with energy, and ore improving daily.

EAST SHEBOYOAN.—Ore of good grade is obtained in Exchange drift. A part of the force of men is employed in the southwest drift, running into the hill, and showing a fine body of fair milling ore.

COPPER GLANCE,—Work goes ahead by contract. Good progress is made in the northwest drift and north shaft. A good quality of ore is coming out.

[Continued on page 60.]

The Pacific Coast and San Francisco.

The fntnre greatness of San Francisco will depend mainly upon the thrift and general prosperity of the iuterior, and the development of its vast resources. The physical conformation of the State, with its two great interior valleys and system of rivers, natnrally make a large part of California directly tributary to Ssn Francisco in the disposition of its already large and rapidly increasing commerce. The coast range of mountains completely shutting in this commerce from the sea, at all central points except at the Golden Gate, gives to San Franoisco an advantage of position hardly equalled by any other sea port in the world.

Now with this great advantage in her hands, Sau Francisco, that has been built np in a great measure hy the power and quickening impulses of vast streams of gold and agricultural products, wrought from the hard rocks and soils by the will and nerve of a mining and rural population, should now in turn lend a helping hsnd, in aid of a continuance of these tributary streams of wealth.

Agriculture and Mining.

The great agricultural interest ie hampered in its progress by the want of more railroads, and San Francisco should help hnild them. Innumerable mines of nntold wealth, yet lie nndeveloped in all the vast ranges of the Sierras, and the money of San Francisco should be freely given to nnfold their riches, or to the hnilding of roads, making them accessible, that the very riohes they contain may be in turn more easily ponred into the lap of the mistress of the commerce of the Pacifio seas.

The iron we are consnming year by year, at the cost of millions of dollars, should be wrought out of onr owu mines by San Francisco capital, keeping our money at home and giving employment to thonsauds now here, and to thousands more who stand ready to come whenever capital will give them the work to do.

The Power of San Francisco.

San Francisco by the great vote ehe wields, now carries a moral power for good or evil to the yet undeveloped interior, that shonld he felt on the side of right and justice. She ehould use her vote and her influence in the advancement of edncation, liberally allowing the publio school moneys to find their way among the valleys, among the mines and recesses of the monntains, nntil their population shall be as renowned for intelligenoe as are they of Switzerland.

We want her power for good, hut not in aid of another gigantic lottery by which to wring ont the last dollar from an already purse depleted people. San Franciscans are ahle by their influence to *break up*, instead of bnilding up, monopolies and "rings" for crnshing the struggling energies of a people, who have to a great extent given them or contrihnted to the wealth and power they now possess; and San Francisco should lead in doing it.

Low Freights and Fares.

They shonld aid in establishing a system of low freights and low fares, that the produce of the interior can be placed on shipboard for exportation withont ahsorbing the entire profit of cnlture and production. Give us a free port, inviting the merchant fleets of the world to our shores, if needs be, that we may have transportation at something less than absolutely ruinous rates. Give us low fares that all may visit now and then the seat of so much wealth and power.

It is simply strange that the people of San Francisco while talking through a committee of one hundred on the subject of a trans-continental railroad, by which San Francisco is to be particularly benefitted, cannot see the need of a strong and earnest competition or opposition transit line of communication by rail or steamer between the bay city and interior places. Not an opposition to he honght off or trifled with, but one tbat would assure to the people of the interior a passage to and from San Francisco at a moderate cost.

Relativs Conditions Changed.

In the strange, wild days of '49, the mining counties with their teeming popnlation of gold seekers, swayed the destinies of the State, controlled the election of her offioers and held a taut rein upon the "cow counties" and their cities. El Dorado county alone, giving a larger vote than the city of San Francisco; and giving rise to prejndices and jealousies not altogether unfounded, which engendered a bitterness of feeling.

But time has wrought its changes, snd now the "cow counties" rule, whilst San Francisco alone, casts a full third of the entire vote of the State. With the growth of her power, should he the throwing off of old prejudices against the interior, and in its stead should he exercised a magnanimity in keeping with her great and unprecedented prosperity.

A New Class of People.

San Franciscans should throw off some of their exclusiveness; mingle more with the people of the interior; see how greatly they differ, the men and merchants of the present, from those of '49; visit them at their homes; enter with spirit into the enterprises that are projected for the general good of the people; give them hanks, where money can be had on good security at a reasonable rate of interest; or, take a hand in some of the vast schemes for irrigating the otherwise half productive lands of the great valleys, that cannot hut serve to enrich alike the prosecutors, country and the city; loan a part of your great wealth, for the building np of manufactories, and to responsihle young men, who are ready to engage for a term of years, in the breeding and rearing of sheep and the Cashmere goat, throughout the length and breath of the great western watershed of the Sierras.

Then let our snccessfnl Metropolitan merchants reach out their hands in aid of the interior, and find pleaeure in investing their earnings on this coast instead of retiring to what they term their (Eastern) "homes." By so doing, they will soon find the false prejudice of the interior broken down, and a genuine satisfaction awarded to them, and to their everlasting memory.

The time is not distaut when this city will extend for miles over the entire peninsular. But this cannot occur until the uncalled for animosity existing between the Bay City and interior are hlotted out. Not until her vast fields at her back become an empire hesming with life throughout, with a population numbering from a million npwards, of the most intelligent and progressive people on the face of the earth—a chosen popnlation, as it were, from the fonr quarters of the globe.

Notabls Examples.

Do what Chicago has done; cause railroads to radiate from the city in every direction in which there is land, to hold them np, and if there is uo land bnild hridges, make a foundation of something, so that the great northern half of the State can get to the city without heing ohliged to swim, or go a hundred miles out of the way to get there on land.

If you hav'nt enough of good water to drink, go to work and get it, there is enough in Lake Tahoe; and if the water of your rivers don't run the right way to suit your oonvenienoe, do again as the Chicagosns have done, turn it round and make it run the other way. Have some "snap," and let the result of it be seen in the increased facilities for communication with the interior; and not let another little trio of Sacramento country merchants turn a "Dutch Flat swindle" into a grand transcontinental railway right before your eyes, withont taking a dollar of the stock except what is wrung out of yon hy the nerve, effort, influence, and good sense of a few comprehensive minds.

A Singls Exception.

San Francisco does present one notable instauce of enterprise and thoughtfulness in reference to the wants of the interior. It is found in the vast scheme, now in the process of accomplishment, for the reclamation of the half snbmerged lands and islands at the confluence of the Sacramento and San Joaquin rivers. But there should be more men in Sau Francisco, with their large wealth, ready to embark in other great and paying enterprises, as were the men of the Reclamation Company.

There should be found men ready to assist in bringing out new machinery and appliances for levee building, ditching and steam plowing; helping the poor but intelligent and scientific inventor, at least to the hread he needs, while putting the conceptions of his hard worked hrain into practical shape for the good of mankind.

Steamship Lines.

It is not time yet or becoming in San Francisco to rest upon her laurels of already accumulated wealth; it is too early in the history of the world's progress for her to do so now, just as new and vast fields of promising enterprise are opening to her embrace. She should let the world see that she is ahle to hold the power she has herself created over the commerce of the seas, and which is yet entirely within her grasp.

San Francisco is able to thread the Pacific with steamship lines connecting her with Japan, China, Australia and the Islands of the great Pacific seas, and should do it. Should make the entire coast from Panama to Behring Straits, and from thence to the Amoor, and on to the lower coast line of Hindostan, and then sweeping round the great archipelago of the Pacific, make all trihutary to the queen city of the sunset shore, and center witbin her golden portals the wealth and commerce of the world.

Animalculæ in the Mouth.

Some of our readers may not be aware that the teeth and gums, when not properly cared for, are subject to the presence of innumerable forms of animalculæ.

MICROSCOPIC FORMS OF LIFE IN THE HUMAN MOUTH.

Dirt and filth and decay always breed animalculæ, and not unfrequently larger and more diegusting forms of animal life. Probahly all of our readers are aware of this fact; but that neglect of the *mouth* is followed by such results perhaps has never occured to many; yet such is the fact.

Every time we eat, more or less of onr food adheres to the teeth or is deposited between them, or upon the gums. Now if this matter is not removed, at least once a day, hy thoroughly brushing or cleansing the teeth and gnms, it sours by the heat of the mouth, and furnishes a favorable breeding place for innumerable microscopic animals, the germs of which we inhale with our breath or take into the mouth with onr food. These animalculæ, when placed under a powerful glass, appear in great numhers and in almost all imaginable forms, resembling snakes, worms, snails, etc. Upwards of thirty different species of these cnrions little forms are quite faithfully represented in the accompanying illuetration, many of which are disgusting enough when magnified so that we can get a fair idea of what they are, and their habits. Scrape off a little of the tartar or other matter which adheres strongly to the teeth, and which has been for some time subjected to the naturs1 heat of the system, and place a small piece, not larger than the head of a pin, under a powerful microscope and you will never feel like eating until you have first cleaned your teeth and thoroughly rinsed your mouth. If these minute organisms are suffered to remain for any considerable time, they commence feeding upon the gnms, which soon turn red, become sore and hleed at the slightest touch. Even the enamel or smooth ivory surface of the teeth not unfrequently become corroded, is broken, and the teeth decay and ache, to the great annoyance and suffering of the possessor.

We trust that all onr resders who are not already doing so, will, after reading this, get into the habit of regularly and thoroughly cleansing their teeth aud mouths after eating, using soap freely. If they have no brush, use a small rag, or if that cannot be had, use the finger, and afterward thoroughly rinse the mouth. By so doing you will add greatly to your general hsalth, be repaid by sweet breath, clean, healthy, good looking teeth and gums, and the microscopist will search in vain for the disgusting forms of animal life which we have depicted ahove.

The Effect of Strikes on Commerce.

All the commercisl papers of America are now discussing the effects of the recent great strike in New York. The majority regard strikes as an nnmitigated nuisance, and ae greatly hurtful to the industrial interests of the nation; hut the minority, including some first-class journals, take qnite a different view of the matter. They regard the workmen ae completely justified, and charge the great hanking concerns and the capitalists with the usurions rates of intereet that they exact as heing the real *impedimenta* in the way of progrese. We have not here to do with either, we have not to question whether the strikers are right or wrong—we consider merely the effect on the world's commerce. Hitherto the United States cannot he said to have had sny foreign commerce worthy of the name. One reason was, that they had no manufactured goode which they could sell; another, and one having very considerahle influence, of late yesrs, wae, that the high pricee of lahor made our manufacturee too dear, and that England and France could from this reason undersell us in the markete of the world. This last condition of things is heing wholly changed, and that through the medium of strikes. The price of lahor ie heing raised and a reduction of the houre of lahor effected all over the old world, principally in the great manufacturing countriee. The movement thue hegun will continue until the price of lahor and the honrs of working hecome the same in all parts of civilized Europe and America.

The advancing intelligence of workmen the world over, is making them see that their intereste are everywhere the same, therefore when they etrike, they strike in unison. Thouesnde of dollsrs came from the treaenriee of Englieh trade eocieties during the strike which is ahout heing terminated, to aseist their affiliated societiee on this eide of the Atlantic. Whatever affects a particular trade in one country, will affect it in every other. If, therefore, the American strike had eucceeded univereally, it would in eix months have heen followed hy a gigantic strike in Europe. As we have hefore stated, the reeult of all this would he to aseimilate the cost of production in Europe and America, and thereby we would he vastly the gainers. We could then without fear throw off the restrictions on commerce imposed hy the heavy duties still existing, and we could compete with England and France, on every land and on every sea. The eight-hour movement would not eventnally have raieed prices in America, the manufacturers would have to he contented with smaller profite. It would have heen a positive henefit to this coset to have had it eucceed. For combined with it wae, in many inetances, a strike for higher wagee, and we have suffered from the circumetance of paying higher wages than in the East, thus being unable to compete with Eastern manufacturers, even on our own ground. In fine, etrikes hy tending to eqnalize the cost of production everywhere, result in preventing particular nations having a monopoly of the commerce of the world.

Coffee rises in price all the time notwithetanding the reduction of the duty, and will continue to rise. It ie said that this reduction will cause an increased consumption; this however we do not helieve, hut the consumption of coffee is increasing per head year hy year, the heverage coming into more general use. The eupplice from all the producing countries have heen less than ever, thst of Java not being more than 50 per cent. of last year, and that from Ceylon only eix-seventhe. The statietics of the Java crop this year are: Government, 50,589,220 lbs.; private, 8,614,309 lbs.; total, 59,203,309 lbs. The Brazilian crop has suffered from a hot and dry summer and excessive rains.

Tea Importations into San Francisco.—In 1870 only 2,250 tons of tea were imported into this city. During 1871, not less than 8,250 tons were imported; while the estimate for the present year is 15,000 tons, and as soon as we get a competing overland road the amount can scarcely be estimated.

Immigration at the West.—The State of Missouri has increased over 1,100,000 hy immigration since the war closed; while immigrante are pouring into Kansas at the rate of ahout 125,000 persons a year. This ie what comes of cheap lands, cheap living, chesp freights and the ahsence of monopolies.

Useful Information.

Sharpening Edge Tools.

There is a common saying that a good workmaa is know by his tools, and it is certain that many a young mechanic is hiadered in acquiring skill in his trade by too littls attention to this excellent maxim. Tbe followiag simple rules, from the *Young Mechanic*, will be of aid to inexperienced workmea, and, perhaps, to some older in the profession, in telling how tools should bo treated:

Tbere is no operation in which tbe young mecbanic is so much at fault as in that of grinding and setting in order tho various tools he has to ase. Nevertheless, he will never become either an independent workman, or a good one, if he has to depend upon others for this necessary labor.

No doubt, to sharpen a tool which is in very bad order, is a tedious and tiresome job; but it is not so wearisome an affair to keep tools in condition for work, after they bave been once thoroughly sharpened, by one who nnderstands how to do it. Never, therefore, use a bluat tool but at once go to the hono or grindstone with it, and put it in first-rate order. Time thus employed is never wasted, but rather saved; and tbe rcsnlt will appear invariably in the work whicb you are eagaged upon. You must, in the first place, understand precisely what it is you havo to do; and althongh the following details may be by eome considered more adapted for advaaced students than for young mschanics, a little attention to the explanations will render the matter clear to any boy of ags and intelligence to take in hand, with reasonable prospect of success, the tools of the carpenter, turner, and fitter.

Now all tools, if *well* ground, are ground to a certain know angle, according to tbe material which tbey aro intended to cut. Tools intended to cut soft woods, like deal, ars ground to an angle of twenty or thirty degrees, like tbe chisel seen edgwise. I shall have a word to say presently as to the direction in which snch tools are to be held in order to make them cut as well as possihle. A tool for hard wood is ground to an angle of at least forty, and it ranges up to eighty degrees, giving a stronger, thicker edge, but not so keen a ons. We have, therefore, mors of a scraping tool than a cutting one, at lsast, in the way it is usually held. Then we come to ths tools with which iron is tnrnsd, and steel also. Tbe usual angle is sixty, thence it ranges to ninety degress. Thus, yon see, advancing from soft wood tools to those for hard wood, and thence to a substanco still harder, we have increased the angle of the edge, beginning at thirty and ending with cighty or ninety degrees. But now we come to a material which is harder than wood, and not so hard as iron, yet we uss tools with an angle of ninety degrees, which is still greater, and ssventy degrees is the least angle ever used for this metal.

Experience only has taught the proper angles for tools, and it is found that if brass and gun metal are turned with tools of a less angle than seventy degrees, they only catch into the material, and do not work at all satisfactorily. You can, however, *scrape* brass, as a finish, with the thin edge of a common chisel; bnt there the tool is held so as to scrape very lightly and polish, and its edge will not remain many minutes, unless the maker (intending it to be so used) has made it much harder than he would make it for soft wood cutting.

If you buy your tools at any *good* shop, you will find that tbey are already ground to nearly the angles named, and when you rs-grind them you must endeavor to keep thsm to the same. The *bevel*, as it is called, of many tools nsed not be gronnd at all, as they may be sharpened solely by rubbing the upper face on a hone, or grinding it, holding it so that the stone sball act cqually on all parts of it. If, however, the tool should become notched, you must grind the bevel of it, and then you mnst try and keep the intended angle.

One tool, however, or, rather, ons pair of tools, viz., turning-gouges and chisels, are very seldom ground with a sufficiently long bevel wben they first come from the make. This you must correct when you first grind ths tools for use, and keep the same long bevel and small angle of edge continually afterwards, for you will nsver make good work on soft wood if your chisels and gouges are ground with two short a bevel. I must also guard you against another common error, which, howsvsr, is difficult to avoid at first, and only long practice will onable you to overcome it. The bevel of *all* tools must be kept flat and even, and whsn the tool is afterward ruhbed on the oil stone to give a finish to the edge, another flat even bevsl sbould be made.

Voracity of the Pickerel.—The rapid growth aud extraordinary voracity of the pickersl are well shown by Dr. Sturtevant in the report of the Massachusetts Inland Fisheries Commissioners. Tbs doctor investigated their powers of eating in the following manner:—He put two young pickerel, five inches long, in a trough with a great quantity of little minnows about one inch in leugth; and these two pickerel ate 128 minnows the first day, 132 the second, and 150 the third, and tbey increased one inch in 48 hours! They were mere machines for the assimilation of other organisms. It is to be hoped that this wolf of the waters may nsvsr be introduced into our California streams.

The Development of the Lobster.

According to Mr. S. J. Smith, in the *American Journal of Science*, the first stage of larval life finds the littls animal a free swimming schizopod, abont a third of an inch long, without any abdominal appendages and with six pair of legs, to which are attached powerful swimming organs. The eyes are brigbt blue, and the body is orange to reddisb orange in color. The stage shows an increase in the size of tbe little second animal, and a development of a portion of the abdominal legs, witb other and less important changes. In tho third stage observed, the animal has becoms half an inch loug. tbe anterior legs have largely increased in size, the second and third pairs are furnished with claws, the abdominal appendages bave become conspicuous, and the "pocksts" have appeared, though they yet differ from those observed in the adult. The fourth stage finds the yonng lobster threo fifths of an inch long. It has lost its schizopodal features and has become to all intents and purposes, an actual lobster.

It is still, however, a free swimming animal, moviag through the water very rapidly by means of the abdominal appendages, and dartiag backward when disturbed, with the tail, frequently jumping out of the water like a shrimp. It is probable that there is yet another stage of development before the complete lobster is reached. From the data obtained, it is also probable that these changes all take place in the course of a single season.

The Time Planets Would Take to Fall into the Sun.—M. Flammarion makes the following remarks, on this subject, in *Les Mondes:* Supposing the Earth to be arrested in its course, and tbe centrifugal force thus destroyed, the Earth, heing left to the first force, would fall to the sun with a uniformly accslcrated motion. It wonld take about 64 days in its fall, and would reach the sun with the incouceivabls velocity of about 360 miles for the last second.

The following are the figures obtained from a calculation of the tims the planets would take to fall to tbe center of the snn, supposing their motion to be arrested.

Mercury	15 55 days.
Venus	39-73 "
Earth	64-57 "
Mars	121-44 "
Jupiter	765-87 "
Saturn	1901-93 "
Uranus	5424-57 "
Neptune	10623-73 "

Increase of Tea Drinking.—A late number of the London *Grocer* publishes the tea statistics of the United Kingdom for the ssventy years. In 1801, the quantity of tea consumed was 11,865 tons, the avsrage price of which was four shillings two pence half penny per pound, making the yearly amount drunk by each person (man, woman and child) in the Kingdom, average one pound eight ounces.

In 1871, the consumption had risen to 61,701 tons, but the price had fallen to one shilling, ten and a half pence per pound. The taste for tea appears to have increased in the same ratio as its cost decreased, as in the last mentioned year the average of each individual was three pounds fifteen ounces.

Facts about Tacks.—The length of tacks, as nnderstood and given by the manufacturers, is by the "ounce," which is printed on the label, and stenciled on the box or package in which the goods ars placed for transportation. "Three ounce" (3 oz.) means that the package so labeled contains tacks three-eights inch long and that for every three ounces of tacks of that length there should be 1,000 tacks. Four ounce would be ssven-sixteenths inch long; six ounces,-eight sixteenths; eight ounce, nine-sixteenths inch long, and for each "full-weight" package thus labeled there should be 1,000 tacks, and so on up to twenty-four ounce, which likewise is equivalent to one and a quarter inches long, and 1,000 tacks.

Professor Gunning claims that the Niagara river has been in existence about 200,000 years—that a barrier thirty feet high at the head of the rapids would throw the water back into Lake Michigan. He accounts for the drainage of the lakes before the formation of the river by a channel which extended from Lake Michigan to the Mississippi.

Improved Letter Envelope.—An improved Lettsr envelope has bsen patented, which might be very useful to forgetful persons. The improvement consists in an external pocket, in which, supposing the envelope has already been sealed, anything forgotten may be placed, and also sealed up and carried with equal safety, and the necessity of destroying an envelope avoided. The only difference in the envelope is in the cut of the paper, and no additional cost is entailed in the manufacture.

Among the best conductors of sound are iron and glass. Through them sound is transmitted at the rate of 17,500 feet, or over three miles per second. But in air sound travels only 13 miles per minute, or, 1,142 fest per second.

There are about four hundred species of minerals known; but the varieties of these species are almost infinite. For example, carbonate of lime exists as chalk, marble, spar, lithographic stone, etc.

Foul Air in wells, drains, etc., may he effectually dissipated by dashing in a few buckets of water, mixed with a small quantity of chloride of lime.

Good Health.

The Small-Pox Invasion.

The scare with regard to the present small-pox invasion in this city and State, seems happily to be fast passing away; the menace, however, will not have been without its beneficial effect by indncing another general vaccination and re-vaccination of our people—a emedy, which, if universally resorted to every few years, witb tbe prompt vaccination of infants, wonld render it impossible for the small-pox to become a serious evil in any community. In reference to the

Prevealion of Small-Pox.

Dr. Armstrong in the Canada *Lancet*, advises tbe following means in staying the ravages of small-pox: "Pereons snffering from the discase should daily anoint their bodies and limbs throughout with carbolized oil; and also wash their bodies thoronghly with soft water, slightly carbolized; the anointing to be performed after the whole person has been washed, and gently dried with somo soft fabric. This process should be commenced before patients are allowed to leave their sick-room, and continued until snch time as all the diseased skin has been removed, aad a new and healthy one formed. In this way the particles of diseased and desquamated skin are prevented from heing set free from persons who have recently suffered, and contaminating healthy persons, by being inhaled or deposited on the exposed skin, or by getting into the water or food, and thus hs a mode of contagion."

"The attempt to prevent its spread by yellow flags, isolation and non-interconrse," says tbe Pacific *Medical Journal*, "will prove ineffectual. While some good may result from such measures, in the way of checking its extension in one direction, tbey are capable of doing much evil by diverting attentiou of the only sure defenss, and creating a false sscurity in the public mind."

Vacciaatioa as a Cure of Small-Pox.

Mr. R. C. Furley, in a letter to the *Scotsman*, says he is able to prove that vaccination is not only a preventative of disease but a cure. It is, he says, ascertained that when a psrson liable to take small-pox is exposed to the infection, the poison circulates in the blood for eight days before producing any febrile symptoms; then commence headache, sicknsss, pain in the back, suffused eyes, and a particularly white-furred tougue— a group of symptoms that belong to no other disease, and which lasts for three days. It has been held and acted on since Jenner's great discovery, more than eighty years ago, that it is not only wrong but fatal to vaccinate any one during that stage of disease, or the subsequent one when the eruption makes its appearance. But Mr. Furley says he can show from cases under his care at ths present time that if you vaccinate during the febrile stage the fever is slightly increased, but the eruption does not make its appearance, and if you vaccinate during the eruptive stage the eruption is immediately arrested. The matnre lymph overtakes the immature poison, and the disease terminates. If the eruption has gone the lsngth of having white tops, there is danger of infection; if not, it dies away as pimples. Mr. Furley feels confident that if evsry doctor were to vaccinate each case of small-pox that comes under his care at once, many hundred of lives would be sparsd and many thousand of pounds would be saved. In the mean time, he invites members of ths medical profession to accompany him among the patients he has under his cars, and thus possibly stamp out the epidemic in a few weeks.

Tea Drunkards.—Dr. Arlidge, of the pottery inspectors in Staffordshire, England, has put forth a very sensible protest, says the *Lancet*, against a very pernicious custom which rarely receives sufficient attention, either from the medical profession or the public. He says that the women of the working classes make tea a principal article of diet instead of an occasinal beverage; they drink it sevsral times a day, and the result is a lamentable amount of sickness. Dr. Arlidge remarks that a portion of the reforming zeal which keeps up such a fierce agitation against intoxicating drinks might advantageously be diverted to the repression of this very serious evil of tea tippling among the poorer classes. Tsa, in anything beyond modsrate quantities, is as distiuctly a narcotic poison as is opium or alcohol. It is capabls of ruining the digestion, of snfeebling and disordering the heart's action, and of generally shattering the nerves. And it must be remembered that not merely is it a question of narcotic excess, but the enormous quantity of bot watsr which tea bibbers necessarially take is exceedingly prejudicial both to digestion and nutrition.

Cod-Liver Oil Pills.—Dr. Van der Court, of Brussels, prepares cod-liver oil by adding carefully pulverized slacked lime to the oil, little by little, until the consistency requisite for forming into pills is obtained. Of this mass he gives four or five grains as a dose, after each meal, flavoring it witb a small quautity of oil of bitter almonds, or other substance. This remedy he considers to be in many respects better than the liquid oil, and quite useful in the early stages of consumption. The more chronic the character of the disease, the more good may be expected from its administration.

Sleep and Dreams.

Professor Humphrey, the distinguished physiologist of Cambridge, England, has given his views of the physiology of sleep, dreams and cerebral action, in a lecture befors the Roya Institution. He assumes that the npper regions of the brain are those which minister to the higher mental operations, consciousness, volition and reason, while the basal portions are more immediately connected with the operatioas of life. Ths cause of sleep ho holds to he a slight deterioration of the tissues which resnlts from their functional activity dnring the day, and is carried so far as to interfere with the higher and more cerebral operations, and which necessitates protracted rest for the recovery of the nutritive halance. Dreaming he regards not as a normal or healthy accompaniment of sleep, but as a result of the abnormal or imperfect coadition of the organ of mental action. In the natural state, he says, we should pass from wakefulness to complete unconsciousness, and vice versa, almost instantaneously, and many persons do so. But more frequently the transitiou is protracted, and stages are observed in which the sleep is but partial. The cerebral organ being in an imperfect state, its action is imperfect, and the first effect of the lessening of ita vital vigor is a loss of the highest form of mental power—the control over the mental operations. This requires the highest mental effort, and is most easily lost. In this condition the thoughts ramble unchecked, chase one another confusedly over the mental field, and give rise to all sorts of incongruities of the imagination. At the same time being unrestrained, thsy are excited, and evince efforts of memory and even of combination, of which in the regulated etate of wakefulness they ars quite incapabls. In this way ths image of persons and places, events and items of knowledge, long torgotten in the ordinary state are recalled with distinctness, and we fancy that new information has been acquired, when it is only forgottsn facts that are recalled.—*Galaxy.*

Poisonous Mussels.—A sea-side correspondent of the *Alta*, says: "The mussel is large, and at certain seasons is very palatable, but at the present writing they breed, and then sickness is the result of eating them—death resulting in a great many cases. A bottle of sweet oil is the most effectnal remedy. In one case, where an individual had eaten mussels after boing warned, he described the feeling as if he was as light as a feather, in fact he held himself down on his bed in order to keep himself from flying to the roof of the house. He said it seemed to him that his head was twice its usnal size, and in fact his whole frame had doubled in proportion, but still a feeling of lightness, not at all in conformity with his bulk, seemed to him to exist."

Earth Poultices for Poisonous Bites.—A correspondent of the *Scientific American* suggests that a poultice of clay or common swamp or gutter mud should be applied as soon as possible to the bites of reptiles, or stings of insects, etc. The correspondent says he has successfully tried it upon himself. In one case hs was stung by a numerous swarm of the yellow hornets in many places in his neck and arms. He went to a swamp near, the poison being so severe that his sight was much affected. He immediately applied the mnd, and, in half an hour, he went to mowing again, with only a small sore lump round each sting. He knew a neighbor who was bitten by a rattlesnake some miles from home; his companion left him and went for help as fast as possible, it being just night. He was not able to return until morning. When going, he met tho man returning, with the poison conquered. He had got to a swamp, dng a hole, inserted and buried the bittsn place in the mud. That was all.

Spread and Extent of Intemperance.—A report on this subject recently made to the Legislature of Massachusetts, estimates that there are 600,000 persons in the United States who have lost their power of controlling the appstite for intoxicating liquors, and that in Massachusetts thers ars 23,000 of that class, of whom two psr cent. die yearly through drunkeness. In Europe, statesmen are already alarmed at the progress of the vics, and the increasing consumption of liquors. The governments of France and England are agitated on the snbject. The *Medical Press* is also discnssing the subject from tbe sanitary as well as moral and economic stand point.

Sun-Stroke and Heat in New York.—The first week of July, 1872, will bs made memorable in the mortuary annals of New York for the unprecedented number of deaths from all causes, but notably so for the mortality from sun-stroke. The unprecedentsd numbsr of 184 deaths from sun-stroke alone, were registered during that week; while the deaths from all causes during the first six days only were 1,348—more than double ths usual average for the corresponding period for ssveral years previous.

Dr. Angus Smith gives a good rule for ascertaining the amount of carbonic acid in the air of houses: "Let us keep our rooms so that the air does not give a precipitate whsn a 10½ ounce bottleful is shaken with half an ounce of clear lime water," a sanitary regulation which can easily bs carried out.

MINING AND SCIENTIFIC PRESS.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY, GEO. H. STRONG,
W. B. EWER, JNO. L. BOONE.

Office, No. 338 Montgomery St., S. E. Corner of California St., diagonally across from Wells, Fargo & Co.'s.

SUBSCRIPTION AND ADVERTISING RATES.

ADVERTISING RATES.—1 *week*. 1 *month*. 3 *months*. 1 *year*.

Per line.....	.25	.80	$2.00	$5.00
One-half inch.....	$1.00	$3.00	7.50	20.00
One inch.....	2.00	5.00	14.00	38.00

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper, inserted at special rates.

SUBSCRIPTIONS payable in advance—For one year, $4; six months, $2.50; three months, $1.25. Clubs of ten names or more, $3 each per annum. $5, in advance, will pay for 1½ year. Remittances by registered letters or P. O. orders at our risk.

English and Colonial subscriptions, post paid, per year, £1 3s.; 6 months, 12s. Advertisements, per line, first insertion, 1s.; subsequent insertions, each, 3d. Large advertisements at special rates.

ILLUSTRATIONS AND REPORTS OF MINING ENTERPRISES WANTED.—Drawings or photographs of mining works that are of general interest to our readers are solicited for publication in this journal. Official reports of Companies, and description of mines of importance, of special interest, are also desired. Sketches of any new method and discoveries will be very acceptable.

San Francisco:

Saturday Morning, July 27, 1872.

Gold and Legal Tender Rates.

SAN FRANCISCO, Thursday, July 25, 1872.—Legal Tenders buying, 87¾; selling, 88¼. Gold in New York to-day, 114⅛.

Table of Contents.

ILLUSTRATIONS.—Canal Boat Propulsion, 49. Microscopic Forms of Life in the Human Mouth, 54. Gold in Upper Burmah, 56. The Eureka Pump, 57.

EDITORIALS.—Fire Damp from Anthracite; The Academy of Sciences, 49. The Pacific Coast and San Francisco; The Effect of Strikes on Commerce, 54. The Presidency of the California State University, 56. New Silver Mines; Peruvian Railroads, 57.

CORRESPONDENCE.—Notes of Trsvel in Lander County, Nevada, 50-51.

SCIENTIFIC PROGRESS.—Vegetsble Physiology; The Pacific Ocean; A Singular Meteor; An Enormous Ruby; The Planet Juhiter; The Smell of Onions, 51.

MECHANICAL PROGRESS.—Steam in its Fickle Moods; American Locomotives for Europe; Indelible Ink for Zinc Labels; Paper as a means of Defence; Another Monster Ship; Puddling hy Petroleum; Rsilwsy Progress, 51.

MINING SUMMARY from vsrious Counties in California, Arizona, Idaho, Montana, Lower California and Utah; Mining Shareholders' Directory; Stock Report, 52.

USEFUL INFORMATION.—Sharpening Edge Tools; Voracity of the Pickerel; The Development of the Lohster; The Time Planets Would Take to Fall into the Sun; Increase of Tea Drinking; Facts about Tacks; Improved Letter Envelope, 55.

GOOD HEALTH.—The Small-Pox Invasion; Tea Drunkards; Cod-Liver Oil Pills; Sleep and Dreams; Poisonous Mussels; Earth Poultices for Poisonous Bites; Spread and Extent of Intemperance; Sun-Stroke and Heat in New York; 55.

DOMESTIC ECONOMY.—A Chapter on Pickles; The Inside of Houses; Detection of Sulphuric Acid in Vinegar; To Test Green Paper for Arsenic; Protecting Furs from Moths; A Test for the Quality of Potatoes; Worms in Flower Pots; Practical Receipts, 59.

MISCELLANEOUS.—New Incorporations; Meetings and Elections, 57. Patents and Inventions: Official Notices about Patents; Regulations Under the New Mining Law, 60.

CALIFORNIA FISH AND BIRDS.—It would seem that the New Zealand people do not have a very lively appreciation of the fish and birds of California. The Auckland Acclimatization Society, who are in correspondence with the San Francisco Acclimatizatiou Society, resolved recently not to have anything to do with American birds. As to the fish, they came to the conclusion that the California salmon was a very inferior kind of fieh, of no use for sporting purposes, and would not jump at a fly. Some one stated that it very much resembled the hall trout of Scotland, from which we infer that the hall trout of Scotland do not amount to much. The Society acknowledged the letter of the Secretary of the San Francisco Acclimatization Society with thanks, and said that they would exchange any thing they had, hut that there were plenty of California quail in the Province at present, and they wonld wait for further instructions concerning the trout.

OUR STOCK TABLES.—We desire to call the attention of our readers to the improvements and extenaons whish we have made in the report of the stock sales and our "Mining Shareholders Directory." We intend paying particnlar attention to these departments hereafter, helieving that the increased interest in the mining share market which haa taken place in the last few months will materally aid in the development of mining propertiea in different parte of the interior, and our numerous readers in the mining districts are therefore much more interested in the matter then they have been heretofore.

Gold in Upper Burmah.

[Written for the PRESS by W. BREDEMYER, D. M. D. P.]

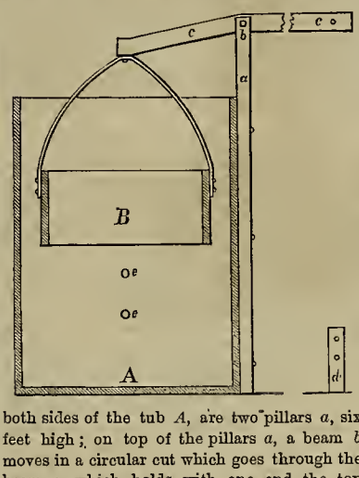
The first discoveries of gold in Upper Burmah were made centuries ago in the eand and mud of the Irrawaddy river, and its tributariee between the range of mountains belonging to the Himalaya and Ava, the old residence and capitol of the Bnrmah kings, and on the eidee of this river, but more particularly on its tributariee, thousands of men, women and children are working daily. Their usual appliancee for separating the gold from earthy material are the pan, and they gain with this from fifty ceuts to ten dollars a day. The pan is the same as in nse in all parts of Borneo, Australia and America.

This process being very elow, I introduced another mode of separating the gold in which I could work much larger quantities of dirt in less time, without any lose of gold whatever. This mode is very simple and nseful in places where there is

Little Water,

As I cau, after the earthy materials have settled, use the same water again.

It consists of a rectangular wooden tub, five feet long, three feet wide and four feet deep, with three feet of water inside. In this tub *A*, in the accompanying cut, ie hung another tub *B*, four feet, four inches long, two feet four inches wide, and one foot deep. The bottom of *B* ie sheet iron, thickly perforated with holes. On



both sides of the tub *A*, are two pillars *a*, six feet high; on top of the pillars *a*, a beam *b* moves in a circular cut which goes through the beam c, which holds with one end the top frame (which is iron) of tub *B*, and the other end is fastened at *d*.

When the tub *B* is half filled with dirt, one man gives to the tub *B* a springing motion by lifting the beam c gently, bnt quickly, up and down. The water, together with the motion, will force the gold, as the heavier substance, through the holee to the bottom, and the dirt and stones remain at the top, and the lighter earthy substances are washed away over the tub, *A*. After a while the motion ceases, the beam c is fastened again at *d*, the remaining earthy eubetance and stones in top of the tub *B* are taken gently off by an iron scraper; the tub *B* is filled again, and the same process ie repeated. The tub *A* should be cleaned every twenty-four hours by taking the tub *B* away, and letting the water off by e. The gold recovered in Burmah by this process of washing is perfectly free from all other substances.

Quartz Veins.

The mountain range in the gold district of Upper Burmah is principally silicious, micacious and argillaceous ehales, appearing together with granite at the surface in very many places. The elates appear in an angle of sixty and sixty-five degrees, and extend far over the country, from N. N. W. to S. S. E. These have been hroken by porphyry, basalt and eyenite. In the lower parts most all are slaty rocks, quartz and micaceous sandstone. The highest parts of the mountain contain sandstone, with numerous quartz veins, from one to fifteen feet in thickness. From time to time reappears the granite rock, forciug its way about every part of the area. It appears in large hanks and masses abruptly above the aurface. In other parts are dioritea, feldspar and porphyries, which alters the appearance. The quartz veins appear in the aame manner as all other mineral veins.

The greatest depth to which thesc veins are marked is abont two hundred feet, and they have yielded from six to eight ounces per ton at these depths, in some localities, and from fifteen to seventeen ounces a ton at other places in the country.

In former times the Burmese had not the slightest idea of mining. Their tools and methods were indeed very primitive; they worked about fifty or sixty feet deep, and when foul air and water stopped their proceedings, they etopped work aud commenced anew at other places.

I have opened during my etay in the couutry most of the old mines again, and maetered the water without engiues, labor being cheap, with chaiu pumps and water wheels. (I must mention here, that in the whole of Burmah on all the mines under my management, we had to do everything without engines). I always worked these gold mines on the same principal as any other mineral veins. By this means I advanced qnickly, being at much less expense and risk, never having trouble with water, fire or foul air, and have never yet experienced any accidents.

In former times the Burmese used for pulverizing the quartz an apparatus very much like a Mexican arastras. I introduced stamps, set in motiou through water wheels similar to that in use at the Commern Mechernicher lead and silver mine in Germany (Rhine Province).

I have no doubt but that Upper Burmah will turn out in time most certainly ae rich, if not much richer than California and Nevada. I am not permitted to give more information about Burmah than I have done already, as I had to swear before entering service ae Superintendent of mines by His Majesty, the King of Burmah, eecrecy concerning the customs and resources of the different parts of Burmah, Kakhyeeu and the Kahn States. I was at one time most horribly treated, crucified, by being tied to a tree, chains put on my hauds and feet in prison, and at last poiaoned on euspicione ouly, in July, 1869, which circumstancee were reported at the time in the Calcutta, aud some of the European journals.

COPPER.—James Lewis & Son's monthly report on oree and metal, dated Liverpool, July 1st, says that since the middle of June the market has been weak and inanimate and prices lower; sales amounted to 3,000 tous at from £107 to £102 per ton. On the 4th of July smelters advanced their quotations £5 per tou, £116 being the value of "tough cake," and £121 sheet copper. It ie thought that with cheap money and great scarcity of ore and regulus, prices will not recede much further at present; on the contrary, it is not unlikely there may be an advance if shippers are compelled to enter the market and take off a considerable quantity of bars. Early last month they purchaeed 1,000 tons, on private terms, but the price was understood to be about £106 per ton. Chili exports to June 2d amounted to 28,521 tons against 20,678 tons during the eame period laet year; 30,002 in 1870 and 34,888 in 1869. Stocks of West Coast prodnce are estimated at 14,914 tone, Fine, against 13,920 tons on the first of June. On the let of July last year there were 22,165 tons fine, when quotations were, bars, £68, ore 14s. Quotatione on July 1et, this year, were 20s 6d per unit for ore and regulue and £102 and £104 per ton for Chili bars, on spot, according to brand.

MINING EXPEDITION.—Two companies of men have been organized in Truckee connty to proepect for mines in the Apache country in Arizona, which means anywhere in Arizona. There are many rich minee all through the Territory, but prospectors had better wait a little while until General Crook gets through proepecting for Indians before they begin to prospect for gold or silver. They may "strike it" but etand a good chance of getting strnck themselves. The parties who intend going expect a peace treaty to be concluded before they get there, and will then depend on certain Apache chiefs to take them to a place exclusively held by these Indians where white men have never been allowed to euter and remain alive. The editor of the Truckee *Republican* very properly throws cold water on the euterprise, and says he would rather take his chances of life with Dr. Livingstone in the wilds of Central Africa, or among the Arctic icebergs, hunting np the North Pole, than to trust hie person to the magnanimity of the Apaches in the heart of Arizona.

A LOCAL RAILROAD.—The land-owners of Solano and Yolo counties have under consideration a proposition to build a narrow-guage railroad from Maine Prairie, in Solano connty, across the country to the mouth of and through Cache creek canon. The length of the projected road ia from 30 to 35 miles, but it would probably be extended into Lake county.

THE number of vessela now on the way to this port is greater than at any other time.

The Presidency of the California State University.

[From the Pacific Rural Press.]

At the meeting of the Regents on Tuesday last, it was expected that an election of President would be had. The meetinge of the Board are private, but the reports given out by the Secretary are to the effect, that the election was postponed one week, but no reasons are aesigned therefor.

We understand that Prof. Gillman, President of the Sheffield School of Science, of Yale College, has consented to accept the Presidency of the University if elected. Unknown to himself, he wae proposed and elected some two years since; but for certain and satisfactory reasone, he was not at the time able to accept the position. Prof. G. was then the choice of even the member of the Board whose name is now used (without denial) as a candidate against him.

Much regret was expressed at the time by the friends of the University, who knew Professor Gillman best, hie excellent fitness for the position and his sterling qualities; and now as then, we consider him in the highest degree acceptable. The election of a man to fill this position should be above any consideration of individnal favor rendered on the part of any man. Higher than mere personal friendship are the enduring interests of the institutions, and they should be guarded and fostered and be the pride of every iutelligent Californian.

No practical politician can hardly be found pure enongh to eerve in the capacity of President of the University without bringing dissentions. No mere headful of money-making brains can be popular enough to secnre the full unity and the beet efforts of all interested in the University. There are well informed men and business talent enough in the Board of Regents to carry on all the strategy necessary for the good of the concern or the interests of the people.

There are strong argumente in favor of securing the services of a man like Professor Gillman, who is in active training and spirit, and alive with the best experieuce of the day for such a position and we hope the Board will act with an eye single to the best and future interests of the Univereity, and not with reference to personal friendship or other individual relations or leseer considerations of any nature, nor let the opportunity be lost of making a grand, bold step toward securing the future onward progrese of the institution.

Moreover, we had enpposed that this high poeition was reserved to be occupied by one so entirely removed from all connection with previons efforts and movemente touching its creation, that not one objection could be raised on this or any other grounds.

No man can do too much gratuitously for the University to be fully rewarded by the eatisfaction of aiding the noblest work yet undertaken on this Coast. Its influence on future generatione is beyond human reckoning. What man shall say who has done most for the inetitution? Who has a right to eeek material reward?

Here is an institntion eminently the creation of the people of the State, and therefore in all its departmente ehould be made in the highest degree subservient to the public good, and we earnestly hope that throngh friendship and favoritism the Board will not do itself the injustice to elect one of its own wealthy and influential membere to the highest and largeet salaried office when the best, most practical and deeirable talent in the Union is offered—a person known and esteemed throughout the nation.

The people want the Presidential chair of the University, filled by a man of the highest literary attainment, coupled with that of a genial heart, that can go out in all its cosmopolitan fullness towards the people, and far above all snspicion of any exercise of personal favoritism.

Such a man we believe has been found in Professor Gillman, and we hope hie election will he by the nnanimous vote of the Board.

The magnitude of the interests involved in thia question have caused us somewhat reluctantly to indite this article, which, however, is rendered without persoual ill will; or a desire to detract from the just merits or praise of any one.

ART ASSOCIATION.—The exhibition of paintings under the auspices of the Art Association of this city waa opened on the evening of the 23d inst. to members. The exhibition, which posaesses much merit, is now available to the public.

NEW SILVER MINES.—A correspondent of the Helena *Herald*, (Montana) writes that very rich silver veins, in astonishing abundance, have been discovered on the ridge between Elk and Cherry Creeks, forming the divide of Madison and Gallatin counties. Considerable excitement now exists about this new mining locality. The ledges that have a westerly and easterly course, dip north; and those that have a northerly and southerly course slant east. The crevices vary from one to four and a half feet in thickness. Some of the main east and west running ledges are traced and located for about seven miles in a westerly direction to the Madison river, and easterly a mile or two; *across* these ledges four others have been found, showing large and solid crevices. It is stated that the quartz goes from $210 to $2,000 per ton in silver and gold.

Rich milling ores have been found in the new "Silver Zone" district, in the range 18 miles south of Toano, in inexhaustible quantities. These mines are in the same range as the Pioche deposits, and show good indications. The formation is granite and shale. The character of ore is excellent, and the district bids fair to become one of great importance.

According to telegrams one of the greatest bodies of mineral ever discovered has been located by two men from Illinois, named McHenry and Hughes, in Wasatch Range, 7 about seven miles south of Kimball's Hotel, Parleo's Park, and twenty-five miles from Echo, on the Central Pacific Railroad. The ledge crops out seventy feet, with an average width of thirty feet. Assays show a yield in silver of from $250 to $1,100 per ton, of free milling ore. The rock in sight is estimated to be over 20,000 tons, valued at over $5,000,000. Old mining experts and prospectors are said to be greatly excited.

CAVE IN THE CROWN POINT.—A cave occurred in the Crown Point mine on the morning of the 19th inst., between the 1,100 and the 1,200-foot levels. There were about 80 men in that part of the mine in which the cave occurred, but fortunately no one was injured. As they were just changing the shift they were not all at their stations, or there would undoubtedly have been loss of life. All the lights were blown out in the level, and also in the corresponding level in the Belcher. One peculiar circumstance connected with the cave as related by the Virginia *Enterprise* was the fact of all the rats leaving the chamber some time before it happened. They had probably felt the gradual closing up of their holes and hiding places previous to the cave, and left for other quarters. The damage was at first considered slight since only about 30 tons were said to have fallen. One of the men, however, says 3,000 tons is nearer the mark. The Superintendent wrote on the day it occurred, that it extended up from the track floor of the 1,200-foot level five sets, and four or five sets in length, closing the drift and leaving from 30 to 50 tons of loose ore in sight. A dispatch of the 23d inst., confirms the Superintendent's report, and says that everything is going along as usual.

IMPORTANT DITCH ENTERPRISE.—Messrs. J B. Wortser, Diggles, Smith and others have purchased the interest of all parties owning the old Knuff ditch, with the right to use the water in Kidder creek, and intend repairing and extending said ditch. The Yreka *Union* says that the present owners intend carrying the water across the divide near Muggansville in iron tubes laid on the surface, or below the surface, instead of a flume. The tubes will be fifteen inches in diameter in 12-foot sections. The iron, which has been purchased will be bent and punched in this city, and put together on the ground. The pipes are expected, under the pressure, to carry 800 inches of water. The company intend carrying the water both to Oro Fino and Muggansville. It will bring the water 200 feet higher than the present ditch at the former place, and will supply the means of working a large amount of hitherto unavailable ground. The ditch will be, when completed about fourteen miles long.

"DYNAMITE".—An evening cotemporary, which is usually very correct in its assertions, speaks of interesting experiments in Wales, with a new explosive called "Dynamite," the invention of a Mr. Nobel, of Hamburg. It is a compound of infusorial earth and nitro-glycerine. This Dynamite, or, more properly speaking Dynamit, is merely Giant Powder, with which we are all familiar on this Coast. When the company who manufacture it in this country, was formed, they thought it better to drop the Greek name and adopt an appropriate English one. Experiments similar to those referred to by our cotemporary, were tried here a few years since. It is not a new substance, though a very useful one.

The Eureka Pump.

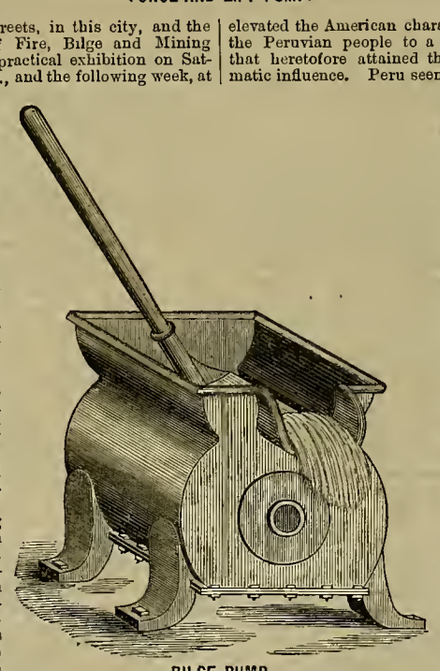
The accompanying cut represents two different forms of the Eureka pump, which is just being introduced on this Coast by Mr. J. M. Keeler. The construction of this pump is very simple, consisting of double valves. Its simplicity makes it difficult to set it out of working order, and easily rectifies, if it does. One of 1,000 gallons per minute capacity, can, it is claimed, be worked by one man easily, while other pumps of similar capacity require a force of many horse power. It can be used for extinguishing fires, and as a ship, house, farm and mining pump, or in any place where a pump is used. As a ship pump it is specially useful, since, it is said never to choke with chips, shavings, corn, wheat, or anything not too large to pass the valves.

FORCE AND LIFT PUMP.

Among the many testimonials to its efficiency is one from the Superintendent of a coal mine in Ohio, where it has been in use some time. After they were in 600 feet the water compelled their using a 15-horse power engine, with a pump of another pattern. Hearing of this one it was tried, and the mine relieved of water with one man's work as easily as the engine did it. The pump was afterwards run on half time, whereas the old one with engine was kept running all the time.

One of these pumps is now temporarily in use at the corner of Montgomery and Clay streets, in this city, and the different styles of Fire, Bilge and Mining Pumps will be on practical exhibition on Saturday the 27th inst., and the following week, at Brittain & Holbrook's on California street. The pump has been approved by the Board of Supervising Inspectors of Steam Vessels of the U. S., and by the Secretary of the Treasury, as appears by a circular issued from the Treasury Department, Feb. 21, 1872. It has received the approval of business and scientific men in the East, where it has been tried and worked successfully. If it does half that is claimed for it, the pump will be of special benefit on this Coast.

Parties desiring further information may apply to Capt. J. M. Keeler, Cosmopolitan Hotel, in this city. The Captain is an old Californian, and tells as that this pump is exactly suited to the wants of this Coast, for mining purposes particularly, while it can be used for irrigating, and in fact for any purpose to which a pump can be applied.



BILGE PUMP.

MINING ENGINEER.—Mr. W. Bredemeyer, the writer of the "sketch of the Geology of Upper Burmah" in our last week's issue and "Gold in Upper Burmah" in this week's issue, is now in this city and is desirous of making an engagement as mining engineer or superintendent. Mr. Bredemeyer is a graduate of the School of Mines in Dureu and Bonu, in Prussia, and has traveled for the past twelve years in the mining regions of India, Burmah and Japan. He comes to this Coast for the purpose above mentioned, and we would feel obliged to any of our friends in the mining districts who desire a gentleman of good mining education and extensive experience to be connected with their properties, if they would address a letter to that effect to Mr. Bredemeyer, in care of our office.

Peruvian Railroads.

A correspondent of the *Call*, who is evidently posted, writes that paper about the Lima and Oroya railroad in Peru. The distance is one hundred and twenty miles; highest altitude to be reached, 16,000 feet; gauge, four feet eight inches, and the grade very heavy. Trains were running at last accounts to Rio Seca, or sixty miles beyond Lima. The difficulties to be surmounted in building the road are said to be great. From Rio Seca back to Lima the trains are run without steam, the grades being uniformly down. Engineer's wages are said to be one hundred and fifty soles per month, a sole being ninety-six cents, American gold; first-class mechanics and blacksmiths get five soles a day; carpenters, three and a half to four and a half dollars. Good men in these departments are always in demand, the high price of living and unhealthy climate keeping men away from the country. Foreigners in Lima suffer more or less from bilious attacks, fever and ague, etc. Mr. Meiggs, whom all early Californians will remember, is successful over all competitors in getting contracts from the Peruvian Government for building railroads, which, the correspondent says, "in connection with his unostentatious generosity, and the liberal policy he has manifested towards all those in his employ, has elevated the American character in the eyes of the Peruvian people to a position far above that heretofore attained through any diplomatic influence. Peru seems to be considered a sort of modern Ophir, among many engineers and railroad employés, and frequent questions are asked by this class of people about the country, wages, etc. It would seem, from this correspondent's view of the matter, that the Government is an enterprising one in the matter of railroad building, but the climate is a severe one for strangers. He speaks of a kind of disease called the "Oroya fever," which prevails in the section in which this road is being built, and which at one time seemed likely, from its ravages, to prohibit its construction altogether. In the elevated regions around Arequipa, the terminus of the first railroad built in Peru by Harry Meiggs, these disorders are unknown. This letter gives us more practical information on the subject of this gigantic enterprise than any we have seen.

COAL IN ENGLAND.—Dispatches from London say that the price of coal is steadily advancing, and that the ocean steamers have raised their fares. Everything connected with the coal trade is higher. Importation from Belgium has commenced. This is a bad outlook for parties connected with the iron interest, since it will undoubtedly influence the already high price of iron. A scarcity of coal in England is something unusual, since its resources in that respect are proverbial. The production of pig iron in Great Britain, has steadily increased since 1864 in the ratio of 47 to 65, and the demand for coal has proportionately increased, which is one important reason for this rise in price.

New Incorporations.

MENDHA S. M. Co.—July 19. Location: Highland District, Lincoln county, Nevada. Capital $5,000,000, in 50,000 shares. Trustees—Thomas Bell, C. J. Brenham, O. F. Giffin, James Fiudla and Henry Raymond.

AMADON TUNNEL M. Co.—July 19. Location: Ely District. Capital stock, $2,000,000, in 20,000 shares. Trustees—S. Steinhart, H. Mayers and N. C. Fassett.

JOHNSON G. AND S. M. Co.—July 19. Location: Sierra County, Cal. Capital stock $1,600,000, in 16,000 shares. Trustees—Peter Johnson, Peter N. Ryan, Charles O'Donnell, W. T. Bradberry and Nicholas Steiner.

HOME G. M. Co.—July 22. Object: Mining and the buying and selling of mines. Capital $1,000,000, in 10,000 shares. Trustees—F. H. Waterman, John Bell, Charles Hosmer, Thomas Findley and Charles Webb Howard.

THE PRINCE REGENT CON. S. M. Co.—July 20. Location: Nevada. Capital stock $3,000,000. Trustees—P. J. White, J. M. Allen, W. J. Jones, Henry Baker and M. B. Terwilliger.

SILVER LICK CONSOLIDATED M. Co.—July 24. Location: Eureka District, Lander county, Nevada. Capital stock, $5,000,000, in 50,000 shares. Trustees—Alpheus Bull, John O. Earl, David B. Blair, George W. Clark and L. A. Booth.

PIOCHE CHAMPION Co.—Location: Ely District, Lincoln county Nevada. Capital stock, $3,600,000, in 36,000 shares. Trustees—Emile Hestres,, George Reiter, Alexander E. Sahatie, Albert Scharowski and Theodore La Roy.

THE certificate of the increase of capital stock of the Hardy Coal Mining Co., from $200,000 to $500,000, divided into 5,000 shares at $100 each, was filed on the 22d inst.

Meetings and Elections.

Trustees for the Tecumseh Mining Company were elected on the 18th inst. as follows: J. F. G. Eggers, John Greif, Joseph Gatz, P. J. Herrmann and George Eggers.

The Pauper Mining Company have elected the following Trustees: D. Fay, John Fay, John W. Coleman, A. H. Lissak and G. W. Beaver. The Board was organized by the election of D. Fay as President and Joseph L. King as Secretary.

The annual meeting of the Union Consolidated Silver Mining Company was held July 20th. J. J. Hucks, Geo. D. Roberts, M. J. McDonald, F. M. Freund, and S. W. Lee, were elected Trustees. At a subsequent meeting of the Trustees J. J. Hucks was elected President: J. M. Buffington, Secretary, and Jas. R. Lee, Superintendent.

The Pioche Champion M. Co. elected the following Trustees on the 20th inst.: A. E. Sahatie, George Reiter, P. Hestres, T. LeRoy, and A. Sherowski. D. Watteler was chosen Superintendent, and A. Noel Secretary.

Trustees for the Dardanelles Mining Company were elected as follows on the 20th inst.: Jas. A. Pritchard (President), O. C. McCracken and J. J. Robbins. Jos. L. King was retained as Secretary, and J. P. Jones as Superintendent.

At the annual meeting of the El Dorado South Consolidated Mining Company, held on the 18th inst. the following gentlemen were elected Trustees: A. Hayward, J. S. Slauson, W. S. McCormick, H. Epstein, H. Mayers, W. F. Leon and J. Steinhart. At a subsequent meeting of the Trustees J. S. Slauson was elected President; H. Epstein, Vice-President; and J. W. Cask, Secretary.

At a meeting of the Pallis Mining Company, Ely District, Nevada, the following Trustees were elected: George A. Treadwell, President; Charles F. Hamilton, Joseph Bremer, General P. E. Connor and Charles J. Deering. A. Treadwell was appointed Secretary, and John B. Martin, Superintendent.

At the annual meeting of the Yellow Jacket Mining Co., held at Gold Hill, Nevada, the following Trustees were elected: Thomas G. Taylor, William Sharon, D. L. Bliss, T. B. Stover and G. W. Hazelton. At a subsequent meeting of the Trustees, the following officers were elected: Thos. G. Taylor, President; G. W. Hazleton, Vice President; Wm. Sharon, Treasurer; Thomas G. Taylor, Superintendent; G. W. Hopkins, Secretary.

The first annual meeting of the Arkansas Mining Company was held on the 22d inst., and L. L. Robinson, R. Bayerque, J. M. Byrne, J. J. Valentine and J. Menu was elected Trustees. At a subsequent meeting of the Trustees, L. L. Robinson was elected President; R. Baycrque, Vice President and Treasurer; George Davidson was appointed Secretary *pro tem.*, and H. Phillips, Superintendent.

MINING SALES.—The San Andreas *Citizen* says that one-third interest in the Zacatera mine, near West Point has been sold by J. Lefoy for $8,000.

The Deer Lodge *Independent* informs us that R. S. Kelley of that place, has purchased five twenty-fourths in the Rock Creek Ditch for $12,000.

The Chloride mine in Humboldt county has changed hands. No figures given.

A conditional sale of three-fourths interest in the Good Will placer mine, on the San Gabriel, in Los Angeles county, has been made for $10,000, that amount to be used in developing the mine by hydraulic process.

A FINE bed of iron ore has been discovered near Oswego, Oregon.

Domestic Economy.

A Chapter on Pickles.

Pickles, a "Terrible Temptation"—A "Device of the Enemy."

We know of no more convincing proof of the total depravity in our natures, than the profound desire for pickles, at just the time and moment when we ought not, above all things, to eat of them. The word pickle, in itself, has a dark end evil sound. It is a synonym of unwholesomeness, and undoubtedly had its origin in the period of "The fall," which must have been of considereble duration to comprehend all the evils ascribed to it. But until the world is vastly wiser and better, will pickles go out into utter darkness, and be known no more. There never was such a thing as a wholesome pickle known; but as Sin has a ministry as well as Good, we purpose to lend a helping hand to Evil in giving a chapter on pickling, and afterward, like Pontius Pilate, wash our hands of the whole matter.

General Rules.—For heating vinegar, use a porcelain lined vessel. Brass, copper or tin should not be used; but if used the greatest care should be observed, both in their cleanliness and in pouring the vinegar out as soon as cooked. Otherwise, serious results may supervene. Use *wooden* knives, forks and spoons, if such implements are needed in the pickling operations.

Vessels for Pickles.—Large mouthed, glass bottles for small quantities; wooden vessels for large quantities may be used, but glazed jars must NEVER be used, as the vinegar acting upon the glazing; produces a strong POISON.

Vinegar.—The best is wine vinegar, but it is expensive. The next is cider vinegar. Beer vinegar comes next. Pryolignic vinegar is exceedingly unwholesome. By the term pyrolignic, we mean that manufactured from an acid distilled from wood. If pickles present an eaten appearance, it signifies that the vineger is too sharp. The addition of alum hardens the pickles, and renders them still more "villainous." Salt affects the life of the vinegar, and its use should be avoided as much as possible. Much boiling also injures the vinegar.

Peaches.—Select the fruit fully grown, but not fully ripened. Wipe off the down thoroughly, using either a wet cloth or by pouring hot water over the peaches and then wiping them dry. To a peck of fruit allow a gallon, or thereabout, of moderately weak vinegar, three pounds of sugar, an ounce of cinnamon, and four or five cloves to each peech. The cloves may be stuck into the fruit, or the spices boiled in a bag with the sugar and vinegar. Put the fruit in the vessels to hold it, and pour the ingredients over it, boiling hot. Be careful end skim the vinegar well as it boils; cover well and set in a cold place for a few days, when drain off the vinegar, heat it hot, and pour on; when cold, the fruit and pickle may be put in glass jars and secured like preserves. Some picklers add the well-beaten whites of three eggs to the above quantity of vinegar, scalding and skimming until clear.

Pears are pickled after the same manner; small pears of uniform size are preferable.

Plums.—To six pounds of plums, three pounds of sugar, one quart of vinegar, and one ounce each of cinnamon and cloves. Arrange the fruit, sugar and spicee in layers. Scald the vineger and pour it over the fruit. Repeat the scalding for three or four days in succession.

Sweet Apples.—To half a peck of apples, make a syrup of two pounds of sugar, and one pint of vinegar. Boil the apples in this syrup until tender; then remove them and make a new syrup of two pounds of suger, and one pint viuegar. Add one teaspoonful of cloves, and the same of cinnamon tied in a bag. The first syrup may be used for sauces.

Nasturtiums.—Gatbor the seeds beforo entirely grown, and drop them into cool vinegar; when a sufficient quentity has been gathered, scald them in the vinegar, and bottle.

Green Beans.—Boil the beens in a little salt and water until tender; drain them and put them in cold vinegar into which spices scalded in a littlo viuegar have been thrown.

Onions.—Remove the outer skin of small onions; boil them until helf done in salted water; while hot, drop them into a jar of pepper-spiced vineger. Another way; soak them for three days in hrine; then sceld them in milk and water; drain, lay them in a jar and pour over cold vinegar, scalded spices and a little alum; cover closely.

Radish Pons.—Put them in a brine for three days; drain and pour over them a pickle of vinegar, cloves, cinnamon and pepper scelded together.

Beets.—Boil until tender, and drop while hot into spiced vinegar. If the beets are large, slice them. Spiced vinegar in which peaches have been pickled is good for beets.—*Rural New Yorker.*

Linseed Oil Varnish.—Take eight pounds of linseed oil, and boil for one hour; then add one pound of the best rosin, (powdered,) and stir the mixture until the rosin is dissolved; now add half a pound of turpeutine, let it cool, and it is ready for use.

The Inside of Houses.

The Sitting-Room.—The sitting, or living-room, should be the lergest end pleasantest room in the house. It should always be located at the front, and on the side where the sun will enter the windows. All means should be employed to render it attractive, comfortable, and convenient, for it is generally used for the dining, as well as the sitting-room, and is occupied for more hours in the day than any other apartment. That indispensible nuisance, the parlor, may be a secondary consideretion; it has an air of frigid propriety and disuse, and the north side of the house is good enough for it. The kitchen should be spacious, and the pantry and wesh-room heudy. There can hardly be too many closets. Every house where civilized beings live, ought to be from nine to twelve feet between joists.

The Library.—Every house whose occupants pretend to any degree of refinement, ought to have a room known as the library or study. Especially should every farm-house be so provided. This room is quite as important as the parlor. Almost anything else should be sacrificed to it. It need not be large, but it must be comfortable, and somewhat secluded, and it should be conveniently furnished. Here there should be maps, shelves for the hooks, hoxes or files for the egricultural papers, and a good desk, with apartments for letters, memorandum book wherein to record farm experiments, and a blotter and ledger, wherein to keep the farm accounts with animals, fields, and crops. Farmers ought to read more, write more, and think more, they have no husiness to be clods or boors. With such a room as this, made attractive, farmer's boys will be less disposed to stroll about during the long winter evenings, or spend their time in idle talk, or in har-rooms, stores, and other places, where the idle and uncultivated assemble, end where they often acquire the first lessons in smoking, drinking, and gaming, and they are far more likely to spend their lives on the old homestead, too. Rooms ought to be of a size to fit carpeting, which is 24 or 36 inches wide.

Light.—Do not arrange your house so as to violete God's first command. Give it many windows, and then, oh housewife, keep your blinds open during the day, and your curtains drawn aside. If you let in the sun freely it may "fade your carpets," but if you do not it will be sure to the mothers and children. The sun is a good physician; he has never had due credit for his curetive qualities—for the bright eyes and rosy cheeks that come from his healing baths. Do you know how puny is the growth of a potato vine along the derkened cellar wall? Such is the health of human beings living where the sunshine is intercepted by the window's drapery. So dark wall paper is not only gloomy, but it physically unwholesome. Let in the sun—for with it come cheerfulness and strength! A dark room is an enemy of good health, good temper, and good morals.—*American Builder.*

Detection of Sulphuric Acid in Vinegar.—One of the most common and deleterious adulterations is sulphuric acid in vineger; hence any ready means of detecting such adulteration would be of great convenience to every housewife. The *Journal of Pharmacy* says that the following procese will detect the 500th part of free sulphuric acid, and is accurate for all practical purposes. An ounce of the vinegar to be examined is reduced by evaporation on a water bath to about half a drachm, or the consistency of a thin extract; when quite cold, half a fluid ounce of strong alcohol is added, and thoroughly incorporated; the free sulphuric acid will be taken up by the alcohol, to the exclusion of any sulphates; the alcoholic solution should stand for several hours, and then he filtered: add to the filtrate one fluid ounce of pure distilled water, and evaporate the alcohol off by the application of a gentle heat; the remaining liquid is then left for several hours, and again filtered; to the filtrate, previously ecidulated with a few drops of pure hydrochloric acid, a solution of chloride of berium is added, which, if sulphuric acid be present, will yield a white precipitate.

A weter heth may be readily extemporised in any kitchen by putting some sand on top of the stove and thereupon putting a teacup in the absence of a regular evaporating dish, in which the vinegar to he tested should be placed for slow evaporation.

To Test Green Paper for Arsenic.—The tests for arsenic, strictly so called, are suited only the loboratory use, but since it is the arsenite of copper that is employed for the poisonous green colors, a test for *copper* is sufficient for ordinary purposes. Put a drop of liquid ammonie on the suspected paper, and if it chenge the color to hlue, you may be sure thet copper is there, and almost ae sure that arsenic is present also. There is not one chance in a hundred that a more critical examination would lead to a different conclusion. At eny rate, we advise our readers not to use any paper on the walls of their houses, or for any other purpose, if thie simple test makes its character suspicious.

To Remove Stain from Mahogany.—Stains may be taken out of mahogany by spirits of salt, (muriatic acid.)

Protecting Furs from Moths.—The secret of the preservation of furs from motbs lies in two facts. First, thet they are put awey in season; that is, before the moth-mother mekes her appearance, which she does quite early in the spring, though this year, if she does not desire to get her tender little wings nipped, she will be later than usual. And second, thet they are so securely protected thet it is impossible for Mrs. Motb, having once been shut out, to coax, bribe, or force be way through the barrier. The conclusion, justified by the experience of several years, is, that the best, the only certain means of preservation, is to put away our furs early in the season, either in perfectly sealed paper bags, inclosed in tin cases, or in paper-boxes, with peper pasted closely over the edges of the cover, or any other opening by which a moth could creep in. Of course peste will be unreliable in any place where mice can obtain access.

A Test for the Quality of Potatoes.—It is generally understood that the value of potatoes depends upon their specific gravity, and that the heavier the potato the greater the amount of nitrogenous matter it conteins. This has suggested the idea of a convenient test by which the excellence of different varities can be readily determined, and which consists in the use of saline solutions of different degrees of strength. If, assuming one variety as a standard, we make a solution of such strength that the potato will float at about the middle of the mass, neither falling to the bottom nor rising to the surface, and apply the same test to the other potatoes, we may conclude that if one fall to the bottom it is better, or if it rise to the top it is poorer, than the standard.

Worms in Flower Pots.—Many ladies are puzzled how to get rid of the detestable worms that will infest the earth in their flower-pots. The following recipe which we find in an exchange is recommended to destroy the pests:—"Put one ounce of ammouia into one gallon of warm water, and water the plants with it once a week; they will be free from these worms, and be beautiful and green. To kill the little bugs that get on the oleender, take a piece of lime the size of a hen's egg, and dissolve it in about two quarts of water, and wash the stock and branches of the tree; they will disappear."

Practical Receipts.

Potato Puff.—Take cold roast meat—beef or mutton, or veal and ham together—clear from gristle, cut small, and season with pepper and salt, and cut pickles, if liked; boil and mash some potatoes, and make them into a paste with an egg, and roll out, dredging with flour. Cut round with a saucer, put some of the seasoned meet with one-half, and fold it over like a puff; pinch or nick it neetly round, and fry it a light brown. This is a good method of cooking meet which has been cooked before.—*Denver Tribune.*

Stewen Figs.—Put into a stew-pen four ounces of sugar, the thin rind of a large lemon, and one piut of cold water. When the sugar is dissolved add one pound of hest figs, and place the pan on a stove so that the fruit may swell gently and stew very slowly. When quite tender, add the strained juice of two lemons. Arrenge in a gless dish and serve cold.

Corn Bread.—Take four cupe of sour milk, one of these partly filled with cream; one egg, a little selt, two even teespoonfuls pulverized soda; mix the soda with a little corn meel, and stir alltogether, till it foems; then add cornmeal till a thin batter ie ohtained, and pour into hot tine, oiled, an inch deep, and bake in a quick oven.

Peaches and Cream.—Peel soft juicy peaches, quarter them, put a layer of peeches, one of sugar, sprinkling on very thick until the desired quantity is prepared. Spread thickly over the last leyer of peaches powdered loaf sugar. Set the dish upon ice or in a very cool place an hour before using; do not bruise them. Some persone like them best meshed fine, sweetened, and a little grated nutmeg added; in either way serve in small deep plates; eat with rich cream.

Baked Pudding.—The following is said to be one of the best puddings ever used in the Metropolitan Hotel of New York: Five tablespoons of corn starch to one quart of milk; dissolve the starch in a part of the milk, and heat the remainder of the milk to nearly boiling; heving salted it a little, then add the dissolved starch to the milk; hoil three minutes, stirring it briskly; ellow it to cool, and then thoroughly mix it with three eggs well beaten with teblespoons of sugar, flavor to your taste and bake for half an hour.

To Polish Furniture.—Melt together in a small vessel, ½ apound of beeswax, and ¼ of an ounce of alkenet root, until the former is well colored; then add linseed oil, and spirits of turpentine, of each ½ a gill; strain through a piece of coarse muslin.

Ham Toast.—Chop some lean ham, put in a pan with a little pepper, a lump of butter and two eggs, beeten; when beaten thoroughly spread it on buttered tost, and serve hot.

"Every Day" Pudding.—Helf a loaf of stale bread soaked in a quart of milk, four eggs, four tehlespoonfuls of flour; a little fruit, dried or fresh, is a great addition. Steam or hoil three-fourths of an hour.

To Brighten Colors.—Soda in the rinsing water will clear up and intensify almost any blue and purple. Vinegar will do the same for pink or green calicoes. It is said that a strong decoction of common hay will preserve the color of French linens and lawns.

Our Neighbor Idaho.

Agriculture in Idaho has but few prominent features of independence; her fertile valleys are limited in number as well as size. Grand Ronde, Boise and some of the southern valleye comprise the greater portion of the fertile lands of Idaho. Boise and Grand Ronde have for some years produced vegetables sufficient for home consumption. Ronde Valley is capable of producing excellent wheat, barley oats and corn; early as 1869 over 1,000,000 bushels of wheat and oats were raised in this valley, and the total quantity of flour that year amounted to 100,000 barrels—the flour from the Grand Ronde is of a very superior quality. There are four mills in the valley, one alone turned out 12,000 barrels in 1869 from that seasons' wheat.

Boise City, and all northern Idaho receive the majority of their supplies, or at least until within a year, via Columbia river and Umatilla. And for sometime until the Humholdt route was opened Owyhee merchants were obliged to freight from the Columhia, over a route, that required sixty days' travel, and sixteen cents per pound freight charges.

Humboldt Route.

As soon as it was found practically cheaper to open the Humholdt Route, Sacramento merchants were not slow in placing their heavy teams on the road. The total number of teams that carried freight into Owyhee the first season after the opening of this road was 45, and the amount of freight was over 250 tons. These figures increased every year and freight came in faster and cheaper, as the road was shortened hy the advance of the Central Railroad.

Kelton

Is now the shipping point for Boise City and northern towns. The distance from Kelton to Boise City is 246 milee; much of the freight is still sent by way of the Columbia, for the reason that Oregon still controls the northern Idaho trade.

The territory must always he supplied with certain specialties that she cannot supply from her own resources—fruit in particular. Meats and dairy produce she can help herself to a considerable amount. So far very few have undertaken the manufacturing of hutter and cheese. There is an abundance of summer feed for cattle, but the winters are too long and severe; hay is ecarce, and the streams are not large enough to irrigate meadow and pasture lands. So, to a great extent, Idaho must yet depend upon her neighbors. Oregonians have very naturally controlled this trade which is large and remunerative.

Silver City

Is nearer to the great artery of the coast, the Pacific Railroad; the county seat of Owyhee county, 210 miles from Winnemucca. Small fertile valleys occur numerously among the rugged surroundings of Silver City. Milk ranches and small gardens supply the general demand of the town. Cattle thrive well in the southern portion of Idaho on hunch grass—but the great mass of supply must he furnished from Nevada and California. Uniontown and Oreana in the Humboldt districts must also depend upon our markets. Virginia City merchants have had their ehare of this trade.

Manufacturing Goods

Must he supplied for some time, and some things must always be made ont of the Territory; here is a point worthy the attention of California manufactnring firms. Oregon is rapidly moving forward in her manufacturing interests and enterprises. In machinery she will ere long compete with our firms, for the great trade of the Territory north of us. To Idaho, in this respect, she has always sustained prominent favor. The Willamette Iron Works at Portland, turns out a class of work that finds market and favor at once. Contracts are made there at San Francisco prices without incumbrance of delay and freight charges hy sea. Oregon is doing a heavy exporting business with her neighhors, and the completion of the Central road does not tend to attract much of that business to California.

Idaho is rapidly increasing her trade, and Utah has already figured how she can command the eastern portion of it, in the event of the new discoveries in that portion of the territory proving lucrative; in way of frnits and light supplies California has had the exclusive trade, but general supplies, have been purchased in Oregon, Nevada and California, and increased trade should he established hetween our merchants and Idaho, machinery, dry goods, drugs, wares of all kinds particularly.

BURLEIGH
ROCK DRILLS
AND
AIR COMPRESSORS.

The Burleigh Rock Drills, which have stood the test of five years constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequalled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunnelling, Sinking, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground, or compressed air when under ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being applied.
Send for illustrated pamphlet to

NELSON & DOBLE,
AGENTS FOR
Thomas Firth & Sons' Cast Steel.
MANUFACTURERS OF
Sledges, Hammers, Stone Cutters', Blacksmiths' and Horse-Shoers' Tools.
13 and 15 Fremont street, near Market, San Francisco.
10v14qr

STEPHENS & CO.,
MANUFACTURERS OF
U. S. STANDARD BOXWOOD AND IVORY RULES.

ALSO EXCLUSIVE MANUFACTURERS OF
L. C. Stephens' Patent Combination Rule.
This cut represents the COMBINATION RULE, which comprises a Foot Rule, Spirit Level, Try Square, Bevel, Plumb, Slope Level, Etc.
It is made of the very best quality of Turkey Boxwood, heavily bound with brass, and is graduated with mathematical accuracy.
The Square is adjustable, and can be tested and made perfectly true by the aid of a small screw-driver, but this is seldom required.
In its application as a Slope Level it is especially adapted for Miners' use, as it shows the PITCH TO THE FOOT, and DEGREE OF INCLINATION at once. It is six inches long when folded, by one and three-eighths wide, and three-eighths inches thick, the cut being just one-fourth size.
"By the use of one of these, a builder, mason, carpenter, or other workmen, can always have in his pocket the most valuable of his apparatus used in construction, combined in a portable, useful and cheap form."—*Scientific American.*
Price by mail, prepaid, $4. For agents' terms, address
STEPHENS & CO.,
18v24-3m Riverton, Conn.

REMINGTON'S
BREECH-LOADING
Sporting, Hunting, and Target Rifles.
Same system as the "Remington" Celebrated Military Rifle, of which over half a million have been sold. Its simplicity unsurpassed. For strength and durability unequalled. In accuracy unrivalled. In range, penetration, and ease of manipulation, without comparison.
The "Sportsman's" Delight, the "Hunter's" Favorite, the "Target-Shoots 's" Pride. Also
REVOLVERS FOR HOUSE USE.
In these days of thieves and Burglaries, every householder should have a revolver for home protection.
REMINGTON'S RIFLE CANE.
Every gentleman should have one for protection against dogs and rowdies, and for field use.
E. REMINGTON & SONS,
19v24-6m 193 Broadway, N. Y.

SHEET IRON PIPE.
THE
Risdon Iron and Locomotive Works
Corner Howard and Beale Streets,
Are prepared to make SHEET IRON AND ASPHALTUM PIPE, of any size and for any pressure, and contract to lay the same where wanted, guaranteeing a perfect working pipe with the least amount of material.
Standard sizes of railroad Car Wheels, with special patterns for Mining Cars. These small wheels are made of the best Car Wheel Iron, properly chilled, and can be fitted up with the improved axle and box—introduced by this company, and guaranteed to outlast any other wheels made in this State.
☞ All kinds of Machinery made and repaired.

JOHN TAYLOR & CO.,
IMPORTERS OF AND DEALERS IN
ASSAYERS' MATERIALS,
Chemical Apparatus and Chemicals,
Druggists' Glassware and Sundries,
PHOTOGRAPHIC GOODS, ETC.,
512 and 514 Washington street, SAN FRANCISCO.
We would call the special attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our large and well adapted stock of
ASSAYERS' MATERIALS
—AND—
Chemical Apparatus,
Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast.
WE ENUMERATE IN PART:
Assay Balances—L. Oertlings, Loudon.
Assay Balances—Becker & Sons, Antwerp.
Chemical Balances—Becker & Sons, Antwerp.
Ore or Pulp Balances—Becker & Sons, Antwerp.
Assay Weights—Grains and Grammes.
Bullion Balances and Weights.
Humid Assay Apparatus.
Iron Furnaces—Improved, Lined with Fire Brick for Cupelling and Melting.
Tongs, Muffles, Cupel Moulds, Assay Moulds, Scorifiers, Roasting Dishes, Annealing Cups, French Clay, Assay Crucibles, Hessian (or Sand) Crucibles.
Dixon's Celebrated Black Lead Crucibles and Covers—all sizes.
Assayers' and Chemical Glassware and Assayers' Hardware—a full assortment.
Steel Stamps for hair cut to order.
ACIDS AND CHEMICALS.
Acid in carboys and bottles, commercially and chemically pure.
Bi Carb. Soda, Borax, Bone Ashes, Litharge.
Assay Lead in bars, rolled and granulated.
Black Oxide Manganese, Sodium and Sodium Amalgam, Sulphate of Copper, Quicksilver, and all Chemicals and Reagents required by Assayers and Milling Co.'s.
☞ Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in Grains and Grammes, will be sent upon application.

[Continued from page 52.]

CLARA ANN AND LOMBARD.—These mines are on the western slope of Treesure Hill. A shaft is down 110 ft. on the Clara Ann. The ledge was cut at a depth of 70 ft., and for a depth of 40 ft. it widened ont to a width of 20 ft. The richest of the ore in the ledge matter ie in a streak from 3 to 4 ft. wide.

SILVER WAVE.—Breesting out in Boswell chamber. Will commence crushing ore at Swansea mill the beginning of next week. The ore in No. 4 chember continues to hold out of the usual grade. Perkine sbaft down 170 ft., in limestone and spar.

SPRUCEMONT.—Elko *Independent*, July 13th: The Ingot Co. is pnshing ehead fest. They have severel thousand tons of ore ready to smelt as soon ae their furnace is completed, which is being constructed repidly. Laborers are in demand and wages are good.

Arizona.

WALLAPAI.—Prescott *Miner*, July 6th: The furnaces—one at Cerbat and the other at Cbloride—are in operation. Several mines in the Dist. are yielding plenty of rich ore. Mr. Hardy's little mill, at Mineral Park, is crushing ore and making it pay well.

The Dist. has been visited hy a very heavy fall of rain, and $12,000 worth of tailings have been washed off from Mr. Hard's mill.

Idaho.

LOCAL RECORN.—Owybee *Avalanche*, July 13: At the Minnesota they seem to be senguine of getting a fine body of ore in the 2d level drift south.

The Elmore shaft is down 90 odd ft. for tbe 8th level, and tbe south drift ie in about the same distance from the winze, 134 ft. north of the shaft. The north drift is in over 60 ft. from tbe winze. The foreman expects to connect the sheft and the winze August 1st.

The mahogany is doing well. Elmore mill is crushing 25 to 30 tons of tbeir ore per day. They have a fine vein of ore in tbe winze below tbe 5th level, which is down 70 ft.; shaft is down 35 ft. for this level.

Tbe Empire hoisting works are not all here yet, but they have commenced drifting from the bottom of the shaft, hoisting with windlass power; not very hard running. Ledge fully 2 ft. wide.

The South Chariot is down 80 ft. below 4th level.

The Red Jacket is looking exceedingly well. Rich ore is being raised from both north and south shafts. Tbe north shaft is down 32 ft. and is ehowing a veiu of not less than 18 inches in width, and ore with plenty of free gold. The soutb shaft is down 7 ft. below the adit level, or say about 60 ft. from the surfece.

The Durango, a short distance west of the Empire has a sheft of 40 ft. in depth, at the bottom of which the ledge is ahont a foot wide, showing free gold in abundance. The last crushing some 6 yeers ago, yielded $11 per ton.

Lower California.

SAN RAFAEL.—Sen Diego *Union*, July 11: The mines of Sen Rafael and vicinity are looking well, and there are good prospects ahead. Six quartz mines are being worked, the ore being crushed by the arastra process.

Some exceedingly rich discoveries have recently been made, one of the best of tbem heing that of a very fine gold quartz lode by Mr. Misonne.

Little is being done in the way of placer mining ou account of the ecarcity of water. Some rich placers are being worked by the dry washing process.

At San Antonio, about 30 miles from San Rafael, a party of Frenchmen have recently discovered a very rich silver and copper mine.

Montana.

UNCLE BEN'S GULCH.—Deer Lodge *Independent*, July 13: Twenty men are at work in that gulch. Three hydraulics are running. The mines average from $10 to $30 per day to the hand.

HENDERSON GULCH.—Ferguson & Co. cleened up on Monday last $2,000 from 2 weeks' run. The claims averages from $15 to $20 per ton to the hand. Chas. Carlton, Jas. Burns & Co., next below, are making from $15 to $20 per day to the man. Cartwright, O'Connor & Co. are making from $30 to $50 per day to tbe hand. McDermott, Hennessy & McAndrews are meking from $20 to $40 per day to the man. The next Co. helow are puttiug down their flume, intending to work a back channel on the har. Walwork, Terrill & Davis are running two hydraulics and are making money.

Utah.

CAMP FLOYD.—Cor. S. L. *Tribune*, July 16: The minee are all makiug a very good showing. More strikes are daily reported.

STAR. Cor. same: It is reported that a 20-stamp mill has been shipped from S. F. for tbe South Camp.

A 10-stamp mill is also shortly to be erected by the "Shenandoah" and "Midas" Cos.

Work is being prosecuted on most of the promiuent ledges in camp. On the Last Cbance, the Supt. is driving a tunuel, and sinking a shaft. The formation is quartzite upon one side and lime upon the other. The ledge has every appearance of being a true fissure vein. The Hidden Treasure is looking finely. Shaft 40 ft. deep in a ledge of solid material, from 3 to 7 ft. wide, assaying from 30 to 80 per cent. lead, and from $50 to $100 silver per ton. The Osceola shows a fine body of A No. 1 ore. Operations upon the Temperance, and several other mines, have beeu suspended, temporarily, to give the men an opportunity of celebrating in proper style.

PATENTS & INVENTIONS.

Official Notices About Patents.

U. S. PATENT OFFICE, June 28, 1872.

There are but few things that occesion more trouble to the Office, or more annoyance to applicants for petents, then the practice of intercepting ceses for various causes after they have been passed for issue aud the final fees peid. Tbe trouble to the Office, resulting from tbese stoppages, has been greatly increased hy thc puhlication of the volumes provided for by the joint resolution of Cougress, approved Jannary 11, 1872; and now that Congress has anthorized the publication of the *Illustrated Official Gazette*, it has become absolutely necessary to obviete the difficulties referred to.

It is therefore ordered, that—

Patents will hereafter *bear date and issue* on the Tuesday next succeeding the payment of the final Governmeut fees, though they will not be *delivered* until two weeks after the seid date. The two weeks' delay, it may be stated for the benefit of those not so familiar with the course of official business, will be occupied by the necessery priuting, photolithographing, etc.

Reissnes, designs and trade-marks mede up es a part of the seid issue will bear even date with the said patents of inveution, and are deliverable after the same interval, occupied hy tbe artistic end mechanical execution of the document, the necessary recording, etc.

After 12 M. of the date of iseue the delivery of no patent will be arrested for any cause whatever.

The issue closee at 2:30 P. M. of Monday preceding the date of the petent, end no final governmeut fees are receivable after thet time.

When patents are to issue to assignees, the aseignments must be on record hy Mondey 3 P. M. previous to the dete of said patents.

Tbie order will take effect on and after tbe 16th of July, the iesue of which date will proceed as nsual, being *dated, issued* and *deliverable* on that day.

The effect of this order will be to cause the two issnes next succeeding tbe 16th of July to bear the same date therewith, tbough the patents will be deliverahle on the 23d and 30th days, respectively, of that month.

Tbe patents which will bear date the 23d of July will be deliverable on the 6th of Angust, and on tbat day and thereafter matters will have assumed their new shape.

It will be observed that this change will work no delay whatever in respect of the delivery of any patent, hut it will amount, as compared with the present system, to a two weeks' antedating; it will remove oue cause of possible disappointment to the inventor; it will enable tbe office to keep its records unmntilated by obviating the occasional necessity for suspendiug and canceling after nnmbering, printing and paging.

M. D. LEGGETT,
Commissioner.

Regulations Under the United States Mining Laws.

MINERAL LANDS OPEN TO EXPLORATION, OCCUPATION AND PURCHASE.

1. It will be perceived that the first section of said act leaves the mineral lands in the public domain, surveyed or nnsurveyed, open to exploration, occupation and purcbase by all citizens of the United States and all those who have declared their intention to become such.

STATUS OF LONE CLAIMS PREVIOUSLY LOCATED.

2. By an examination of the several sections of the foregoing act it will be seen that the *status* of lode claims located *previous* to the date thereof is not changed with regard to their *extent along the lode or width of surface*, such claims heiug restricted and governed hoth as to their *lateral and linear* extent by the State, territorial or local laws, customs, or regulations which were in force in the respective districts at the date of such locations, in so far as the same did not conflict with the limitations fixed hy the mining statute of July 26, 1866.—(14 Stat., 251.)

3. Mining rights acquired under such previous locations are, however, enlarged by said act of May 10, 1872, in the following respect, viz.: The locators of all such previously taken veins or lodes, their heirs and assigns, so long as they comply with the laws of Congress and with State, territoriel or locel regulations not in conflict therewith, governing mining cleims, are invested hy said act with the exclusive posesessory right of all the surface included within the lines of their locations, and of all veins, lodes or ledgee throughout their entire depth, the top or apex of which lies inside of such surface lines extended downward vertically, although such veins, lodes or ledges mey so far depert from a perpendicular in their couree downward as to extend outside the vertical side-lines of such locetions at the surface, it being expressly provided, however, that the right of possession to such ontside parts of said veins or ledges shall he confined to euch portions thereof es lie between vertical planes drawn downward es aforesaid, tbrough the end lines of their locetions eo continued in their own direction that such planes will intersect such exterior parts of such veins, lodes or ledges; no right heing granted, however, to the claiment of such outside portion of a vein or ledge to enter upon the surface location of another claimant.

4. It is to be distinctly understood, however, that the law limits tbe possessory right to veins, lodes or ledges other than the one named in tbe original location, to such es were not *adversely claimed at the date of said act of May* 10, 1872, and tbat where such other vein or ledge was so adverecly claimed at that date, the right of the party so adversely claiming is in no way impaired by said act.

5. From and after the date of seid Act of Congress, in order to hold tbe possessory title to a mining claim *previously located*, and for which a patent hes not been issued, the law requires that *ten dollars* shall be expended annually in labor or improvements on eech cleim of *one hundred feet* on the course of the vein or lode until a patent shall have been issued therefor; hut where a number of such claims are held in common upon the eame vein or lode tbe aggregate expenditure that would be neccssary to hold all the claims, at tbe rate of ten dollars per hundred feet, may be made upon any one claim; a feilure to comply with this requirement in any one year subjecting tbe claim upon whicb such failnre occurred to relocetion hy otber parties, the same as if no previous location thereof had ever been made, unless the cleimants under the original location sball have resumed work thereon after such failure and before such relocation.

6. Upon the failure of any one of several co-owners of a vein, lode or ledge which bas not heen patented, to contribute his proportion of the expenditure necessery to hold the claim or claime so beld in ownership iu common, the co-owners who have performed tbe lahor, or mede the improvements as required by said act, may, at the expiratiou of the year, give such delinquent co-owner personel notice in writing, or notice by publication in the newspaper published nearest the claim, for at least once a week for ninety days; and if upon the expiration of ninety days after such notice in writing, or upon the expiratiou of one hundred and eighty deys after tbe first newspeper publication of notice, the delinquent co-owner shall have failed to contribute his proportion to meet such expenditure or improvements, his interest in the claim by law passes to his co-owners who have made tbe expenditures or improvements as aforesaid.

PATENTS FOR VEINS OR LODES HERETOFORE ISSUED.

7. Rights under pateuts for veins or lodes heretofore granted under previous legislation of Congress, are enlarged by this act so as to invest the patentee, his heirs or assigns, with title to all veins, lodes or ledges throughout their entire deptb, the top or apex of which lies within the end and side boundary lines of the claim on the surface, as patented, extended downward vertically, although such veins, lodes or ledges may so far depart from a perpendicular in their course downward as to extend outside the vertical side-lines of the cleim at the surface. The rigbt of possession to such outside parts of such veins or ledges to be confined to snch portions thereof as lie between vertical planes drawn downward tbrough the end-lines of tbe claim at the surface, so continued in their own direction that such planes will intersect such exterior parts of such veins or ledges; it heing expressly provided, however, tbat all veins, lodes or ledges the top or apex of wbich lies inside such surface locations, *other* than the one named in the patent, which were *adversely claimed* at the date of said act, are excluded from such conveyance by patent.

8. Applications for patente for mining claims pending at the date of the act of May 10, 1872, may be prosecuted to final decision in the General Land Office, and wbere no adverse rights are affected thereby, patents will be issued, in pursuance of the provisions of said act.

MANNER OF LOCATING CLAIMS ON VEINS OR LODES AFTER THE PASSAGE OF THE ACT OF MAY 10, 1872.

9. From and after the date of said act, any person who is a citizen of the United Statee, or who has declared his intention to become a citizen, may locate, record and hold a mining claim of *fifteen hundred linear feet* along the course of any mineral vein or lode subject to location; or an association of persons, severally qualified as above, may make joint location of snch claim of *fifteen hundred feet*, but in no event can a location of a vein or lode made subsequent to the act exceed fifteen hundred feet along the course thereof, whatever may be the numher of persons compoeing the association.

10. With regerd to the extent of surfece-ground adjoining a vein or lode, and claimed for the convenient working tbereof, the act providee that the leterel extent of locations of veins or lodes mede efter its pessage shall in no case *exceed three hundred feet on each side of the middle of the vein at the surface*, and that no ench surface rights shall be limited by any mining regulations to less than twenty-five feet on each side of the middle of the vein at the surface, except where adverse rights exieting at the date of eaid act may render such limitation necessary, the end-lines of ench claims to be in all cases parallel to each other.

[To he continued.]

MINING ACCIDENTS. — Edward Hayes was ceved upon, and hed bis leg brokon in the Cork Company's claims in Montana, two weeks since.

Alexander Corblin was killed at the Big Smoky Mill, Nevada, on the 17th inet, by being tbrown under the shaft while endeavoring to put the belt on the shaft which runs the pans.

MILL BURNED.—The Star quartz mill, boarding house, blacksmith shop, buildings, etc., on Rose Creek, American Camp District, Tuolumne county, was destroyed by fire on the 16th inst. It wae owned by P. B. Bacon of Columbia, and cost $10,000.

HINTS FOR INVENTORS. We will send on receipt of stamp for postage, FREE, our 52-page Circular, containing 112 Illustrated Mechanical Movements; a digest of PATENT LAWS; information how to obtain patents, and about the rights and privileges of inventors and patentees; list of Goverment fees, practical hints, etc., etc. Address DEWEY & CO., Publishers and Patent Agents, San Francisco.

MARAVILLA COCOA.—No breakfast table is complete without this delicious beverage. The *Globe* says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success had heen achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supercedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distingnish the Maravilla Cocoa above all others. For homeopaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all grocers, to whom also may he had Taylor Brothers' Original Homeopathic Cocoa and Soluble Chocolate Steam Mills—Brick Lane, London. THE FREAR STONE COMPANY

OF CALIFORNIA.

Office, 638 Market Street.

OFFICERS:

JAMES GAMBLE, President. | L. A. BOOTH, Treasurer.

EXECUTIVE COMMITTEE:

N. W. PEULDING. GEORGE O. POTTER, N. P. RINE. SPY

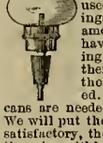
This Company will contract to furnish or put up the heaviest, strongest and most elaborate and elegant Fire-proof Stone Fronts, of any design, and every style of Plain and Ornamental Door and Window Caps, Keystones, Sills, Water Tables, Coping Ashlars, Plain and Ornamental St ne Work of every description. Fire-proof Buildings and Bank Vaults, Cemetery Work, Curbing Stones, Fountains, etc., all at prices far below native cut stone, and equal, in all respects, as to strength and durability.

Architects and Builders, before letting their contracts for Stone Work, are requested to call at the office of this Company, and examine certificates, specimens and photographs of buildings already constructed of Frear Stone in Chicago and other Eastern cities.

For further information apply to N. P. PERINE, 638 Market street. [19v24-3m

DREYFUS' PATENT SELF-OILERS,

For Shafting, Engines, Machines, Etc.



Save from 75 to 95 per cent. of oil used on shafting or machinery bearings. No better investment for the amount can be made by any person having machinery or running shafting. They are widely known for their reliability and economy. All the trouble of "oiling up" is avoided. There is no waste of oil, and no cans are needed A single trial will prove their value. We will put them into any mill, and if not perfectly satisfactory, they may be returned at our expense, and the price will be refunded. We have a large stock on hand, of all sizes, adapted to all description of boxes.

Send for Price List and Circular.

Address TREADWELL & CO.,
26v24 San Francisco.

MINING ENGINEER.

An Experienced Miner, why has superintended for the last twelve years the largest gold, silver, tin and copper mines in India, Burmah, and Japan, is desirous of obtaining a position as Superintendent of gold and silver mines; references given if required. Address W. B., Scientific Press office, 2v25tf

To Engineers and Millmen.

NATHAN & DREYFUS'

PATENT

Self-Acting Lubricators for Cylin-

ders.

Their advantages over other lubricators are so striking, that it is only a question of time for them to come into general use—their accuracy in keeping the valves and pistons thoroughly and constantly lubricated being unequalled. A close examination of this sectional view of Lubricating Cup will give an idea of its working.

The principle of working is based on an intermittent condensation of steam in the UPPER PART of the cup containing the lubricant. At every couple of strokes, the steam condensing, produces a drop of water, which, being heavier than the oil, sinks by its own gravity, and raises a corresponding drop of oil over into a tube, which arises in the center of the cup and conveys said oil directly to the chest and cylinder, this tube being the only connection from the Lubricator to the internal part of the engine. The water produced by the condensation is drawn off once a day by a side-cock, and the cup filled again with the lubricant. Another advantage is, that the condensing process refines the oil, as the water settling down thro' lubricant RAILROADS in the United States.

carries down salts and acids which may be contained therein. In this way corrosion of the steam chest and cylinder is prevented, the power of the engine improved, and an amount of packing saved. These Lubricators have been adopted on THOUSANDS of stationary and marine engines, steam pumps, steam fire engines, and locomotives by over EIGHTY

ROOT'S PATENT FORCE BLAST ROTARY BLOWER,

MANUFACTURED AT THE

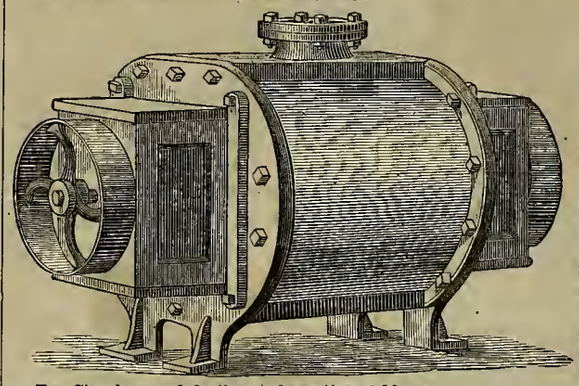
GLOBE IRON WORKS,

Stockton, Cal.

[End Sectional view showing the pistons and gearing.]

Awarded the First Premium at the Paris Exposition.—Patented November 1, 1864; July 24, 1866; and October 9, 1866.

Adapted for Smelting, Foundry, Mining and Steamships. Requires 50 Per Cent. less power than any Blower now in use.



One of these Blowers may he seen at W. T. Garratt & Co.'s Brass Foundry, San Francisco; Gould & Curry and Savage S. M. Co.'s, Nevada; and at C. P. R. R. Co.'s Works, Sacramento; and other places on this coast.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article. Quartz, Saw and Grist Mill, Iron, Stationary and Steamboat Engines, Horse-Power and Pumps, of all Sizes.

16v24tf

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

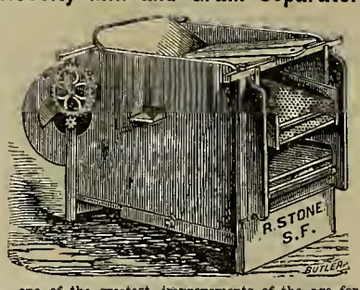
This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco.

THE PATENT
Novelty Mill and Grain Separator



one of the greatest improvements of the age for cleaning and separating Grain, while it combines all the essential qualities of a first-class Fanning Mill. It also far excels anything that has been invented for the separation of Grain. It has been thoroughly tested on all the different kinds of mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distioct qualities of wheat if desired.

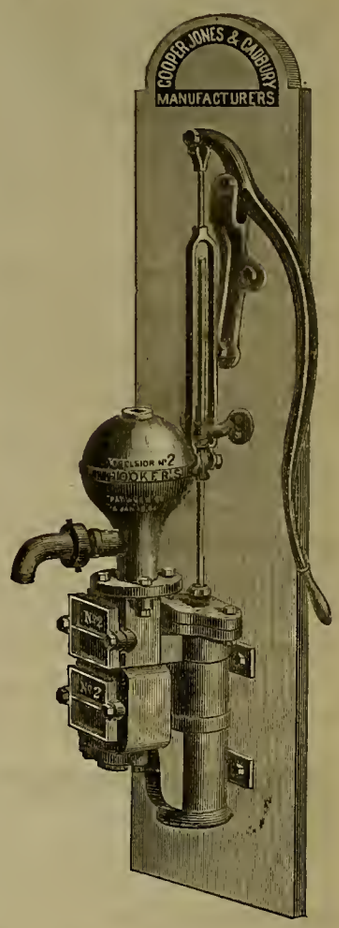

Fig.2

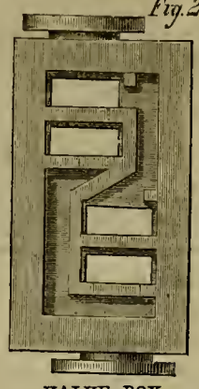

VALVE BOX.

VALVE.

We call the especial attention of all Millwrights, Miners and Farmers to this very superior Force Pump. It is more simply constructed, more durable, and has larger and more direct ports for receiving and discharging water, and warranted to furnish more water than any other pumps of equal caliber. It has Poppet Valves, which cannot be wrongly placed in the Pump. The Fair of the Mechanics' Inititute, held in the city of San Francisco, awarded the owners of this Pump FOR ITS SUPERIORITY, A FIRST PREMIUM AND SILVER MEDAL. Snitable for DEEP WELLS, Factories, Mining, Breweries, Sugar Refineries, Tanneries, Railroad Purposes, Drainage, Irrigation, etc. As the above Pumps are already in use in the principal Sugar Refineries, Factories, Rolling Mills and Gardens in this city, reference may be had where they are working. ☞ See Circular for particulars.

PACIFIC RURAL PRESS
DEWEY & Co.
PUBLISHERS SAN FRANCISCO
A FIRST CLASS
Agricultural Home Journal

THE PACIFIC RURAL PRESS is now in its fourth volume. Its columns contain a large amount of original information upon the different branches of husbandry on this coast. Its great variety of contents is properly systemized for the convenience of the reader, and ably prepared in pleasing language and style. Each number contains something of rare interest to every member of the household.

The state of this new field of agriculture, so different from all others; the new and improved methods of farming necessary here; and the absence of any published record of farming and rural experience on this coast, form a combination of circumstances which render a really good journal of greater importance to farmers here than are similar issues to farmers in any other part of the world.

The PACIFIC RURAL PRESS has been heartily received and well patronized, and its liberal success enables us to improve and enrich its columns from month to month.

Its reading and advertising matter is entirely chaste. All farmers should subscribe without delay. Every household should enjoy its richly filled pages.

Subscription, in advance, $4 a year. Single copies 10 cts. Four single copies, of late dates, sent postpaid for 25 cts. Address

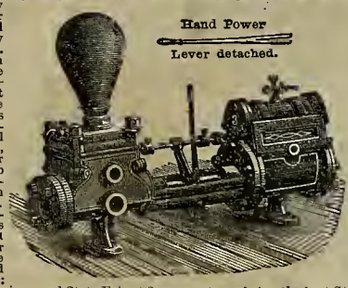
BLAKE'S PATENT STEAM PUMP.

These Pumps have been tested, and found to be indisputably without an equal wherever tried. They have been sold in the Pacific States now for upwards of 4 years, and we are willing every one in use may be referred to; every Pump will speak for itself. They are constructed in the most simple style, and built in the most thorough manner—especially calculated for simplicity, durability and power. Some of the advantages of the Blake Pump may be summed up as follows: It is positive under any pressure. May be run slow or fast, as may be desired. Will discharge more water than any others of the same dimensions. Has no leaky joints, the steam part being cast in one entire piece. The steam valve is perfectly balanced, is cushioned at each end, and slides with the greatest facility, having no cams nor complex Rotary Arrangements to get out of order. Will start at any point of the stroke, and will discharge all the water of condensation. The Pump has no crank or fly-wheel, thereby saving a considerable item of expense to the purchaser. Having no dead points, it therefore needs no watching, and is consequently ready to start without using a starting bar or any hand-work whatever. The Blake Pump is extensively used on Railroads and Steamboats; in Hotels; for Mining and Fire purposes; in Breweries, Tanneries, Sugar Houses, Factories, Mills, Laundries, and as Boiler Feeders, wherever steam is employed. In fact, wherever water or other liquids are desired to be raised in large or small quantities, or against heavy or light pressure, it is the cheapest and best Pump that can be used. It is offered to the public as the most perfect independent steam Pump ever invented. Forty different sizes are made, capable of throwing from 1,000 to 200,000 gallons an hour, and adapted to any class of work that may be required. Every Pump will be warranted to perform the work required of it by the purchaser, or it may be returned, and the money will be cheerfully refunded. The Blake Pump was awarded a Silver Medal at the Exhibition of Mechanics' Institute, San Francisco, and State Fair at Sacramento, as being the best Steam Pump on Exhibition. The agents have recently imported several of the largest-sized Mining Pumps for water works and deep mines, and will be pleased to refer parties to them; we claim for it, that it is the most simple and durable, and consequently the best Steam Pump ever built. For sale by TREADWELL & CO., Machinery Depot, old stand, Market, head of Front Street, San Francisco, who will be pleased to send circulars to any address, or show its advantages to parties calling on them.



THE GIANT POWDER COMPANY

Are now manufacturing besides the famous regular

GIANT POWDER, A NO. 2 GIANT POWDER,

Somewhat slower in its Explosion, which we recommend for

BANK BLASTING, COAL MINES,

AND FOR ALL SUCH WORK WHERE THE ROCK IS NOT VERY HARD

It is fully as safe as the other and evolves neither smoke nor noxious fumes when exploded.

Price. 50 Cents per Pound.

The sales of both grades increase very fast, which is the best proof of their superiority over other explosives.

OUR TABLE OF CONTENTS

Will comprise Full Prices Current and Monthly Review of the Wholesale Markets; Diagrams of the Fluctuations of the Produce Markets; Rates of Freight and Passenger Fares—corrected monthly; Illustrations and Sketches of Prominent Men and Buildings; Editorials on Manufacturing and Industrial Progress; Departments containing appropriate reading matter and reviews for various branches of trade, including "Grocery and Provision;" "Dry Goods;" "Trades and Manufactures," etc., etc.

Our first issue for May consists of 24 pages, embracing FORTY-FIVE COLUMNS of important reading matter—mostly original and by first-class writers. Sample copies, post paid, 10 cts. Yearly subscription, in advance, $1. Subscribers to the MINING AND SCIENTIFIC PRESS or the PACIFIC RURAL PRESS will be supplied at half price.

COMMENCING
Monday, April 29th, 1872.
And until further notice, Trains and Boats will
LEAVE SAN FRANCISCO.

7.00 A.M. Overland Express Train for Sacramento, Marysville, Red Bluff, Colfax, Reno, Ogden and Omaha.

3.00 P.M. San Jose Passenger Train, stopping at all way Stations.

4.00 P.M.* Passenger Train for Stockton, Merced and Sacramento.

6.30 P.M. Overland Emigrant Train, Through Freight and Accommodation.

7.30 A.M. Steamer New World (from Broadway Wharf) —Connecting at Vallejo with Trains of California Pacific Railroad.

4.00 P.M.* Sacramento Steamer (from Broadway Wharf). Connecting at Vallejo with trains of California Pacific Railroad.

2.00 P.M.* Steamer Antelope, from Broadway Wharf, connecting at Donahue with Trains of S. F. and North Pacific Railroad.

8.00 A.M. Excursion Boat (Sundays only) from Broadway Wharf, connecting with Special Train of S. F. & N. P. R. R. for Cloverdale and intermediate points, returning to San Francisco by 7 P.M.

OAKLAND BRANCH.—LEAVE SAN FRANCISCO, 7 00 8 10, 9 20, 10 10 and 11 20 a.m., 12 10, 1 50, 3 00, 4 00, 5 15, 6 30, 8 06 9.20 and *11 30 p.m. (9 20, 11 20 and 3 00 to Oakland only).
LEAVE BROOKLYN, *5 30, 6 40, 7 50, 9 00 and 11 00 a.m., 1 30, 2 40, 4 55, 6 10, 7.40 and 10 10 p.m.
LEAVE OAKLAND, *5 40, 6 50, 8 00, 9 10, 10 00, and 11 10 a.m., 12 00, 1 40, 2 50, 3 50, 5 05, 6 20, 7.50 and 10 20 p.m.

ALAMEDA BRANCH.—LEAVE SAN FRANCISCO, 7 20, 9 00, and 11 15 a.m., 1 30, 4 00, 5 30, and 7 00 p.m. (7 20, 11 15, and 5 30 to Fruit Vale only).
LEAVE HAYWARDS, *4 30, 7 00 and 10 45 a.m., and 3 30 p.m.
LEAVE FRUIT VALE, *5 25, 7 35, 9 00 and 11 20 a.m., 1 30, 05 and 5 30 p.m. *Except Sundays.

VOLUME XXV. Number 5.

The Goodwin Pump.

We herewith present our readers with an engraving of the Goodwin pump, now on exhibition at the Miners' Foundry, No. 235 First street, in this city.

This pump is another evidence of the tendency of modern mechanics to substitute rotary, for rectilineal, and continuous for intermitting movemente.

The reciprocating cyliudrical pump is one of the most perfect machines of its class, but the inertia of the water must he overcome at every stroke. In double-acting pumps and those supplied with air-chambers this defect is remedied to a certain extent, hut the original difficulty still exists. No reciprocating pump or ordinary combinations of them will throw a *perfectly* uniform stream. However a very high degree of uniformity is not necessary, except for fire-engiues, hydraulic miniug, and kindred uses.

Ewbank one of the highest hydraulic authorities forty years ago, spoke of the rotary pumps as heing perfect in theory, and the difficulties in their way as heing mechauical. These heing overcome, the rotary pump is as perfect in practice as in theory.

The lathe, planer, shaping machine and other appliances of modern machine shops render practicable the constrnction of machines which would he impossible without them. The Goodwin Pump is an illustration, as without the improved manufacturiug tools of the present day, it could not he rendered practical.

Thie pump, which operates hoth hy suction and forcing, is composed of an outer and inner cylinder with a circular space hetween them, which is the pump chamber. Iir the engraving the outer immovable cylinder is marked *A*. The inner and movahle one is not seen, heing covered hy the adjusting ring *I*; this cylinder is supported hy the friction rollers *K, K*, which revolve on the eccentric *H*, which is secured to the shaft *G*, hy a regulatiug gib-nut shown in the cut. Any wear on the periphery is taken up hy the gih and if the ends hecome loose they can he tightened hy the adjusting ring, *I*. By means of the rollers, *K. K.*, nearly all of the friction is rendered rolling instead of sliding. In a trial they were clamped so as to prevent their rolling, aud the power required to run this pump was nearly if not quite doubled. The ahutment, *M*, is used only to close one end of the pump chamher aud no water ever passes through it. By means of rollers not showu in the cut, it is fastened to the revolving cylinder, consequently there is no jar or concussion in ite movements, neither ean it he ohstructed in its operations like a valve hy chips or gravel. The engraving represents a single acting pump provided with an air chamher which is unnecessary in a double-acting one which throw a perfectly uniform stream.

Owing to the strength and durahility of its materials (being entirely iron) and having no reciprocating motion except in the ahutment, this pump can he run safely at a very high degree of speed. Two hundred and fifty revolutions per minute can he given to one twenty inches in diameter, and a model of three inches has been run 3,200 per minute. As this pump has no valve to choke, it is unsurpassed for a ship pump, and water containing corn or graiu can he pumped with perfect facility.

It ie aleo adapted to deep miues where a large amount of water is raised to a great hight, the high degree of speed at which it is run admits the use of much smaller pipes than elower moving pumps. It is one of the hest pumps to attach to a wiudmill, as a variation in speed does not affect its efficiency, and is just as safe in a gale of wind as in a gentle breeze. For hydraulic miuing aud firo engines it is peculiarly adapted, as it throws a perfectly uuiform stream, and can he made of sizes to throw from five to six hundred inches, miners' measure per minute. The one at the Miners' Foundry has a capacity of 1,200 inches per minute.

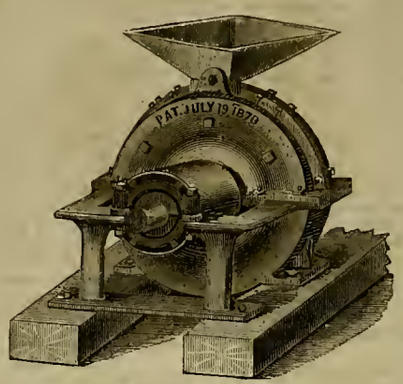
For further particulars enquire of S. A. West of the firm of Goodwin & West, at the Miners' Foundry, where these pumps are manufactured.

REDUCTION WORKS. Promineut capitalists of Denver and Georgetown and an experienced mining engineer of Nevada are ahout to erect extensive reduction works in Clear Creek county, Colorado. The Denver *Tribune* says that ores that contain less than an average of $100 per ton in silver ore are valueless there, hecause they will not pay to ship; hut the establishment of these works will render thousands of tons of this class of ores available.

COAL has heen found in the Coast Range, eixty miles weet of Visalia. The croppings are said to he seventy-five to 100 feet in length, hy ahout ten feet in width. Specimens of copper ore and cinnahar were also hrought from the same regiou.

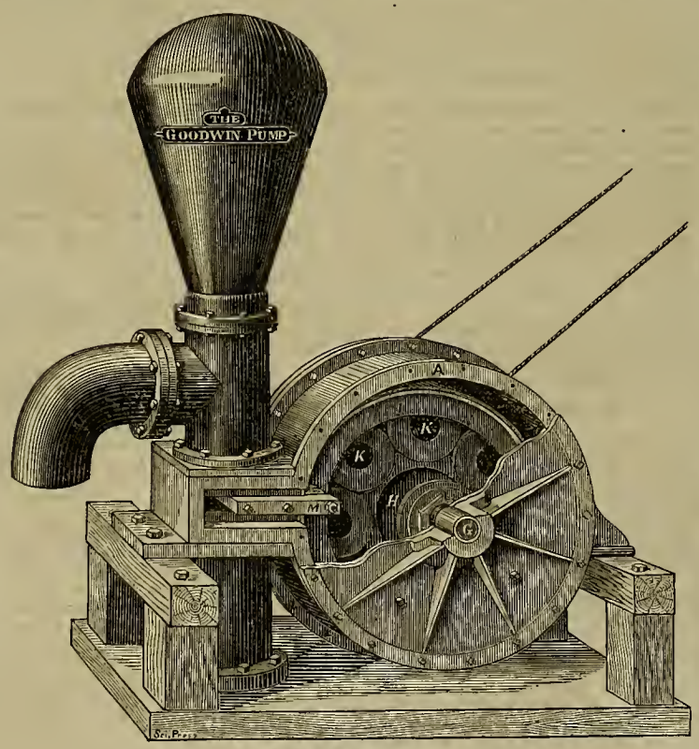
The Lightning Mill.

The accompanyiug cut represents a crusher which is made hy Messrs. Walker Bros. & Co., of Philadelphia. The general appearance of the mill reminds one of an ordinary fan hlower with the hopper attached. It is no new experiment, for mills made hy these parties have heen running for some eighteen months, and are said to have given general satisfaction.



THE LIGHTNING MILL.

It consists of an outside frame, or case, with an inside lining, ahout an inch from the outside. This inside case is made of chilled iron, and when in the course of time it hecomes worn it can he easily replaced. The pulverizing part of the mill consists of a spider made of heavy wrought iron, on which are fastened heaters or paddles, which as they get worn off can he reversed and then turned so as to expose the other side, and again reversed, thus giving four wearing surfaces, and when condemned as totally worn out can he replaced in from ten to fifteen minutes.



THE GOODWIN PUMP.

The guaranteed capacity of these mills is from five to fifteen tone of quartz in ten hours, although during a short run of twenty hours, hnt recently, one of them run off the whole twenty tons at an average of one ton in forty-five minutss, fine enough to pass through a number eighty holt. Any one having any knowledge of the refractory nature of Lake Superior iron ore would perhaps have a hetter idea of the efficiency of the mill when we state that they grind ten tons of this fine euough to pass through an eighty holt, in ten hours.

Agaiu, they have pulverized fifty tons phosphate, or Charleston rock, in ten hours. They have a mill in Philadelphia now rnnning and pulverizing horn and hoof at the rate of teu tons in ten hours, thus making an invaluable manure, which is in great demand in England, and the supply is not equal to the demand.

These are instances of what the mills have done aud are doiug, and not merely a trial performance; but the details of which the manufacturers will he happy to furnish to any one interested in such matters.

As it is a well-known fact that to drive a 30-inch fan requires an expenditure of six-horse power, it would he ahsurd for anyone to make the assertion that this or any other mill working on the same principle can he run with little power, although, considering the amount of work done for the money, and power required, there would seem to he no mill so economical. However, the huilders recommend 15-horse power to run their mill, although considerahle of the work specified was done with a 10-horse engine.

They ground 98 tons of green hone, just as it came from the market, without steaming, dryiug, or any other preparation, with one set of heaters, at a cost of only 3¼ cts. per ton. The weight is another advantage in its favor, over stamp mills and other hcavy machincry, as this weighs only 2,000 lbs., and can he so taken apart that the heaviest piece only weighs 800, thus rendering it easily transported to places in the monntains almost inaccessihle to heavy machinery. The price is such that it commeuds itself to those small miners who have not means to huy expensive tools to develop their mines. The present price at the works is only $500, although the proprietors think, from the demand, they will he justified in advancing it. They have mills running on gold quartz in Virginia, also in North Carolina, and are now huilding a mill to go to Chili, and are desirous of making arrangements with some capahle and responsible person engaged in milling or huilding machinery in California to assist them in introducing it. Parties desirous of fnrther informatton in regard to it are requested to communicate with the inventors as per advertisement in another column.

STATE UNIVERSITY.—At an adjourned meeting of the Board of Regents of the University, held on Tuesday last, Prof. D. C. Gilman, of Yale College, and Pres. of the Shefficld Scientific School, was elected to the Presidency of the State University. We cougratulate the people of California on this election.

Although five hlauk votes were cast hy voters who preferred some one who might already be a citizen of our State, we have heard the positive assertion that three of the five assert they will give the president elect their hearty support, as no douht will the two others unheard from—judging from their natural geniality and good sense. The ahle and worthy memher of the Board, who had been urged as a candidate hy his friends declined with the positive assertion that he had not sought an election. We helieve the result is a fortunate one for the University, and the actiou of the Regents in this instance will he glorified with grand results that will certify to their wisdom generations to come. Prof G. will find a rich field and a fine opportunity for his nohle lahors in the highly important position to which he hae heen elected. With fair management, our Univereity has a hright future, liherally supported ae it may he hy the most intelligent aud progressive community in the Uniou.

CORRESPONDENCE.

Notes of Travel in White Pine Co., Nev.

[By our Traveling Correspondent.]

Hamilton,

The county seat of this County, contains ahout 900 inhahitants, and is locatsd 120 miles a little east of south, of Palisade on the C. P. R. R. the point at whioh the traveler leaves the railroad to take Woodrnff & Ennor's stages to this place. The total distance from San Francisco is 693 miles, and the cost of fare $63; the time occupied in transit is 55 hours. The town of Hamilton is situated at an elevation of 8,108 fest ahove sea level, and at this season of the year, has the most delightful climate on this coast; thnnder, lightning and copious showers of rain are not unfrequent here at this season of the year, three showers having occurred during my short stay of ten days. The interesting phenomena of a hnrsting rain-cloud is also a common occnrrence, in this part of Nevada.

The White Pine Mining District,

Is in the eastern portion, and not far from midway hetween the northern and southern houndaries of the State; Treasure Peak, ahout which the principal mining operations have thus far heen in progress, heing in latitude 39° 14′ North, and, longitude 115° 27′ west from Greenwich.

The White Pine Mining District includes an area of twelve miles sqnare, having Treasure Hill, ahout which the most important mines are clustered, as a central point. This hill is an isolated ridge, ahout three or fonr miles long, measuring from the extremities of the hase, and from a half to two and a half miles wide. Its longer axis is nearly north and south, parallel to the general trend of the White Pine or Pogonip mountain, from which it is separated hy a narrow valley, and intermediate but lower parallel ridge, on the northwestern side, known as the Base Metal Range.

Treasure Hill

Lies east of White Pine mountain, aud its eastern slope descends steeply, and, in some places precipitously to Applegarth Cañon, which ssparates the hill from the next eastern range, known as the Moke-Moke Hills. The north and sonth slopes of the hill are gentler than the eastern and western. The town of Hamilton lies near the foot of the north slope, and on the southern and sothwestern slopes are the towns of Eberhardt and Sherman. The Standford mill and the International mill, the former belonging to the South Aurora S. M. Co., (limited) and the latter to the Eberhardt and Aurora M. Co., (limited) are situated at Eherhardt City.

The highest point of Treasure Hill, known as Telegraph Peak, is 9,228 feet ahove ssa level. The peak of White Pine Monntain is 10,792 feet above sea level.

The ore of Treasure Hill occurs in chambers, or pockets of variable forms and dimensions, and the distrihution of these deposits over the area of the hill and in the various limestone strata, althongh, perhaps, hetter understood than at first, is very irregular and in accordance with no clearly defined law.

The First Discovery

Of silver bearing lodes in this district was made in the autumn of 1865, on the wsst side of White Pine Mountain, and two ysars elapsed hefore the more important ore hodies of Treasure Hill were brought to notice. The Eberhardt mine was located in January, 1868. The fame of the discoveries made there attracted thonsands of people, and in the summer of the same year prospecting and mining was vigorously carried on. The ores found on the surface and first worked, contained some very rich lots. One lot of twenty-two tons, from the Eherhardt, producing $96,000.

Mr. Hague, in his report, estimates the total production of the district to the first of July, 1871, at $5,300,000, coin valne, to which may he added the production of hullion to the first of July, 1872, not less than $1,800,000, making a total $7,100,000.

Sometime in the fall of 1867 an Indian took a specimen of ore to the Newark mill (twenty-eight miles N. W. of Hamilton) and showed it to the hlacksmith "Lsathers," who accompanied the Indian to Treasnre Hill and located the first mine thereon, known as the Original Hidsn Treasnre. The nsual excitement followed the discovery, and a husy mining camp was established hers in 1868. Towns were located and incorporated as well as thousands of mines to the great advantage of the then Recorder. Treasure City is ahout two and one-half miles from Hamilton.

From the highest point known as Treasure Peak the City of Hamilton liss 1,120 fest helow; the City of Eherhardt lies1 ,920 feet helow, and that of Shermantown 1,780 hslow, and Trsasure City is locatated near the Summit.

Ths distance from Shermantown to Hamilton is ahout four and one-half miles and to Treasure City hy road two and one-half miles. The distance from Eherhardt to Hamilton is ahout five and one-half miles hy road, and by road five miles up to Treasure City.

Ths limestone of Treasure Hill in which the ore deposits are formed is of the upper silurian period. The character of the silver ore found is chloride of silver, horn silver, manganese, lsad, iron, copper, and other base metals are occasionally found mixed with it.

The Mines.

Ascending the hill from Hamilton we pass numerous mines, the hetter known bsing the Mammoth, East Shehoygan and the Virginia, Original Hidden Treasnre, South Hidden Treasure, Bnllion, Sierra Nevada, Ward Beecher Consolidated and the Ward Beecher, Idaho, East and West, North Aurora, and Iceberg. The latter six helonging to the Eherhardt and Aurora mining Co.

To the east of these lie the Golden and Mount Vernon. The South Aurora adjoins the North Aurora mine, to the west of which is the Chloride Flat and Genesee, helonging to the S. A. M. Co., and a number of mines in the Chloride, Bromide and Pogonip Flats, helonging to varions parties; 450 feet helow lies the Eherhardt, East and west, and a host of locations extending down Mahogany cañon to the south.

The most extensively developed mines are those belonging to the

Eberhardt and Aurora Mining Company

Of London. There are 3 shafts on the Ward Beecher mine, 2 in the North Aurora, and 2 in the Eherhardt. The deepest workings on the Ward Beecher are 129 feet from the surface; those on the North Aurora 150 feet, and on the Eherhardt 184 feet. The only hoisting engine on the hill is placed so as to hoist from the Ward Beecher, and the north end of the North Anrora mines.

The largest and finest hody of ore yet developed on the hill is fonnd at the sonth end of the North Aurora mine. Two large chambers known as the Ridsdale and the De Pass, are now heing worked. The ore is dropped down a shaft which communicates with a tunnel at a depth of 60 feet, which runs south through the S. A. Co.'s ground. The ore heing run out through this tunnel is shipped hy teams or tramway to the company's mill at Eberhardt City.

The chief foreman in charge of the company's mines is Mr. Joseph Potts, a practical miner of great experience, good judgment and indomitable energy. A

Wire-Way, Hodgson's Patent,

(Or tramway) is laid down so as to connect the company's mines with the mill. The length ahont 2¼ miles, douhle line of rope made of steel ⅞ of an inch in diameter. The course of this wire-way from Treasure Hill to Eherhardt is down the Mahogany Cañon, over a very steep, precipitous rocky ground.

The rope passes over pnlleys snpported on some 50 supports, the highest of these hsing 130 feet from the level of the ground. The rope is driven by an engine at the mill. The ore is put into wooden boxes, which contain about 200 lbs. each; these are attached to a saddle which rides the rope hy iron hangers, and in reaching the terminus at the mill are unloaded, and the empty boxes passed on the other side of the rope, and re-ascend to the mines.

This wire-way travels at about 3 miles an hour, and can empty easily about 10 tons per hour.

The International Mill,

Belonging to this company is of 60 stamps, and was huilt hy Booth & Co, of San Francisco in 1870. It has bsen already described in the MINING AND SCIENTIFIC PRESS. It is located at Eherhardt City, and kept steadily running on this company's ore.

The following is a complete list of

Men Employed,

Together with the positions they fill in the Ward Beecher and North Aurora mines.

Jos. Potts, Mining Supt.	1
Foremen in mine	8
Foremen on surface	2
Time keeper (and clerk)	1
Blacksmiths	3
Helpers in shop	8
Engineers	2
Carpenters	2
Assorters	12
Top hands—(surface)	22
Oar men	8
Wheelers and shovelers—(underground)	18
Bucket landers	2
Miners	58
Total	137

They employ forty-two additional msn, at their mill in which the dry crushing proccess has been adopted.

Ths crushing capacity is ahout eighty tons per day. Mill forsman, Mr. J. R. Williams, a first-class mechanic and a man of considsrahle experience on this Coast. The

Scarcity of Water

In this district is seriously felt, especially during the summer months. The only constant and reliahle source of water supply is found in a deep cañon running in an easterly direction from the Moke-Moke ridge, and about three miles from Hamilton. This fact induced a company to construct very extensive works here with a view of supplying the various cities and mills in this new mining district.

With the object of securing a ready and constant supply of water, the Eherhardt & Aurora Mining Co. very wisely seized the opportunity offered, of purchasing the

White Pine Water Works,

And thus readily command the supply of water to the district. The Superintendent of these works is Mr. Robert Robinson, a gentleman well known for his practical ahility and experience. He has until lately been Superintendent of the Stanford mill, and at present superintends the amalgamation process at the International mill. The White Pine water works snpply the cities of Hamilton, Treasure and Eherhardt and most of the mills in the district.

A Galvanic and Electric Quicksilver and Amalgam Saving Apparatus

Is now practically at work at the Eherhardt & Aurora mill, working one-third of the tailings and giving good results. It works one agitator, saving fifty pounds of quicksilver monthly independent of the amalgam, this is after passing all the other processes of milling. (A patent for this is now heing applied for through yonr agency hy J. Potts, the inventor, Treasure City, Nev.) The mines of Treasure Hill in my next.

L. P. MC.

[To be Continued.]

Giant Powder in Bank Blasting.

EDS. PRESS:— In yonr issue of the 5th inst. appears an article on hank hlasting, with nitro-glycerine powder, in which yonr correspondent, "Blne Gravel," makes so many misstatements calculated to deceive the mining pnhlic, that I heg leave to reply, giving the true facts concerning the experiments made with Giant and Hercnles powder at Dutch Flat. "Blue Gravel" says:

"The Giant No. 2 was fired in a hody of ground in the deep shaft claim known as the Island. This body of gronnd was about 200 feet sqnare, with a face of 85 fest high, and an average depth of something over 90 feet. It was well relieved on two sides, and partially relieved on the other two, by heing washed down, as is nsual in hydraulic mining.

"Ahout the center of this Island a drift was run in to 58 feet from the front, and a cross-drift rnn on one side 28 feet, and on the other 40 feet. At the ends of this cross-drift, or T, 2,100 pounds of the powder was placed; the halance, 400 pounds, heing placed in a body of hard cement, extending in front from the main hank about 40 feet, and 18 feet deep, into which three small chamhers were run for deposits for the powder. These separate charges were all fired simnltaneously hy electricity."

The real facts of the case are as follows: The shot was in Deep Shaft claim (the title of "The Island" is unknown to the residents of Dutch Flat, and consequently mnch has originated in the visionary hrain of "Blue Gravel.") Face of hank 94 feet high, hank over powder line 100 feet. By the explosion 235 by 225 feet of gronnd were broken. The shot was hadly bonnd, on *all sides*. The hody of hard hlue cement in front of main bank was 60 feet in length and 30 feet deep. The main face of hank, a semi-circle. Of the result "B. G." relieves himself as follows:

"The small bank of hard cement in front was thoroughly pulverized and rendered in good condition for washing. The large hank had numerous cracks through the surfacs, immediatsly over the powder, and sxtsnding for some distancs hack—and some of them reaching nearly or quite across the hank, hut nons of the hank thrown down, as is nsnal with blasts of the common blasting powder.

"This hlast was exploded on the 22d of May, and washing commenced ahout two days after that date. The small hank in front washed well.

"Soon after piping was commsnced on ths main hank, a large hols or cavern was discovered in an angle of the face, nearly 40 feet high, and reaching back to an unknown depth. This at first was supposed to hs the effects of one of the large deposits of Giant Powder; but on contInning washing for two wssks, it was discovered that the cavern had no connsction with that hlast, but was the result of a hlast of common blasting powdsr, which was fired some three years ago, one chamber of which was not washed out; the water of that season failing hefore it was reached.

"There seems to he a firm wall of cement standing beyond the reach of the black powder hlast; but the men working in the claim feel confident that they will soon get some caves from the Giant blast, and feel very hopeful that the hlast is a good one."

It makes hut little difference whether the cavern was made hy hlack, or Giant Powder, one fact is well known, that is, that 900 inches of water, with 280 feet of pressnre, could not cnt the hank prior to the giant shot, that "wipes out" blue gravel's assertion, that one chamber of a hlack powder hlast had not been washed away on acconnt of water failing. The first cave from the bank, after the giant explosion covered the monitor (100 fest from the hank). After washing on this hlast for fourteen days, the Dutch Flat Water Co. cleaned up more gold than from any other vein ever made in this claim. In proof of the "breaking qualities" of Giant powder, the gold was all found, in the first eight or ten hoxes, while when black powder was used the hank came down in lumps, and the gold was found at the lower end of the flume, and we douht much was lost hy going over the dnmps in chunks of cement. Messrs. Bradley and Gardner, owners, and Roht. Clifford, Supt. of this claim will attest to the above, bring the true facts and also to the success of this experimental hlast; the hest proof of which, is, that the California Powder Co. owning immense hlack powder mills at Santa Cruz (worth at least $500,000) and also the Hercules powder works (since blown up) on the the ocean road followed in my wake and fired an experimental shot of Hercules powder in the Badger claim, thus aiding me in my endeavors to prove that nitro glycerine powders would hreak hanks of cement and gravel. As an experimental shot it too was a success, though I am again compelled to contradict "Blue Gravel" who thus commented on the Hercules shot:

The Hercules Powder Blast

"Was exploded on the 9th inst., also by electricity, in the Badger claim, in a bank similar in many respects to that in which the Giant was used, both banks heing of well cemented gravel, and free from layers of sand. The bank was something over 200 feet square, of irregular shape, with an average depth of 77 feet. The face was of the shape of the inner or concave front of a horse-shoe, and about 65 feet high. It also had one side partially relieved by a washed out ravine."

In this he would have the miners infer the Hercules powder had the most work to do, while it was just the contrary. No hetter place could have been found for a shot than the Badger claim. The face was 60½ feet high, the bank over the powder line 77 feet, the face well up, the top overhanging the bottom. The bank is compact red cement, while the Deep Shaft claim has a hlue cement bottom, over-capped with an immense layer of boulders (some weighing five tons and so numerous are they that whole days are spent in blasting them.) Over the houlders is a red cement and gravel—in trnth the only similiarity in the claims is that they are both hanks. Mr. Gifford, Supt. of Deep Shaft claim, says he saved $200 in putting down flume hoxes alone since the Giant powder shot, and it is to the iuterest of every gravel and cement miner to consider on, and try explosives that work up the hottom as well as the top of his bank. The extra money paid for powder is more than saved in time and water, if not in the extra gold alone ohtained, by having cement and gravel thoroughly pulverizsd.

As for "B. G.'s" comments on its (Giants)

costing fifty cents a ponnd, I can only say, that he sang tho same song four years sgo when Giant powdor was first introduced, saying no miner or mine owner could afford to nse it; yet the sales has increasod to 400,000 pounds a ycar. For the truth of my sccount of tho "blasts" at Dutch Flat, I refcr to Messrs. Bradley, Gardnor, H. C. Kelscy, John Simons, Robert Gifford, Eddy, Sam. Higgins, H. Nichols and Bailey—sll practical minors, and residonts of Dutch Flat.

OSCAR W. WHITE.

Cherokee Flat, Cal., July 19, 1872.

SCIENTIFIC PROGRESS.

Manageable Balloon.

Tho Advocates of the possibility of utilizing the balloon for tho every-day purposes of life have been greatly encouraged hy the rosult of a sories of experiments lately made in Paris by M. Dupuy de Lome, and recently communicated to tho Academy of Sciences. This gentlemau is an eminent French ongincer, and well acqnainted with both the theory and practice of his profession; and his attention was ospecially called, dnring the siege of Paris, to the importanco of having a halloon which possessed somo power of stocrage.

He has completed the first constrnction accoording to his new plan, and made, as he claims, entirely successful exporiments with it. The balloon is in the shape of an enormous egg, the longer axis is horizontal, with an oblong bar suspended from it. The total length is 118 feet, and its diameter at the point of greatest circumference 49 feet. The rndder by which the balloon is steered is a plain triangular surface, made of unvarnished calico, and constructed so as to turn easily on its forward extremity. Tho car is of wicker-work, containing a windlasa for the screw, eight mon to manage it, and is capable of carrying fourteen persons.

The rudder is fixed to tho balloon itself, and the screw is below it and immediately attached to the car, and having only two blades, so that when the ground is touched they can be placed horizontally to escape injury. The windlass which turns the screw is worked by four to eight men. The envelope of the balloon is eomposed of white silk.

The constructor does not pretend to be able to make a direct movement against the wind, but only to deviate from its direct set when running hefore it. He expects to be ahlo to taek to the right or left, hnt does not hopo to be able to beat to windward. There is a second balloon attachmont to the hottom of the main halloon, forming a kind of compartment, occupying ahout one-tenth of the oubic space of the balloon, and serving to keep it stiff and of the required shape.

In the experimental trip of M. De Lome a half gale was blowing, and the result answered entirely to his expectations. The screw drove the halloon about five miles an hour quicker than the wind was blowing, and by the use of the rudder the course of the balloon could be altered eleven degrees, either way, from tho set of the wind.

IRON IN THE BLOON.—Boussingault finds tho amount of metallic iron in aliments as follows: the minimnm, in carots, 0·0009 gram; tho maximum, in the blood of hogs, 0·0534; in beer, ·0040. In vertebrates the quantity of iron does not exceed a thoueandth of the weight; in invertebrates, probably not four ten-thousandths. It is usual to attribute the rod color of the hlood to the presenee of iron. Yet the white blood of invertebrates contains almost as much iron as the red of vertebrates. Also, plants not green, like mushrooms, contain as much iron as the green plants. Boussingault eonclndes that of all substances the blood is that which eontains the largest amount of iron, and of assimilable iron, since it has already bcen assimilated.

THE WEATHER AND THE GULF STREAM.—It is worthy of notice that although the weather during the last few months has been altogother remarkahle—the winter unusually mild, and some of the spring months singularly bleak—we have heard scarcely anything of our ouee familiar friend the Gulf Stroam. Those who used to be most ready to ascribe all weather peculiarities to its influence, seem afraid now even to mention its name. The notion has spread abroad, that the Gulf stream is a detected imposter, a convicted sham; having no more to do with our climate (or rather with our weather), than "with the ripening of oranges at Naples, or the maintenance of Catholicism at Rome."

USE OF POTASSIUM IN SOILS.—Aecording to Nobbé, the prcsence of potassium in soils is necessary in order to enable tho chlorophyll grains of the leaves to form starch, sodium and lithium being nnable to replace potassium in this funetion, the latter indeed being actually injurions. He has also ascertained that the different combinations of potassium vary very much in their value, the chloride being by far the tsom efficacious.

METEORIC IRON FROM EL DORADO CO.—Prof. Shepard, of Amherst College writes in substanee as follows to the *Am. Jour. Sci.* For my knowledge of the meteoric iron of El Dorado Co., Cal., I am indehted to M. A. Stebhins, hhrarian of the Mercantile Library, San Francisco, who sent me a few grains of turnings obtained during the separation of a slico destined for tho Cal. Geological Survey collection. The mass is described by Mr. Stebbins as having the size and shape of a man's head. It was fonnd in a field, taken to a blacksmith's shop, where it proved uamaaageahle in working, and then fell into scientific hands. Ite surface possesses the indentations common to these bodies, the crust or coating being partially oxidized. It weighs 85 lbs. I find the turniugs to have a speeifie gravity of 7.80, which may perhaps he a trifle above what the mass possesses as it is presumable that the turnings have suffered a slight coadensation in the process of separation. The fragments aro far from all trace of sulphur. A singlo analysis upon one grain hes afforded me:—Iron, 88.02; nickel, 8.88: Insoluble, consisting of a mixture of iron protoxide and peroxide, witb minuto silvery particles of supposed phosphor-metal (Schreibersite,) 3.50; Total, 100.40. The amount of material at eommand was too smsll to search for tho othermetals commouly found in metooric irons.

THE BLAKE CAUSHER has made its appearance as a witnes in the field of geological inquiry. Dr. Mitchell exhibited at a late soirée of the British Institution, a series of flints hroken in this machine, the object being to prove tbat hy the natural fracture of flint, flakes and ehipping are produced, which in tho minutest details coincide with those flint flakos whieh havo been so largely collocted, and commented on as beiug the rude implements of the early races of man. Dr. Mitchell also showed a variety of broken flints pieked up in gravel roads, which wore also identical with the typieal forms, which have been described as precursors of tbose arrow-heads, etc., which are evidently manufactured artieles. Of course the argument was that much of what we take to be tho work of man, is but the natural result of the fracture of flint stones by accidental means, and we must therefore be careful in ascribing to man's agency the produetion of these peculiar stone implements, when we find them under such eircumstances as associate the time of thoir origin with somc too distant geologic age.

A NEW FLUORESCENT BODY.—Presidcnt Morton of the Stevens Institute, announced in a recent lecture that, in the course of the oxamination which he had been making on snbstances of this olass, he had encountered one which he believed to be as yet nnknown, and which possessed the property of developing light by fluorescenee in a pre-ominent degree. This body was obtained from petroleum, and he would propose to take for it the name "viridine." The word viridine had been alrcady applied as a synonyme for chlorophyll, but was now practically obsolote, and too appropriate to the present snbstance to be thrown away. A large drawing of a flower, with leaves painted seemingly in light nmber tints, was then shown and illuminated by electric discharges when it appeared of the most vivid green. The peculiar fluorescent spectrum of this body, and its relations to the spectra of other substances was explained, and many other illustrations were exhibited.

CAUSE OF THE BLUE AND VIOLET (INTERCHANGEABLE) COLORS OF FISHES.—G. Pouchet finds there is a constaut and natural cause for the bluish or violet variable color of some fishes. There is under the skin a layer of small irregularly spherical granules, yellow by transmitted light, which is the source of the color, this color being a complementary one to the yellow. Tho diamcter of these *irising* granules varies from 2 to 4 or 5 thousandths of a millimeter; and each is formed of a pile of extraordinarily thin lamellæ, applied one to the other, but separately distinguishable under the microscope. Pouchet concludes that the color is due to a kind of fluorescenca.

NEW MODE OF REFRIGERATION.—M. Fosselli has announced to the French Academy of Sciences that he has succeeded in producing an amount of cold just below the zero of Fahrenheit scale hy simple mechanical action creating rapid evaporation. He employs a wheel formed of a spiral tube, both ends of which are open, set vertically and half immersed in the fluid to be cooled, so that the latter passes constantly through the whole length of the tube, half of which is eonstantly above the liquid, and, being wet, gives rise to active evaporation and consequent refrigeration within it.

COPPER IN COCOA AND CHOCOLATE.—Carefnl chemical analyses show that cocoa and chocolato always contain a small percentage of copper. The husks of the cocoa have been found to contain as high as 0.025 per cent of copper, while the kornel of the bean only contained 0.004. Samples of chocolate contained 0.0125 of copper. Substances containing copper, even in the smallest proportions, cannot be very desirable for the diet of invalids, for which the above articles are quite extensively used.

ILSEMANNITE, A NEW MINERAL.—A mineral which has been termed ilsemannite has lately been described as new by Höfer, and as occurring in some heavy spar from Bleiberg. From its chemical composition it is believed to be a product of the decomposition of wulfenite.

GENERATION OF OZONE.—According to Dr. Pincus, if perfectly dried hydrogen ie caused to burn, in a very small flame, from a jet ending in a very fine point, the smell of ozone is very distinctly perceived, and it becomes more conspicuous if a dry and clean beaker-glass is held over the flame. When, by the aid of a properly contrived apparatus, the combustion takes place in pure oxygen, the samo phenomenon is observed.

NEW THEORY OF FERMENTATION.—Mr. A. Petit, in *Comptus Rendus*, puts forth the following new theory of fermentation:— Tho sugar, in presence of yeast-globulos, decomposes water. Tho oxygen combines with the yeast; the liberated hydrogen unites with a molecule of sugar and destroys it, producing alcohol, carbonic gas and hydrogen, which again decomposes a molecule of sugar, and so on.

A NEW PHYSICAL LAW.—M. Valson announces in *Les Mondes* that from the researches he has made he concludes that the following is a new law in physics: For all uormal solutions—that is to ssy, those which contain each one equivalent of anhydrone salt, weighed in grammes, dissolved in one litre of water—the product of the density by the capillary hight is perceptibly the samo.

ABSORPTION OF WATER BY LEAVES.—The experiments of Cailletet confirm fully the results of Duchatre and others that leaves absorb neither water with which they are wetted nor vapor from surrounding air—as long as there is a full supply by the roots. He shows incontestibly, however, that foliage does absorb liquid water (but not watery vapor) when the root snpply fails.

Of the sixty-four ehemical olements which compose our globe, nineteen have been found in meteorites, and as no single element has been discovered in them which was not previously known on earth, it is supposed that the more distant parts of the universe are similar in composition to our sphere.

MECHANICAL PROGRESS.

A New Motive Power for Ships.

The *Liverpool Albion* reports that recently a number of gentlomen interested in shipping met at Canada Basin to examine a new means of propelling ships, which has been invented by Mr. J. J. Allingham, of Hamilton-road, Everton. Mr. Allingham's idea is to make the waves, acting upon the hnll, propel the ship; and this he proposes to do by a very novel contrivance. Beneath the keel of the vessel he would fix two oblong steel frames, each fitted with two sets of blades to open and shut crosswise. One frame he would secure to the forepart, and the other to the stern. Both the frames would he fixed at an angle. When the vessel rises on the sea, the pressuro of the water upon the frames would of necessity force her forward; and when she sank, the blades, opening, would form the opposite angle, and the outward motion would thus be continued. The apparatus would also have the effect of steadying her. When she rolled over to the right, the blades on the left side of the frame being shut, the frames would tend to bring her back to the perpendicular; and, when she rolled to the left, the closing of the blades on the right side would have a similar effect. The angles of the frame would have to be increased or lessened, according to the state of the weather. To stop the vessel it would he simply necessary to close the blades in the frames. The action of the appliance depends entirely upon the motion of the waves; but at sea it is rarely the case that there is not a sufficient motion in the water to raise a vessel several feet.

The inventor believes that the apparatus would be a sufficient propelling power for ships not required to travel at a great speed; but would supply ships with a limited quantity of rigging as auxiliary power, and to provide against accident. The working of the invention was shown upon a model ship seven feet in length. The little vessel held its way against the tide, and, even in comparatively calm water, traveling at considerable speed. The opinion of the spectators seemed to he that the invention is in a somewhat crude state at present; hut that it is founded upon a sound principle which, skillfully applied, would be of great value to the mercantile marine.

MECHANICAL WOOD CARVING.—H. A. Lanteigne, of Paris, has invented a machine for ornamenting wood surfaces, which is very highly spoken of. The wood is passed between a bed-plate and a matrix cylinder, on the surface of which the desired design has been cut so that it is pressed into the wood. The ease of thus cheaply producing ornamental woodwork is appsrent, and the invention has been pronounced by some the richest industrial product of the last ten years.

MONZONITE, A NEW MINERAL.—Von Kobell describes a new mineral, called Monzonite, as occurring in Monte Monzoni, in the Fassa Valley.

Soldering Fluids.

There are several soldering fluids in use. Among these is one for

Soldering Iron and Steel,

Which we quote as follows: "Take a solution of phosphoric acid in alcohol at 80 per cent. Tho parts to ho soldered are moistened with this solution either by dipping in or with a hair brush. Another solution is that of the double chloride of zinc and ammonium, to be made hy diseolviug equal parts by weight of zinc and sal ammoniac in strong hydrochloric acid, and evaporating to dryness at a gentle heat. The saline residue is afterward dissolved in water, so as to make a strong solution. It is ohvious that after soldering, the metal has to be carefully cleaned so as to remove any excess of adhering soldering salt solution, because both the liquids here alluded to would, if left on the iron or steel, cause it to rust.

Alloy Suited for Soldering Steel and Iron to Brass.

Take 3 parts of tin, 39¼ of copper, and 7¼ of zinc. It is stated, by this alloy in molten state, steel and iron, as well as these and brass, can be so joined togother as to prevent any breakage.

INTERESTING TO IRON BUILDERS.—A discovery has recently been made in France, highly interesting for iron-builders, and relative to the conservation of the iron beams used in hydraulic works. It consists in the application of a chemical process operated at once, without any particular tools, and at a trifling cost. Supposing two beams have to he joined together, holes have to be bored and next filled with some zinc-filling mixed with any fatty material, then the peg or screw is introduced in the ordinary way. A galvanization ie thus slowly produced, absolutely the same as when iron is dipped into molten zinc. This process can even he applied to timher. Experiments have been made, and declared perfectly conclusive.

In the Spanish colonies, they use, instead of hydraulic cement, the ordinary hricks baked to a high temperature and ground to a state of fine dust. They are mixed with ordinary lime and sand. This article is sold per barrel, at the same price as cement. The proportious, generally employed are one part of brick dust one of lime, two of sand, mixed dry and moistened afterwards with water.

AN IMMENSE BRIDGE STRUCTURE.—Our country has some vast structures comparatively unknown. The Tensas and Mobile bridge, or bridges, on the Mobile and Montgomery Railroad, in Alabama, extends from Tensas station, on the Mobile and Montgomery road, to the city of Mobile, a distance of fiftcen miles, crossing both the Mobile and Tensas rivers, and including ten draws, one for each of the navigable channels into which the rivers are divided. The bridge itself is constructed of wood, but its pillars or supporters are iron cylinders, which rest on a solid surface of wooden piles, driven down evenly with the hottom of the stream and the mud of the intervening morasses. It has been three years in the course of construction, at a cost of about $1,500,000; and now that it has been sucessfully completed, it is perhaps the longest structure on the globe.

REPORT ON THE PROGRESS OF THE IRON INTERESTS IN EUROPE.—By the last quarterly report on the progress of the iron interest in Europe, it appears that the production of pig iron in the Prussian Provinces as given for 1869, was 1,151,945 tone; 1870, 1,137,448 tons. According to this report the iron mines in the north of Spain are now attracting much attention because of the English demand for rich and pure ores for the manufacture of iron, suitable for the conversion into Bessemer steel. These oree are principally hydrous, red, brown and yellow hemetites, and spathic carbonates, which occur in the cretaceous formation in the form of great lodes often 100 to 300 feet wide traversing the formation more or less coincident with the strata. The rich magnetites of the south of Spain (between Gihraltar and Malaga) are also attracting the attention of capitalists.

PUTTING TIRES ON WAGON WHEELS.—A mechanic gives the following method of so putting tires on wagon wheels, that they will not get loose and require resetting: I use a long cast-iron pan or dish made for the purpose; linseed oil is brought to a boiling heat, the wheel is placed on a stick over the dish, so as to hang in the oil, each felloe an hour. The timber should be dry, as green timber will not take the oil.

MOVING RAILROAD TRAINS BY SAIL.—The Peteler Portable Railroad track has been laid down by the party engaged in constructing Matagora Light-house, and transportation has been greatly facilitated by using a sail on the cars. As great a speed as a mile in 2¾ minutes has thus been attained, and it was found that the cars would sail almost as close to the wind as a hoat.

ARCHITECTURAL ERROR.—A modern architect says we should no longer lath and plaster our houses; other modes of finish are more desirable. By the present system we build one house for ourselves, and two for the rats. No one can controvert the last assertion.

MINING SHAREHOLDERS' DIRECTORY—Meetings, Assessments and Dividends.

S. F. Stock and Exchange Board.

Thursday, August 1, 1872.

The sales at the Stock Board for the week ending on Thursday 25th ult. were $3,028,000. During the past week, 90 tons of ore were raised from the North Star, and 109 tons reduced, leaving 25 tons on the dumps. The American Flag mine shipped $22,000 on the 26th inst. There is now 1,160 tons of ore ready for the furnaces at the Eureka Consolidated mine. The Phœnix shipped 11 tons of bullion on the 26th ult. The Eureka (Grass Valley) mine turned out 550 ounces of gold last week. The Sierra Nevada produced during the same period, 420 tons of ore. The Crown Point mine yielded 2,300 tons last week valued at $59,000 and the August dividend is expected to be lower than last month. The snm of $35,400 was sent down from the Rsymond & Ely mine on the 29th ult. and $44,500 on the 31st making a total of $346,705 for the month. The mill and mines are reported in good condition. The Chollar-Potosi turned out last week 950 tons, assaying $40.40 per ton; the Savage 1,230 tons, assaying $25.08 per ton, and the Hale & Norcross 700 tons of ore. The sum of $10,300 in bullion was shipped from the Pioche mine on the 30th ult. The Mahogany mine shipped $7,900 on the 26th ult. Dividends this month amount to $852,000; the dividends in same month last year were $363,300 showing an increase of $488,700.

The principal excitement among stock circles this week is the proposition of some of the stockholders in the Gould and Cnrry mine to oust the present trustess and place others in their stead, which under the law passed at the last session of the Legislature can be done under certain conditions. The first practical application of this law was in the case of the trustees of the Savage mine some five months since. The mine has returned no profit to the stockholders for the past two years and has sent down no bullion to stockholders since October 1871. The Diamond mine company, incorporated as the San Francisco and New York Mining and Commercial Co. have put 15,000 shares of their 100,000 shares on the market at $40 per share. Considerable excitement exists in stock circles over this diamond discovery, the particulars of which will be found in another column.

A letter from the Crown Point states that the indications are of an increased breadth of ore in the 1,300 foot level over that in the 1,200 foot level, which is 120 feet wide. Assays in the bottom of the winze average $269.40 in silver and $200.80 in gold—total $570.20 per ton.

The ore sent to the mills duriug the week ending July 26th inst. did not run as high as nsnal being from the 1,100 foot level, work below the 1,200 foot level having been interrupted by the cave. The water is receding slowly bnt surely, and the pump works well. It is now all out of the 1,300 foot. level, and a few days work will clear the winze. The mine will fnlly recover its productious of ore. A dispatch from the Pioche dated the 30th ult. states north winze down 21 feet, in ore two feet wide assaying $251. Sonth winze down 36½ fcet, ore 2¼ feet thick, assays $185. The new 160 foot drift is in 26 feet. The Belcher has not been able to get out the usual quantity of ore because the Yellow Jacket company have beeu compelled to nse their cages in hoisting water. The capital stock of this mine has been increased from $1,040,000 to $10,400,000 during the week which accounts for apparent discrepancy in our list of sales.

On Friday stocks were moderately firm. From Thursday morning's sales Belcher advanced $20; Gould & Curry $10; Alpha, Bacon and Ophir each $5; Crown Point $4; Yellow Jacket $5; Confidence, Exchequer, Eclipse, Empire Mill, Imperial, Sierra Nevada and Trench, each $1. Kentuck and Savage each declined $5; Hale & Norcross $4; Consolidated Virginia and Segregated Belcher each $2.

On Saturday prices were weak and irregular. From highest prices of the previous morning-Belcher advanced $10, Exchequer and Ophir each $3, Segregated Belcher $2, Enreka Consolidated, Pioche and Sierra Nevada each $1. Savage declined $10, Chollar-Potosi $2, Gould & Curry $8, Hale & Norcross and Yellow Jacket each $5, Caledonia and Crown Point each $4, Jnstice $2, Ida Ellmore $1.50, Consolidated Virginia and Overman each $1. No particnlar variation in other kinds.

Monday the market opened at lower prices. From highest rates on Saturday Caledonia declined $2; Chollar-Potosi $4; Consolidated Virginia $4; Crown Point $10; Exchequer $1; Gould & Curry $7; Hale & Norcross $8; Imperial $1; Overman $4; Savage $10; Segregated Belcher $1; Sierra Nevada $1, and Yellow Jacket $3. Belcher sold on the new basis on Monday at $110 to $108, equal to $1,100@ $1,080 for old stock. There are now 100 shares to the foot.

Mining stocks on Tuesday were in moderate demand and prices irregular. From the rates paid Monday morning, Segregated Belcher advanced $9; Caledonia $3; Belcher, Hale & Norcross and Overman each $2, and Central $1. Gould & Curry frrther declined $10, Ophir $4, Yellow Jacket $2, Chollar-Potosi, Crown Point and Sierra Nevada each $1.

On Wednesday stocks were much livelier, Belcher being the feature, and continuing to sdvance, compared with highest prices of day previous; Belcher advanced $8, Caledonia, Chollar-Potosi, Overmau, Segregated Belcher and Yellow Jacket each $2; Consolidated Virginia $4; Gould & Curry $12; Hale & Norcross $6; Savage $7; Ophir was $2 lower. Stocks were in light demand to-day at weak prices. From yesterday morning's sales, Segregated Belcher declined $7; Ophir $3; Alpha and Consolidated Virginia $2; Caledonia, Chollar-Potosi Exchequer and Overman each $1. Belcher and Hale & Norcross were each $3 higher than yesterday morning.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE COUNTY.

Exchequer.—Alpine *Chronicle*, July 20: Two tons of ruby silver ore, low grade, was last week worked at the Schenectady by wet crushing and raw amalgamation with salt and bluestone. Seventy-four per cent. of its assay value was obtained in bullion .798 fine.

Leviathan.—A body of ore of the richest quality of the oxidized class has recently been opened out in No. 7 drift. An average sample upon assay showed 44 per cent. copper.

Globe.—Pumping was resumed on Tuesday, and on Monday drifting will again commence.

AMADOR COUNTY.

Bunker Hill.—Amador *Ledger*, July 27: The mine is looking well, and as work progresses gives most flattering assurance of future valne.

Original Amador.—Several days ago the 40 stamps were set in motion, and are pounding away on the large accumulation of valuable rock taken from the mine during the construction of the mill.

BUTTE COUNTY.

The Mines.—Chico *Enterprise*, July 26: The Alder Creek claims pay from $3 to $4 per day to the hand, with rocker. The Negro claims on Alder Creek are laying a flume preparatory to cleaning up. The ground prospects well. Gamblers' Gnlch quartz claims are paying from $1.50 to $2.50 per day to the hand. Georgia Slide, on Gamblers' Gulch, is paying about the same by ground sluicing. The Bull Creek mines have paid very well the past season.

Goon Prospects.—Parties sinking a well at Redding fouud coarse gold several feet below the surface, prospectiug 9 cents to the pan.

Cherokee Mines.—Marysville *Appeal*, July 23d: The Spring Valley Co. cleaned up about $50,000 last week. This makes about $200,000 taken out by this Co. during the season. The Cherokee Co. has cleaned up $82,000 during the season. The Hendricks Co., at Morris Ravine, have plenty of water, and are supposed to be doing well.

CALAVERAS COUNTY.

Upper Country.—Calaveras *Chronicle*, July 27: The Wolverine folks are surprised by the richness of the ore from the 200-ft. south level. The streak referred to last week contains rock *now*, which will pay handsomely for crushing at the rate of $3,000 per ton.

The 350-ft. north level in the Petticoat is in barren vein matter, the level having passed through the south chimney. Sinking in the main shaft. Some 75 tons of ore are at the mill, which is being overhauled.

The re-opening of the Sanderson was delayed on account of the scarcity of experienced underground miners. The vein is ready for active operations. The vein in the north level prospects better than expected; sinking commenced yesterday.

Gamble & Co., west of Independence, met a fine body of ore in the south level containing a valuable streak of solid sulphurets. A new tunnel is being started one hundred feet below the old one.

The Grasshopper at Mosquito has resumed sinking.

Preparatory work is going on at the Lonc Star, on the North Fork, with the view of reopening this mine.

At 40 ft. water was met in the main shaft of the French Lead, near West Point.

The Blazing Star shaft continues to yield ore worth $100 per ton.

Work has been commenced on the Josephine.

Gwin Mine.—Thursday we saw the product of 16 stamps during a run of 13 days. The amonnt was several thousand dollars. The rock crnshed was taken from the central shaft at 120 ft. The sinking of this shaft has developed an immense body of rich ore, extending from the surface down. A coutract for sinking it 100 ft. has been let. A wide ledge of first grade ore also shows itself in the bottom of the 500-ft. level in the south shaft, and the work of sinking 100 ft. deeper will be commenced next Monday.

Silver Mining.—Work has been recommenced npon the Heckerdon at Blue Mountain. The President of the Co. has purchased the Water Co's mill in Chili Gulch, which will

be placed npon the mine aa aoon as practicable.

Machinery.—A water-power arastra ia being put on the Horse-thief mine near Jesus Maria.

EL DORADO COUNTY.

Nearly Completen.—Placerville *Democrat*, July 27: The new 10-stamp mill on tbe Cedarburg, near Greenwood, will probably commencee crushing next week. The Co. are down about 60 ft. on the ledge, at which point it is immensely rich. Very rich ore has been discovered in the northern extension of this mine.

NAPA COUNTY.

Reddington.—Napa *Register*, July 27: We note the arrival of 66 flasks of quicksilver from the Reddington mine.

Quicksilver.—The numerous mines are all reported to be in a promising condition. The Valley mine has yielded 13 flasks witbin a month, and the Washington, with a force of 5 men, has yielded 28 flaske and a net profit of $1,000 within the same period. The Phœnix has 4,000 tone of ore on hand, and has resumed the work of reduction after a stoppage of 4 weeks for repair of its works. The Oakville is reported in snceessfnl operation. The Whitten lately sold for $45,000, is awaiting the erection of reduction works.

PLACER COUNTY.

Enterprise.—Auburn *Stars and Stripes*, July 25: At the Weske claims, Mr. Anderson has taken a contract to run a 4,000 ft. tunnel tbat will tap the main ridge portion of the claims.

Better.—The Auburn claim, Rock ereek, is improving in the character and richness of rock and size of ledge as tho shaft deseends. The shaft is down 130 ft., with a solid ledge 3¼ ft. in thickness and beautiful bluish rock, heavily loaded with galena and other sulphnrets, and making a good showing of free gold.

PLUMAS COUNTY.

Hunoarian.—Quincy *National*, July 20. Thesc claims are paying splendidly.

SAN DIEGO COUNTY.

Bullion.—San Diego *Union*, July 18: W. F. & Co. shipped by the *Pacific* gold bullion from the Julian and Banner mines valued at $2,807.

Discovery.—W. P. Miller came in on Sunday with some fine specimens from a lead discovered 12 miles thie side of Fort Yuma. He struck the lead hy sinking a shaft abont 30 ft. deep. The quartz contains a good ehowing of free gold.

The Mines.—The Defrees mill is running regularly on Owens rock, and that mine looks better than ever as the boye go down.

In the old tnuncl of the Good Hope the Swain hoys have just struck a splendid body of ore, very rich, and showing much free gold.

The Bush hoys have been taking out eome very rich rock from the Mahel ledge.

In the Helvetia shaft better rock tban ever hae been struck at 165 ft. The ledge is exceedingly well defined and improvee ae tbey go down.

Rock has been taken from the shaft of the Segregated San Diego, 100 ft. deep, richer than any taken out during the last two years.

In the Cañon the Antelope Co. are getting out splendid ore, and the mill will soon start up.

The Golden Chariot boys are at work, getting out ore of the usual richnese. The Whitney mill will soon begin on 100 tone of it, which will yield from $30,000 to $40,000.

SIERRA COUNTY.

Nuoget.—Downieville *Messenger*, July 20: A nugget weighing 5 ounoes was recently found in Hungrymoutb ravine.

Discovery.—A man named Crawford hae etruck very rich diggings a few miles ahove Poker Flat.

TULARE COUNTY.

Coal and Cinnabar.—Visalia *Delta*, June 25: Botsford and Thomas, returned last week from a prospecting expedition on the eastern slope of the Coast range. They brought with them samples of a bed of coal of great extent, and good quality; also specimens of cinnabar very rich, which will pay largely, if the quicksilver can be separated by mechanical meane.

TUOLUMNE COUNTY.

La Grange Ditch.—Sonora *Democrat*, July 27: The water is running through from its head at Indian Bar to its terminus at La Grange, to tho capacity of 800 inches.

Luce.—Sonora *Independent*, July 27: The Tulloch Quartz mine, at the head of Bear Creek has recently struck rich paying rock.

Nevada.

ELKO COUNTY.

Pensylvania Coal Mine.—Elko *Independent*, July 27: Work is being systematically prosecnted. At 150 ft. the first layer of coal wae struck The coal is of excellent quality. A tunnel will be run to the eastward from tbis lovel, and at the same time work will he continued in the shaft.

EUREKA DISTRICT.

Lanner Cons.—Eureka *Sentinel*, July 20: On the Banner a tunnel has just been started and is in about 20 ft. showing a fine body of rich ore the whole length.

The San José shaft is down 94 ft. and a drift has been run parallel with the ledge 10 ft. The ledge is six ft. wide.

On the New Years claim two shafts have been put down on the ledge, which is about 3½ ft. wide carrying extraordinarily high grade milling ore.

The Charlestown has a shaft 35 ft. deep, showing 4 ft. of ore. The ledge hae steadily increased in width from the surface to the present depth.

The Dannbe is being opened by a tunnel, which has penetrated the mountain over 25 ft. The ledge is 5 ft. wide.

The Republic has two shafts, besides several ents and drifts, which discloee a magnificent body of ore.

Louisville Cons is developing satisfactorily. Some exeellent ore is being raised whicb assaye on an average about $200 per ton.

Ruby Hill Tunnel.—Tbe tunnel is in over 100 ft. Another shift of men are to be immediately employed and the work driven with all possible dispatch.

Good Ore.—Supt. Copp, of the Magnolia Co. lately delivered at the Phenix furnace a lot of abont 40 tons of ore from the Newport which yielded at tha rato of $102 per ton.

The New Furnace of the Silver West Con. will soon be in readiness to start np.

Phenix.—The reduetion works aro running satisfuctorily, and turning out clear profit abont $18,000 worth of bullion daily.

Eureka Con.—This Co. is erecting two sets of hoisiting works on Ruby Hill. The mine never looked eo well, and two of the furnaces are in full blast.

New Mines.—In the Pittsburg tunnel of the Pittshurg Co. a body of antimonial silver was recently developed, which assays as high as $1,800 per ton. One of the mines of tbe Co., the Rose Murdock, erops out boldly for over 2,000 ft.—the ore assaying on a general average ahont $87 per ton. The Lide Horner assays $74 per ton in silver.

ELY DIST.

Bullion.—Ely *Record*, July 21: During the past week W. F. & Co. have shippsd bullion valued at $93,661.14.

Pioche.—The new strike on the 110-ft. level is not looking eo well ae at the time of our last review. Pulp assaye from the battery during the past week show an average of $200 per ton.

Sterling.—Sinking of shaft progressee steadily, good headway being made. Shows well in bottom, and carries mnch mineral.

Harper.—Have cut tho ledge in weet drift. It shows 2 ft. in width ae far as opened up.

Page & Panaca.—Shaft down 306 ft., and continues. Tbe hoisting machine is in poeition, and ready to start up as soon as the steel cahle arrives.

American Flag.—Mine continues looking exceedingly well in all parte.

Newark.—Everything will be in readiness for the erection of the hoisting worke as soon as the machinery arrivee.

Ivanhoe.—Work is progressing finely, the old shaft being down 200 ft., and the new one 100 ft.

Peavine.—Resumed work on Friday morning.

Condon.—Work on bottom drift continues, and it is in about 10 ft., witb no foot wall yet in sight.

Pacific Tunnel.—From present appearauces it ie expected another ledge will be cnt in a short distance.

Chief of the Hill.—Tracing drift is in 30 ft. Good headway is being made.

Aztec.—Shaft down 60 ft., following vein the entire distance. Ore assaye for tbe paet week average $88 per ton.

Chapman.—Sinking of the shaft is progreseing favorably.

Alps.—Shaft down 163 ft., and sinking progressing ae usual.

Mocking Bird.—Ledge bas a bold outcrop showing it to be full five feet wide. Shaft down some 65 ft., following the hanging wall of the vein, wbich pitches into the hill to the south at an angle of about 70 deg. Vein, 4 ft. wide on an average; walls regular, and casing ehowing it to be a true fisenre vein. The entire vein matter carries mineral, much of it very higb grade.

San Jose Con.—The Justice shaft ie einking on the incline. Present depth of incline 115 ft.; bottom of incline in good milling ore. Will soon commence saving ore for milling.

Huhn & Hunt.—Running the main drift into the hill, and making good progreee. Indicatione in the face of the drift are very favorable.

Amazon.—A vertical shaft hae been eunk 85 ft., from whence a drift has been run north 50 ft., tapping the ledge, which ehows 2 ft. of low grade ore.

Burtol Dist.—Mr. Ordway, manger of the National, ie erecting a furnace 5 miles north of the mine. They have about 500 tons of galena ore on the dump, that ie estimated to net $100 per ton, and the Hercnles hae at leaet 2,000 tone of the same clase ore.

Grey Eagle.—The shaft is down 45 ft., and a conetant improvement ie noticeable in the ledge as sunk npon. Ore from tbe bottom shows an average assay of $167.25 per ton.

HUMBOLDT.

Relief Dist.—Unionville *Silver State*, July 27: In the Central Pacific the ledge is 8 ft. wide, 3 ft. of which is firet-clase or sbipping ore, and the balance average milling ore. A force of 20 men ie employed, and the nnmber will probably be increaeed. The mill commenced crushing on Saturday.

On the West Point, the working force will be increased immediately.

Work will be resumed ehortly on the Alta and Greenstone ledgee.

From the Silver Queen, some very rich silver ore is being extracted.

Occidental.—The Occidental copper mine, San Jacinto Dist., is turning ont rich. The shaft shows a 3 ft. of solid copper ore of a high grade.

Pride of the Mt.—Humboldt *Register*, July 27. Work continues on the Pride of the Mountain. The Co. have 13 men at work, running exploring drifts and tunnels.

REESE RIVER.

Whitlatch Union.—Reese River *Reveille*, July 20: Not looking aa well for eome months past. Breasting continues and a considerable amount of ore going to the mill.

Saratoga.—Work being vigorously prosecuted; mine looks encouragingly well.

Lone Star.—A large amount of very high grade ore has been taken out during the last 6 months. Mine being put in condition to open eome new breasts; some good ore being raised.

Star of Nevada.—Main tunnel progressing into the hill.

Freehold.—New hoisting works operate satisfactorily; a good body of average ore in sight.

Florida.—Prospecting continues in various parts of the mine; hoisting some ore daily.

Semanthe.—Going down on the incline.

Morgan & Muncey.—Looks well, and paying well.

Grove Tunnel.—Some little improvement.

Isabella.—Holds out splendily; lessees doing well.

Saybrook.—The 150-ft. level being driven ahead; some little quartz appears; indications good.

Ironclad.—Nothing doing at present.

Lane & Fuller (Pacific Co.)—Large quantities of ore coming out; large force of men employed.

Manhattan Mills.—This mill is working satisfactorily to both agent and owners, and turning ont immense qnantities of bullion.

Patriot.—Taking out ore steadily.

San Antonio.—The Liberty and Potomac are being constantly worked.

Jefferson Canon.—Johnson & Co., whose first working wae over $900 per ton, bave several tone more in sigbt tbat they are assured will nealy double those figures. About 30 men are employed in the dist.

Overman.—Tbe 1,100-ft. station is fully opened for the drift to the ledge at that level. The drift west at the 1,000-ft. level is 470 ft. and the face is in ledge matter.

Jacob Little.—The ledge in the main tunnel is over 12 ft. in width and showe a fine body of excellent pay ore. The vein is well defined and of the regular Comstock silver ore.

Kentuck.—Daily yield 50 tons from the old fifth and sixth levels. The ore breasts promise to hold out for several months yet. A drift is commenced at the 400-ft. level. The 1,300-ft. level continues full of water.

Woonville.—The daily yield will he considerably increasd next week, in order to supply an additional mill. Tbe ore is paying splendidly.

Sierra Nevada.—Daily yield 45 tons, from the lower mine. A great deal of energetic prospecting is being done.

Sutro Tunnel.—Total length 2,978 ft. The rock is very hard in the face of the tunnel but blasts well. Tbe various air shafts are progressing well.

Buckeye.—Incline being sunk deeper, with good progress. The ore breasts are yielding well and looking excellent.

Knickerbocker.—The 400-ft. station timbers have been put in and sinking the main shaft deeper is actively resumed.

Baltimore.—New shaft down 178 ft.; considerable water is coming in, yet not enough to obstruct operatione.

Daney.—The drift at the 500-ft. level shows improvement.

Caledonia.—The 400-ft. level drift is progressing well and shows excellent indications.

Succor.—No new developments in the mine. New shaft and mill idle.

WASHOE.

Bullion.—Reno *Crescent*, July 20: Amount that passed through Reno for the week ending Friday, July 19th, wae 14,097 lbs.

Local Summary.—Gold Hill *News*, July 17: Belcher.—The ore breasts are all looking splendidly. The main incline is down 497 ft. below the 850-ft. level, and has 34 ft. further to go to connect with the weet drift from the 1,000-ft. level. A drift or gangway east has been run 100 ft. from the incline, which has cut into the ledge and shows very favorable indications for finding ore. The eouth drift at thie level ie being run to connect with this east drift. The yield of the mine for the past quarter wae $1,203,050.

Crown Point.—Daily yield eame as before the cave. The main drift at the 1,200-ft. level, has been cleared of the debris. Tbe cave extende to the 1,100-ft. level, both timbers and ore having settled in placee from that point and the drift closed np. No great damage done to the mine.

Utah.—Operations are confined exclusively to einking the new ehaft on the east side of the vein.

Savage.—Daily yield 180 tons worth $28 per ton. The incline is down 100 ft. bslow the 1,500-ft. level, and making but moderate progress. Tbe ore body struck last week in the sonth cross-cnt of the 1,500-ft. level is not only holding out as the work of prospecting progresses, but ie steadily increasing in assay value.

Silver Hill.—Engaged in sinking and enlarging the shaft. The drift on the 125-ft level has crossed the east ledge. The average of the assaye at thie depth, for a width of 17 ft. is $26.

Hale & Norcross.—Daily yield about 80 tons from npper levele. Prospecting ie carried on in the 1,500 (lowest) level. The main incline is advancing downwards with regularity.

Cone. Virginia.—On the 500-ft. level crossdrifts have been started to the east and west, and a cross-cut is in progress from the end of the drift leading from the 1,116-ft. level of the Gonld and Curry.

Justice.—The water being drained from the main shaft the drift for the ledge at the 400-ft. level is reopened and the ledge will he ent and investigated in about 2 weeks. The ore found in Waller's Defeat ground is of excellent character and pays well.

WHITE PINE.

Ruby Hill—Columbus.—Schell Creek *Prospect*, July 20: The tunnel is in 90 ft., have struck the ledge under the eroppings with a very steep pitch. Tbe ledge matter assayed from $75 to $100. They are in a body of quartz carrying ruby and horn silver.

Tambien.—Looking well and working several men.

Savage.—This mine continnes with fine prospects; will start with a force of men next week.

Ajax.—The mine is looking well and prospects better than ever.

Gallagher.—Work has progressed on this rich claim during the week. Ore assays have gone as higb as $248.

Henry Mine.—Improves steadily as work progresses. Assays show about 70 per cent. lead, and $60 to the ton of silver.

Schell Creek Mine.—The eroppings are nearly 200 ft. in width mixed with limestone and quartzite. About 8 tons of good milling ore taken out. The tunnel is in abont 130 ft. They struck quartzite at a distance of 125 ft. which shows indications of silver. They are working three shifts of men and pushing the work ahead vigoronsly. They expect to strike the ledge within 20 ft.

Silver Canon Dist.—We were shown some rich specimens of ore from tbe Clayton. There are 5 men to work and the mine is improving daily. There is a quantity of ore on the dump wbich will mill $500 per ton.

Treasure Hill Mines.—Treasure.—White Pine *News*, July 20: The open cut has been connected with the lower tunnel, showing good ore, wbich is being shipped to the Big Smoky mill. Tbe Wheeler tunnel ie in about 300 ft. with good indications of striking ore. Assays from the spar eeams average $50. Tbe lower tunuel is furnishing a rich and large lot of ore. Working 65 men.

Beecher Con. M. ann M. Co.—The south end is being worked with 45 men. The Ward Beecher (proper) is taking out about 30 tons of good ore daily and shipping to mill.

Silver Wave.—Will commence shipping rock to the Swansea mill next week. A fine body of ore has been struck in the Boswell works.

Eberhardt and Aurora Co's Mines.—The largest breast of ore in the De Pass chamber is increasing in width. The deposit ie of great richness, and promises continuance.

Silver Plate.—Four new openings are being made. Very little change in the appearance of the ore.

Pennsylvania.—A decided improvement in vein matter since our last report.

San Juan del Rio.—The contractors are down 65 ft., on a body of fine ore. The Co. contemplate building a mill ae soon ae tbe mine is thoroughly opened.

Noonday.—Taking out good ore from tbe surface worke.

Sunbeam.—Working 5 men. A wagon road has been built to the mine. Mine looking splendid, and there is a good lot of ore on the dumps, which will average $100 per ton.

Pogonip and Othello.—Conciderable work is being done upon these minee. The ore-body is improving in extent, with a fair prospect of the quality increasing in value.

Mammoth.—Looking well, and a large force of men employed. Large body of good milling ore in sight.

South Icenebo.—Jim Logan is having 70 tone of fine ore worked at the Big Smoky.

East Sheboygan.—Ore of a high grade hae been broken down from the ore chamber.

Copper Glance.—The north shaft and west drift is being pushed ahead by the contractors. Ore of a very good grade in each.

Outside Dist.—Schell Creek.—Many of the principal mines are being opened, and others making preparations for vigorous working.

Troy.—The mines are looking well, the ore being of a good quality.

Mills—International.—Running 60 etamps on ore from the Eberhardt & Aurora Co.'s mines.

Manhattan.—Running steadily on ore from the Beecher Con. M. & M. Co.'s mines.

Big Smoky.—The full number of stamps ie running on O. H. Treaeure ore.

Swansea.—Shut down for repairs; bnt will probably etart on Monday on Silver Wave ore.

Arizona.

Mines and Mining.—Prescott *Miner*, July 13: The Vulture Co. are running 20 stampe. At Weaver, a party of miners are making considerable money by crushing free gold ore in an arastra. Fred Henry is preparing to sink on a lode there.

Colorado.

Ætna.—Colorado *Miner*, July 11: Marsh & Gilchrest are working the Ætna lode, on the west slope of Griffith mountain. The crevice is wide, and carries an ore vein of from 8 inchee to 2 ft. in width. The ore is galena, zinc blende, and a grayish white quartz; in places the mineral is found aggregated in bunchee, often very rich and somewbat decomposed. A lot of one-half a ton was sent to the Swansea works, a few daye since, and a returu of $415 wae realized. A continnoue ore vein has been found wherever any work has been done.

The Economic Value of Certain Australian Forest Trees, and their Cultivation in California.

[Delivered before the Academy of Sciences by ROBERT E. C. STEARNS.]

Australian foreet trees propagated from the seed, with perhaps a few excepti one, thrive remarkahly in California; the climate and eoil appear to he nearly or quite ae favorahle to the growth of these exotic as of the native forest forms.

In many of the priucipal towns in this State, especially in and around San Francisco, in the neighhoring city of Oakland and adjoining towns on the easterly side of San Francisco bay, fine specimens of many of the Australian forest species are exceedingly numerous. The most popular of these helonging to the genera *Acacia* and *Eucalyptus*, have been planted for ornamental and shade purposes; the light feathery fern-like foliage of some of the Acacias, tbeir gracefulness, heauty and color combined with rapid growth, present so many advantages as to fairly entitle them to popular esteem. Of the Acacias recommended by Dr. Mueller on account of their economic value, I am not aware of any heing cultivated in this State for that ohject. *A. decurrens* (A. mollissima) also *A. lopantha* and some other epecies, are frequent, and highly prized for ornamental purposes; from twenty to thirty species are euumerated in the catalogues of the principal nurseries.

The many valuahle properties of the species mentioned, combined with rapidity of growth, would warrant cultivatiou on an extensive acale, which if judiciously conducted would he highly advantageous to the State and yield a handsome return upon the capital invested. Mueller says that the wood of *A. decurrens*, properly known as the "Black Wattle or Silver Wattle," can he used for staves, but its chief use would he to afford the first shelter, in treelees localities, for raising forests. Ite hark rich in tannin, and its gum not dissimilar to Gum Arabic, render this tree also important.

A. Homalophylla,

Has a "dark hrown wood, is much sought for tanner's work on account of its eolidity and fragrance; perhaps its most extensive use is in the manufacture of tobacco pipes."

A. melanoxylon "ie most valnahle for furniture, railway carriages, boat building, casks, hilliard tahles, pianofortes (the sound-hoards and actions) and numerous other purposes. The fine-grained wood is cut into veneers. It takes a fine polish and is considered equal to the hest walnut." Under favorahle circumstancee it attains "a hight of eighty feet with a stem several feet in diameter." This species requires a deeper and moieter soil than *A. decurrens* and *A. lophantha*, which are especially recommended for their ability to resiet drought, and therefore particularly applicable to treeless and sterile areas in the southern part of California, and the adjoining country, where the temperature does not decline below 10°.

The peculiar yellow displayed in the China silks and other articles, is obtained from the yellow flowers of a species of Acacia, and of an exceedingly permanent character.

The Acacias are easily propagated from seed, as I have (with some species) practically tested; and it is not unlikely that the flowers of most of the species, which are yellow, might he equally as valuable for the dyer, as the variety cultivated or nsed by the Chinese.

Of the *Eucalypti*, *E. globulus* is very common in California, and easily cultivated; it is the Blue Gum of Victoria and Tasmania. "Tbis tree is of extremely rapid growth and attains a hight of 400 feet, furnishing a first-class wood; shiphuilders get keels of this timber 120 feet long; besides thie they use it extensively for planking and many other parts of the ehip, and it is considered to he generally superior to American Rock Elm. A test of strength has heen made between some Blue Gum, English Oak and Indian Teak. The Blue Gum carried fourteen pounds weight more than the Oak, and seventeen pounds and four ounces more than Teak, upon the square inch. Blue Gum wood, hesides for ship building, is very extensively used by carpenters for all kinds of outdoor work, also for fence rails, railway sleepers —lasting ahout nine years—for shafts and spokes of drays, and a variety of other purposea.

Rapidity of Growth.

Of the rapid growth of this species of Eucalyptus and the facility with which it is propogated, most people in California who have had any experience with it are familiar; but as perhaps few persons who have specimens of it growing upon their grounds or in their yards are aware of its value otherwise than for ornamental purposes, I have deemed it a matter of interest as well as of importance to quote from Dr. Mueller's valuahle paper. Having propogated the Blue Gum from the seed and raised may specimens under not particularly favorahle circumstances, I can indoree the remarks of the author from whom I have quoted. An instance of rapid growth immediately under my observation, is that of a specimen purchased by me of a nurseryman, which at the time of planting (Jan. 5, 1871) measured from the ground level to the extreme tip six and one half feet, and in ahout eleven months (Dec. 8, 1871) had reached a hight of a trifle over fifteen feet; the diameter of the stalk when set out was half an inch, and at the final measurement one and three quarters inches. I am prepared to hear of inetances far exceeding my figuree, hut it ehould he horne in mind that we had very little rain after this tree was planted, and furthermore that the locality was upon nearly the highest ground in Petaluma. This tree was occasionally, but only moderately watered during a part of the time. Other trees of thie speciee planted at the samo time, also made a remarkable growth; apecimens raised by me from the seed, whose growth I bave uoted, ehow a gain of ten and a half inches in twenty-one days, or half an inch per diem.

Tbe development of the lateral branchee is as surprising as ite perpendicnlar growth.

George C. Potter, Esq., of Oakland, informe me that specimens upon hie grounde nine years old, show a diameter of twelve inchea.

Of the large plantation of Eucalyptus of the Blue and Red species made a few years ago hy Mr. J. T. Stratton, of Alameda, I hear indirectly that the trees have done well. I hope at a future meeting to be ahle to learn from Mr. Stratton, and inform the Academy more definitely of the euccees thus far, and prospects of this highly commendahle and important enterprise. The many

Valuable Properties.

Of the Eucalyptus attracted the attention of the French Goverment several years ago. A specimen in the Jardin d'Acclimation at Algiers, excited the admiration of the Emperor while on a visit to that place, and upon measuring the tree it was found, according to the Paris *Moniteur*, to have made "a hight of 30 feet and a diameter of six inches in two years." Since that time it has heen extensively cultivated in Algiers, and of late it has been stated that it "is making rapid progress in the south of France, Spain and Corsica, especially on account of its alleged virtues as a remedy for fever. It furnishes a peculiar attractive matter, or alkaloid, called Eucalyptine, said hy some to be as excellent a remedy against fever as quinine.

In Spain its efficacy in cases of intermittent and marsh fevers has gained for it the name of "fever tree." It is a powerful tonic and diffusihle stimulant, performs remarkahle cures in cases of chronic catarrh and dyspepsia, is an excellent antiseptic application for wounds, and tans the skins of dead animals, giving the fragrance of Russia leather. The tree prefers a marshy soil in which it grows to a great hight very rapidly. It driee the earth under it by evaporation from its leaves, and sheltere it from the sun, thus preventiug the generation of marsh miasm."

Of the medicinal properties of *E. globulus* we have additional testimony in a recent number of the Practitioner, where Dr. M. C. Maclean relates the results of his experiments on patients in the Hospital Wards at Netley, England. He says in connection with certaiu cases of chest aneurisms and cardiac asthma, "With the exception, perhaps of the subcutaneous injection of morphia, I know no remedy so efficacious in allaying pain, restoriegdyspnœa, calming irritation, and procuring sleep in such cases, as to be compared to *E globulus*. He also refers to the use in Germany of a tiucture made of the leaf, which "has been used successfully in 3ij doses in the treatment of intermittent fevers. It appears that it is not only used medicinally in form of a tincture, but also that cigars are made frome the leaves, and its palliative influence obtained by smoking.

"German physicians, as appears from medical journals, have fouud a tincture of the leaves of the *Eucalyptus globulus*, or Australian gum-tree, to he a remedy for intermittent fever. Dr. Lorimer gave it to fifty-three patients, of whom forty-three were completely cured. In five othera there was a relapse, owing to a failure in the supply of the tincture. In eleven of these cases quinine had heen used without effect, and nine of these were cured by the *Eucalyptus*."

Other species of the Eucalypti, of great value and well worthy of consideration, are recommended by Dr. Mueller.

E. Amygdalina,

Labill, which is sometimes met with 400 feet in hight; one specimen in the Dandenong ranges measured 480 feet, surpassing in altitude the gigantic Sequoias of our own State; the wood of this species ia said to be well adapted for "shingles, rails, housebuildings, for the kelson and planking of ships, and other purposes;" in rapidity of growth it equals the *E. globulus*, hut is not so easily satisfied with any soil.

E. diversicolor, *F. v. Mueller*, a native of S. W. Australia, sometimes reaching 400 feet in hight, with a proportionate growth of stem. The timber is excellent, and young trees are reported as doing well even "in dry, exposed localities in Melbourne." It is regarded by Dr. Mueller as a valuable shade tree for avenues, as it makes a dense growth.

The Eucalyptus citriodora, *Hooker*, a native of Queensland, "combines with the ordinary qualities of many Eucalypts the advantage of yielding from its leaves a rather large supply of volatile oil of excellent lemon-like fragrance."

E. gomphocephala, *Candolle*, grows to a height of "fifty feet, wood close grained, hard and not rending."

Eucalyptus marginata, *Smith*. "The Jarrah or mahogany tree of S. W. Australia, famed for its indestructible wood, which is attacked neither hy Chelura nor Teredo nor Termites, and therefore so much sought for jetties and other structures exposed to seawater, aleo for underground work, and largely exported for railway eleepers. Vessels built of this timber have been enabled to do away with copper-plating. It is a very strong, of a close grain and a slightly oily and resinous nature; it works well, makee a fine finish, and is hy shiphuilders here considered superior to either Oak, Teak, or indeed any other wood." The tree does not grow as rapidly as the Blue Gum in the neighhorhood of Melbourne, but Dr. Mueller expresses the opinion that it would make a rapid growth in a more favorahle locality.

The E. Rostrata.

Schlecht, the Red Gum of Victoria, is a very valuahle speciee for the "extraordinary endurance of the wood underground, and for this reason highly valued for fence-poste, piles and railway sleepers; for the latter it will laet a dozen years, and if well selected much longer. It ia also extensively used by shiphuilders, for mainstem, sternpoet, innerpoat, deadwood, floor timbers, futtocks, transoms, knightheads, hawsepiecee, cant, stern, quarter and fashion timber, bottom planks, hreasthooks and riders, windlass, bowrails, etc. It ehould he ateamed hefore it is worked for planking. Next to the Jarrah, from W. Australia," this is the best wood for resisting the attacks of eeaworms and white ants. This species reaches a hundred feet in hight, which ie also the hight of the next and last of the Eucalypti referred to herein, viz.: E. SIDEROXYLON, *Cunn.*, which produces a wood of great strength and hardness, and desirable for carpentere, shiphuilders, and wagonmakers, heing suitahle for wheels, treenails, helaying pins, and ia considered the strongest wood in the colony; also valuahle for railway sleepers, underground work in mines, etc.

The wood of the Gums is "so soft at first as to render the feeling, splitting, and sawing up of the tree, when green, a very easy process, but when thoroughly dry hecoming as hard as oak.

When we consider the fact of the great number of farms in California that are nearly or wholly destitute of wood, and the great and continuous expense entailed by our eystem of fencing, the importance to the farmer of dedicating a portion of his land to the cultivation of forest trees, from which he can ohtain fuel, and fencing materials, is too palpahle to admit of dehate. The comparatively small expense and labor with which the cultivation of a few acres for the purposes I have named is attended, its absolute feasibility and practicability, with the heneficial results that would flow therefrom, ehould commend itself at once to every farmer, as a few acres of timher land for economic purposes would add much more than the cost to the cash value of a farm. The boundaries of a farm should be marked hy a row or rows of trees, thus defining its limits hy living monuments, and greatly adding to ite heauty—from theee rows as the treee advance in growth and age, some wood could he cut, and where the farm is of considerable size, enough in the way of trimmings or prunings to supply the fuel of the house. In the treeless areas of tbe southern part of the State, the varieties of the Acacia ahove named would prove an important aid iu assisting by their protection the planting of other species of timber; as they are easily taken care of and will stand excessive drouth. They would also he useful as is our Monterey Cypress, *(Cupressus macrocarpa)* for belts to break the force of the winds in exposed places, and it is to be hoped that hefore many years, timher helts for this purpose will he common wherever the coast winds prevail, as a protection to orchards and vineyards.

Our Native Trees.

We have many native trees well adapted for timber or wind-hreaks, and while calling the attentiou of land owners and others to the exotic forms ahove mentioned and their special qualities as enumerated in Dr. Mueller's excellent paper, I do not wish to he understood as making an unfavorahle comparison as against indigenous species, as for some of the purposes mentioned they will answer equally well.

It must he remembered, however, tbat our foreats are unfortunately deficient in many of the hardwoods much naed in the arts, and which we are now compelled to import from localities more favored in this respret. The aggregate amount annually sent out of the State for the purchase of thia material could hy proper foresight and enterpriee, in a few years, he retained within our own horders, and here expended in the estahliehing of new industries pertaining to the very material, the manufacture of which in other portions of the Union employs large communitiea, to whose support we are now contributing.

As in Germany to anticipate a future need our own *Sequoia pervirene* or Redwood tree is extensively cultivated, so here by the cultivation of the Australian Eucslypti we can in a few years aupply a positive want, and reap the advantages ahove indicated.

Since the reading of the ahove paper I have had many questions asked me by persons not present at the meeting of the Academy, and as an answer to said inquiries and to various propositions I have added the following:

Planting and Trimming.

Some objection has been made to the Acacias and Eucalypts hy persons who have planted them for shade or ornamental purposes in the neighhorhood of San Francisco, for the reason as alleged that they do not withstand the winds. So far as the observations of myself and others who have investigated the matter extend, it is really surprising that so few are proetrated. The fault is not with the trees hut the purchasers; as treee of from four to eix feet in hight are sold at a low price, they are hought by partiee who require only a few, in preference to smaller trees, as they make a greater immediate show. As most of the growth of the trees as uenally purchaeed, after having attained a hight of six inchee, has heen made in the pot or box in which they are sold hy the dealers, it will he readily perceived that the tap-root which in a natural state descende, ie diverted from a perpendicular into a rotary direction, analogous to a epiral spring, and is also crossed and recrossed on itself—with the liahility as it increasee in size to atrangle the tree by one portion of this root making a short-turn or twist upon another part of the eame, or hy heing wound ahout and restricted by the lateral roots. It is therefore apparent that the hetter policy would be, even where only a few trees are wanted, (and thie remark appliee with eqnal pertinence to all trees) that other thinge heing equal, euch as comely ahape and healthy condition, the younger and smaller trees are really cbeaper at the same price than the larger, and can generally he obtained for much lees. For foreet culture the smaller trees are indispensahle to success.

Again it is frequently the case that the lower branchee are trimmed off to a mischievous extent, which also ie a mistake; for where a tree has eufficient space to grow in, but little trimming ie neceasary, and it is a false taste which seeke to improve (?) upon nature by depriving a tree of its normal physiognomy and distinctive character by carving it into grotesque or inappropriate shapes; it is aimply mutilation, and is certain to result in the premature decay and death of the victim. The flattening of the head hy certain ahoriginal trihes, and the distorted feet of the fashionahle Chinese ladies, are further and pertinent illustrations of analogous hideous violations of natural form.

In compliance with my request to Dr. Arthur B. Stout, of this city, for a relation of his experience with the Eucalyptus in connection with his medical practice, I have received the following:

MR. STEARNS:

Dear Sir: In response to your invitation, I am happy to contribute to your important article on the culture and uses of the Eucalyptus in California, my experience of the medical properties of that valuable plant. The Eucalyptus is not lees precious for its medicinal virtues than it is ornamental in arhoriculture and useful in the arts. Several months ago, incited hy information derived from the *Practitioner* and other sources of knowledge, I collected and dried the leaves. The agreeable empyreumatic oil of the leaves, in evaporating, diffused a halmy odor through the house. I therefore considered that as this oil, as well as the catechu gum and kino, and the cajeput oil, are all similar hydrocarbons, their qualities must reeemble the creosote, pyroligneous and carholic acids in their disinfectant and hygienic propertiea. I have no douht that Eucslyptus has theee properties in a milder or weaker degree, only differing in being accompanied with an agreeahle perfume, wanting to creosote and carbolic acid. As a purifier, therefore, of the musty atmosphere and unpleasant emanatious in hasements and cellars, I have recommended the scattering of the dried leaves in such places. The powder of the dried leaves acattered in trunks and among clothes will no douht he as useful and more agreeahle than tobacco or camphor to prevent the growth of moths or other inaects.

Medicinal Value.

Its chief value ie, however, as a sedative and antieeptic in asthma and throat diseases, nasal catarrhs, and affections of the mucous membranes. To utilize these properties I had a concentrated tincture with alcohol at 95° preprepared by Messrs. Steele & Co., and also contrived an inhaler with which to introduce the vapor of the essential oil to the throat and lungs. I can teetify to the excellent effect of this mode of medication. The paroxisms of chronic asthma are relieved and shortend, and acute attacks are quickly allayed. The inhaler is a simple instrument made of tin. It is a cup of a capacity of 4 fluid ouncee; the lid, attached hy a hinge, has a tuhe from the centre ahout three inches high, bent near the end at a right angle, and terminated with a mouth piece like that of a epeaking trumpet. The cup is on legs so that a spirit lamp may be placed underneath, and has a wooden handle to move it ahout when heated. Put two ounces of boiling water, (4 tahlespoonfuls) in the cup; add one tablespoonful of the tiucture; and inhale the vapor, while the fluid is kept gently boiling with the spirit lamp. Again, I had prepared cigarettes with the coareely powdered leaves. These produce a decidedly anodyne and antispasmodic effect. An agreeable ayrup may aleo be prepared, useful in infantile maladies.

There can he little doubt hut that the oil of Eucalyptus, and Eucalyptine when it can be procured, will be available remedies against malarious diseases of all typee, and that the presence of the trees, cultivated in gardens, contribute to sanify the atmosphere from those emanations which give origin to epidemic diseases. That the parasitic insects which infest other plants do not relish the Eucalyptus is evident from the general cleanness of the leaves and the fact that the hydro-carbon oils are fatal to animal life. The balmy perfume, therefore, that exhales from them, must have an influence in destroying the parasitee which frequent shruhs growing in their vicinity, tending to diminish if not suppress them.

Its General Acclimation.

Iu corroboration of the advantages to be obtained by the cultivation of this Myrtacea, may be shown the efforts made during the last fifteen years to acclimate it in Europe and elsewhere. Ramel hae euceeeded admirahly in introducing thie tree in Provence (France), in Spain, Italy, the islande of the Mediterranean eea, and in Algeria. It appears in the botanical gardens of Germany (Munich); and in Vienna, Austria, an apothecary, Lamaleh, has

raised 3,000 specimens from seeds. From these he has prepared tinctures and oils for medical purposes.

See annual report of Wiggon and Husemann of progress in Pharmacy, etc., Gottingten, 1871.

By the assidnity of Dr. Pigns-Dupnytreu, this tree has been carefully cultivated in the garden of the French Hospital of the Mutual Benevolent Association. So, that institntion enjoys already the bcnefit of the tree hygienically, and has its supply of leaves for tinctures and syrups. The leaves steeped in boiling water are also nsed as a ptisane or beverage.

However obnoxious to parasites in general this tree may be, it appears it nevertheless has its own species in the Psylla Eucalypti. This insect is an Hemipteron, and appears on the Eu. dumosa. It deposits a species of manna, called in Australia *Lerp* or *Luap*. It is a white substance, 53.1 per cent. of sugar syrup and 46.9 p. c. of a s pecial modification of starch. This is prized by the inhabitants as a Manna; and is greatly sought for by the bees, who convert it into honey. Dobsou (entomology) describes it as the cup-like coverings of the Psyllidæ, but Wittstein mentions six varieties of Psylla, and that one species produces a colored Lerp handsomer than the white, but as a deposit beneath the cup like shields of the insect.

See same annual, Göttingen, 1870.

If this insect derives his Lerp from the aromatic and balmy oil of the Eucalyptus, and furnishes an agreeable aliment for the inhabitants, and a Mt. Hymettus-like honey stuff for the bees, certainly the busy little insect manufacturer, parasite as he is, may be freely pardoned. Very respectfully yours,

A. B. Stout, M. D.

From experiments recently made upon myself, I find that small doses, 3 ij to 3 iij, of the infusion of the leaves (of young trees) drank when cold, quiet the nerves and induce sleep; quite likely, in ordinary cases of wakefulness, a pillow stuffed with the leaves would produce the same result. My friend, Dr. Kellogg, has prescribed the infusion in dyspepsia, and reports favorably. In addition to the many valuable properties of the Blue Gum herein recited, I have no doubt but camphor in considerable quantity can be obtained from it.

Useful Information.

Correcting Echos in Large Halls.

We clip the following from the Bloomingtou, Ill., *Pantagraph*. "On Mouday we took some observations in the court-room for the purpose of ascertaining the effect produced by the wires stretched across the room, for benefitiug the acoustic properties of the same. Most of our readers are aware that it has hitherto been a subject of remark, and noticed by every one, that it was almost impossible to hear distinctly in the body of the court-room what was said in an ordinary tone of voice within the bar. This is now remedied. Mr. W. S. Carlock suggested that the stretching of small wires at a proper hight and at suitable distances would be of great benefit. This has been tried, and the effect proves to be a vast improvement.

"We entered the room, Monday, while Mr. Ewing was addressing the jury in an ordinary and easy conversatioual tone of voice, and found no difficulty in distinctly hearing every word. We tried in various places from the remote corners to the center, and fouud it about the same. It appears to be a success. The theory is that the wires, although so small as to be hardly visible, break the sound waves, and prevent the reverberation which has hitherto been the chief obstacle and annoyance to listeners. Only three or four wires crossing the room each way produce this improvement."

We invite all who have occasion for it, to verify this experiment and communicate the result to us, for the benefit of those readers interested in this matter.

Linseed Oil.—Linseed oil is made from the seeds of the flax plant (formerly called lintseed), by grinding them in a mill, and pressing the powder by hydraulic or other power. When first pressed it is of a golden yellow color, but soon collects impurities from the air and turns brown. The impurities can be washed out by stirring water into it thoroughly, and leaving the water to settle. It contains no stearine, and hence does not congeal ata low temperature. Its chief use is in decorative and preservative painting. Being mixed with the powdered colors, and spread on wood, stone or iron with a brush, it soon dries and hardens into a coating which acts as cement, varnish, and shield from weather. To quicken ita drying it is often boiled before using. It is sometimes used in medicine as a laxative, and for this purpose is made from the raw seed without roasting. It is quite an important article of commerce.

Longevity in Ecuador.—In the mountain town of Coxamarca, in the year 1862, there were seven persons—one of whom was then 114 years old, one 117, one 121, one 131, one 132, one 141, and the seventh had reached the extreme age of 147 years. One of these patriarchs at his death left 200 descendants to mourn his untimely end.

What is Arsenic?—It is not yet settled among chemists whether or not arsenic is a metal; it is not absolutely known whether it is not itself a compound; the elements of it, if it is a compound, are of course not known.

Gas Swindling.—In alluding to the miserable quality of gas usually supplied to consumers, and the high price generally charged for it, the *Journal of Applied Chemistry* says:—"The custom of paying for gas by the cubic foot, is like buying all cloths at a uniform price per yard, without any question as to the fineness of the wool. No one would like to pay as much for shoddy as for cassimere, and yet shoddy gas is the principal article now furnished to customers, while the price actually paid calls for the best gas that can be made. It is really surprising that a monopoly of such a monstrous character should be permitted to maintain itself so many years in an enlightened community. The city companies should be compelled to furnish gas of a prescribed density, and fixed candle power. Some of the London companies pride themselves on keeping up the illuminating powers of their gas to the maximum standard of fifteen candles.

Besides the loss to the consumer in the amount of light afforded by a poor gas, there is another difference which tells in favor of the company. Assuming the specific gravity of poor gas to be 5, and that of rich gas to 750, the former will pass through the burner much faster than the rich, and increase the bills of the consumer from 30 to 50 per cent., without any correspondent increase in the photometic power of the gas."

From all this it would seem certain that there ought to be a fixed municipal standard, say fourteen or fifteen candles, prescribed by law, and an inspector appointed to see that the companies comply with it; and in case of any breach of coutract, a heavy penalty should be imposed. Let us be no longer intimidated by the bugbear of a paternal government, but insist that swindlers who rob the poor, in order to divide 100 per cent. dividends, shall be baffled and punished.

Sawing Wood Without a Saw.—Dr. George Robinson of New York, say *Moore's Rural*, has invented a process of cutting wood by passing a galvanic current over a platinum wire in sufficient quantity to raise its temperature to a red heat. He has found that gently pushing a piece of wood against a red-hot platinum wire, especially when aided by a slight sawing movement, the wood was divided in any required direction as by a handsaw, and, of course, without any effort of skill or appreciable expenditure of muscular power. The *Scientific American* says: "By arranging the wire with handles or other means, so as to guide it readily, the lumber, whether in trees, logs, or planks, may be cut easily as desired. There is here, therefore, a simple and easily applied force, which, in a child's hands, my be employed to fell trees, divide them into logs, and, in short, perform all the operations of the saw and the ax. The surface of the wood where thus divided, is, of course, slighty charred, bnt the black layer is very thin, and for many purposes not disadvantageous, as it is known to preserve timber. The battery employed need only be of the simplest character, as quantity, and not intensity, of current is required."

Marvels of the Insect World.—The *Spectator*, in its notice of M. Touchet's work, "The Universe," says: "Man generally flatters himself that his anatomy is about the highest effort of Divine skill; yet that of the insect is far more complicated. No portion of our organism can compare with the proboscis of the common fly. Man can boast 270 muscles. Lyonet, who spent his whole life in watching a single species of caterpillar, discovered in it 4,000. The common fly has 8,000 eyes, and certain butterflies 25,000. M. Touchet treats it as an established fact that so fine are the sensory organs of ants that they converse by means of their anteunæ. Consequently the strength and activity of insects far surpass ours in proportion. In the whole field of natural science there is nothing more astounding than the number of times a fly can flap its wings in a second; it must in that point of time vibrate its wings five or six hundred times. But in rapid flight we are required to believe that 3,600 is a moderate estimate."

Varnish to Protect Polished Metals from Rusting.—Dr. C. Pascher recommends the use of a solution of paraffine (one part by weight in three parts of petroleum) as a varnish, which may be usefully applied to polish metals, especially as, after having brushed this liquid over the surface of the metals, they may be gently wiped clean with a soft piece of flannel, so as to leave only a very thin film of the varnish, yet sufficient for the protection of the polish.

Why Colored Persons Stand Heat Better than White.—It is alleged that colored peraons are never sunburned because the dark color of their skin absorbs the heat and conveyait into the system, so that it is converted into sensible heat, producing perspiration. But the white skin does not absorb the heat; the sun's rays therefore rest upon and burn it.

Non-inflammable Fabrics.—Carteron and Rimmel have taken out a patent in England for the use of acetate of lime and chloride of calcium for rendering goods non-combustible. Equal weights of each are dissolved in twice their weight of hot water.

Pulverizing Camphor.—If a few drops of Castor-oil be added to the alcohol employed, in the proportion of 1 to 24 or 30, the camphor is much more easily reduced to powder.

Good Health.

Effect of Arsenic on the Human System.

The first effect of arsenic when administered is local. It is classified as an irritant, bnt not a corrosive poison—that is it inflames the parts it comes in contact with, without destroying or softening or perforating them; the local effects thus first produced cause local symptoms; these appear generally in an hour after the poison has been swallowed. They are: burning pain in the stomach, which, as the poison passes down, extends along the intestinal tract. It increases in severity, is accompanied by great thirst, dryness and constriction of the throat, vomiting and purging.

The matters vomited are dark, bilious and offensive. By this time more or less of the poison has become absorbed; it enters the blood and produces a second class of symptoms called remote, the action being apparently mainly upon the blood corpuscles; these symptoms are characterized by great prostration of strength, anxiety and depression of mind, a peculiar lividity of the face, a blue line under the eyes, the intellect being as yet unaffected and the mind clear; death may ensue at this stage of the action, due to the prostration; usually takiug place under these circumstances, in from one to eight days.

If life be continued, the effect of the arsenic is apparent upon the nervous system and brain; stupor, passing into profound coma, may develop itself in case the action is primarily upon the brain, delirium and convulsions, passing into tonic spasms, in case the spinal cord is also involved, may precede death; all of these symptons may not be present in any one individual; the patient may recover from all these symptoms, which may be called primary, and may die from the secondary effects of the poison years afterwards.

White arsenic, when taken into the stomach, is dissolved both in the stomach and intestines by the gastric and intestinal juices; spread out upon the posterior surface of the intestines, is a set of blood vessels which compose what is known as the portal system; the arsenic thus dissolved passes into these blood vessels through their walls; these vessels unite, thus forming the large trunk known as the portal vein, which empties itself directly into the liver, so that this organ is not only more fully supplied with blood than any other, but it is supplied with blood charged with arsenic from the intestines; hence the liver is more likely to contain this poison than any other organ. It passes from the liver into the general circulation, and thus produces its remote effects. Most probably it does its fatal work on the blood itself, disintegrating the blood-corpuscles, thus rendering the blood unfit to perform its functions.

From 2½ to 3 grains of arsenic would kill an adult; less quantities than that have been fatal; and more has been taken without producing death. Arsenic would not probably be found if death ensued from the secondary effects. Persons have died from the primary effects of arsenic in eight days, and no trace of the poison has been found in the body on analysis. Constriction of the throat, when arsenic is taken, occurs in from one-half hour to an hour ordinarily.

The effect of arsenic on the heart and lungs is as follows: The pulse during the great prostration is generally small and rapid, and sometimes, when the prostration is very great, the pulse is less rapid than usual; the respiration is difficult, requiring a voluntary effort to breathe; it is sometimes quick and sometimes slow; the action of the poison on the lower intestines is to produce tenesmus; i. e., straining without result; inflammatory action produces a dry and hot skin at the first stages; during collapse the skin is cold and clammy and sometimes moist; the inflammation causes dryness and a folding up of the mucous membrane; there is also more or less faintness; sometimes entire syncope; purging may be wanting; convulsions are exceptional; the same is true of delirium.

Persons have been poisoned by rubbing arsenic on the head; the article that has produced it, is called Fowler's solution. Persons are also known to have died from sleeping in rooms papered with arsenical green.

Asparagus for Rheumatism and Gout.—A medical correspondent of an English journal says the advantages of asparagus are not sufficiently estimated by those who suffer from rheumatism and gout. Slight cases of rheumatism are cured in a few days by feeding on this delicious esculent, and more chronic cases are much relieved, especially if the patient carefully avoids all acids, whether in food or beverage. The Jerusalem artichoke had also a similar effect in relieving rheumatism. The heads may be eaten in the usual way, but tea made from leaves of the stalk, and drank three or four times a day, is a certain remedy, though not equally agreeable.

Wash for Sunburn.—Take two drachma of borax, one drachm of Roman alum, one drachm of camphor, half an ounce of sugar candy, one pound ox-gall; mix and stir well for ten minutes or so, and repeat this stirring three or four times a day for a fortnight, till it appears clear and transparent. Strain through blotting-paper, and bottle up for use. It is said that strawberries rubbed over the face at night will remove freckels and sunburn.

Instinct of Appetite.

It is nearly always best to consult the instinct or appetite as the kinds of food children eat. The quantity needs to be guarded far more than the quality. Where there seems an overweeing desire for a particular dish, it may pretty generally be presumed that some element in it is required by the child's system, and it is better to gratify it even to what may seem an intemperate degree than to unduly restrain it. When the system is fully supplied with the constituent it needs, it will cease to turn greedily toward it.

Dr. Hall's injunctiou is, "never in sickness or health to force your children (or yourself) to take ons single mouthful of food or drink that they do not like." This is against very much of our common practice, and whether or not it be a fact that such a rule should have no exceptions, there can be no doubt that in general it is much safer than the more arbitrary method. It does not, by any means, sanction the giving of a sick child everything it does like, though even if this were done in minute quantities the danger probably would be less than in stuffing it with that for which it has an aversion. In sickness there is often a morbid appetite, which craves more food than can safely be allowed, but a morbid appetite and a prevented one are different things. Most of us can recall occasions when a much craved but forbidden dish justified our instinct by proving really beneficial in spite of being surreptitiously obtained. "Begin by taking a little at a time of what is so urgently craved, and feel the way along to an amount which nature can bear."—*Ohio Farmer.*

Death From the Bite of A Skunk.—Mr. N. Douglass, of Kassel, Kansas, recently died from the effects of the bite of a skunk. On the 13th of June last, he complained of an unpleasant sensation in his thumb, which he at first thought was the incipient stages of a felon; but, on consultation with a physician, he subsequently referred it to the bite of a skunk which made a grip at his thumb as he was camping out on the prairie about five weeks previous. The savage animal could not be made to loosen his hold till pounded nearly to death and choked off.

On the 14th the pain extended up the arm, reaching the shoulder, with sharp pains shooting through the chest, the pain in a measure leaving the thumb. On the 15th, Mr. Douglass complained of a choking sensation in the throat and a difficulty of breathing, and could swallow only with great effort, but appeared cheerful and hopeful, and was about nearly all day, visiting different business places in town. In the evening, at about 7 o'clock, the doctor was sent for in great haste, and found him in a raging condition, could not get anything down him or into his mouth, and found that he had eaten nothing during the day. Every breath-stirring, or the slightest disturbance, brought on these paroxysms. The doctor did all that medical science could do to relieve his patient, but to no purpose, only to allay momentarily. From this time on he continued to grow rapidly worse, the paroxysms more frequent, harder, and of longer duration, until death came to his relief at half-past 3 o'clock on the morning of the 16th.

Treatment in Small-Pox.—A correspondent, "Q. A. T.," sends us the following: "The clay dressing may be good in small-pox, bnt is not so pleasant as a remedy. I tried it when visited by that complaint in its most malignant type, some years ago. We had two cases, and although decidedly "Eclectic," we called in a homœpathic physician. The first case was badly marked. In the second, the disease, up to the time the pustules appeared all over the body, seemed as virulent as in the first case, and then almost immediately (in a few days) subsided, without leaving a scar. The progress and usual course of the disease seemed arrested by the free application of thick sweet cream to all parts of the body. In some instances the disease is aggrevated by the close room and extra cover, which the kindness of friends force upon the patient. Let them have an open window and light cover in the coldest season, if the ground were covered with snow.

The Cotton Plant Root in Medicine.—The root of the cotton plant, which is employed as medicine, has been subjected to careful chemical analysis by Professor E. S. Wane. He obtained from the root a dark red resinous mass, inaoluble in alcohol, ammonia, chloroform, and ether, but soluble in caustic solutions of soda and potass. It contains no alkaloid principle. He concludes that it is an acid resin, and suggests for it the name of gossypic acid.

Remedy for Toothache.—Powdered alum, two drachms; spirits of ether, seven drachms; mix, and apply to the tooth. Another: Chloroform, one ounce, alum, five grains; morphine, three grains; mix and apply with cotton.

The Cause.—Paul Bert, in an article in *Comptus Rendus*, ascribes the cause of death of fresh-water fishes when placed in salt-water to the chlorides present in the latter.

Cramp Colic.—It is said that two pills of gum camphor swallowed will give relief in twenty minutes.

MINING AND SCIENTIFIC PRESS.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY, W. B. EWER, GEO. H. STRONG, JNO. L. BOONE.

Office, No. 338 Montgomery St., S. E. Corner of California St., diagonally across from Wells, Fargo & Co.'s.

SUBSCRIPTION AND ADVERTISING RATES.

ADVERTISING RATES.—1 week.	1 month.	3 months.	1 year.
Per line.....	.25	.80	$2.00	$5.00
One-half inch.....	$1.00	$3.00	7.50	20.00
One inch.....	2.00	6.00	14.00	36.00

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper, inserted at special rates.

SUBSCRIPTIONS payable in advance—For one year, $4; six months, $2.50; three months, $1.25. Clubs of ten names or more, $3 each per annum. $5, in advance, will pay for 1½ year. Remittances by registered letters or P. O. orders at our risk.

English and Colonial subscriptions, post paid, per year, £1 3s.; 6 months, 12s. Advertisements, per line, first insertion, 1s.; subsequent insertions, each, 6d. Large advertisements at special rates.

ILLUSTRATIONS AND REPORTS OF MINING ENTERPRISES WANTED.—Drawings or photographs of mining works that are of general interest to our readers are solicited for publication in this journal. Official reports of Companies, and descriptions of mines of importance, of special interest, are also desired. Sketches of any new method and discoveries will be very acceptable.

Gold and Legal Tender Rates.

SAN FRANCISCO, Thursday, August 1, 1872.—Legal Tenders buying, 87; selling, 87¾. Gold in New York to-day, 115⅝.

Table of Contents.

ILLUSTRATIONS.—The Lightning Mill; The Goodwin Pump, 65. Steam Plowing, 78.
EDITORIALS.—The Emma Mining Suit; The Mint Contract; The Diamond Fields of the Pacific Coast, 72. Revolution in Wine Cask-Making, 73.
MECHANICAL AND SCIENTIFIC.—A Manageable Balloon; Soldering Fluids; Iron in the Blood; A new Motive Power for Ships; The Weather and the Gulf Stream; An Immense Bridge Structure; Moving Railroad Trains by sail, 67.
USEFUL INFORMATION.—Correcting Echos in Large Halls; Linseed Oil; Gas Swindling, Sawing Wood Without a Saw; Marvels of the Insect World; Why Colored Persons Stand Heat Better than White, 71.
GOOD HEALTH.—Effect of Arsenic on the Human System; Asparagus for Rheumatism and Gout; Instinct of Appetite; Death From the Bite of a Skunk; Treatment in Small-Pox, 71.
DOMESTIC ECONOMY.—Rice—Its History and Value: Salad; How to Distinguish Edible Mushrooms, 74.
CORRESPONDENCE.—Notes of Travel in White Pine County, Nev.; Giant Powder in Bank Blasting, 66.
MINING SUMMARY from various Counties in California, Nevada, Arizona, Colorado, Montana, and Utah; Mining Shareholders' Directory; Stock Report, 68-9.

Substantial Appreciation of the Mining and Scientific Press.

During the past four weeks we have received over 262 new cash subscripions from a portion only of the State of Nevada, visited by our excellent agsut, Mr. L. P. McCarty. Since the commencement of the present improved volume an unueual number of renewals have been received hy us from other parts of Nevada, California, Utah, Colorado, Idaho, Moutana, and other Mining sections. Our extra labor and expense upon the MINING AND SCIENTIFIC PRESS being thus appreciated, we ahall not relax onr energies in making a still better paper.

To this end we invite friends of the interests which we represent to assiet our agents in obtaining information to enrich our columns as well as dollars to meet increased expenses. Intelligent and practical men are cordially invited to send us reliable information, not only of important discoveriee, extensive operationa, etc., but write us also their daily experiences which may be a guide and help to others who may be engaged in the eame businees. A few minntes spared now and then in the evening to write to the paper, will not be lost, since descriptions of certain localities or mines, turn pnblic attention to them, and, in the case of new districts particularly, will he of great benefit by furnishiug information which it would be difficult otherwise to get.

BAY DISTRICT HORTICULTURAL SOCIETY.—The next annual exhibition of this Society will he open to the public in their new and splendid hall, corner of Post and Stockton streets, on Thursday, the 22d of August, and will continue for fifteen days.

STOCK REPORTING INSTRUMENT.—The New York Gold and Stock Reporting Instument, a recent invention, for reporting the enlea and pricee of etock in the hoard, to auhscribere at their office by telegraph, is now in practical operation in this city.

The Emma Mining Suit.

The great Emma Mining snit, which hae been creating so mnch interest, both here and ahroad for the paet fewweeks, has heen brought to a tsrmination, temporarily, at least, much to ths satisfaction of csrtain intersated partiee and to the puhlic in general. We have been furnished with the facts in the cass which will be interesting to our rsaders. This was a suit in equity in which ths plaintiff, the Emma Silver Mining Co. prayed for a preliminary injnnction to rsstrain the defendsnts, the Ciucinnati and Illinois Tnnnel Co. from continuing certain alleged wrongful acts, during the pendency of an action of trespass hrought by the plaintiff against the defsndents for alleged trespass upon certain Silver Mining property, claimed by the plaintiff, but in the possession of the dsfsndants.

The suit has without doubt been one of the most remarkahle and important casee ever know in the history of mining litigation, as not only were the pereonal intersats of a few parties concerned, hut certain principles were involved wbich ars of vast moment to all miners, and holders of mining property in Utah. Perhaps if the immense capital of the Emma Co. had alons besn at stake the case might not have excited such universal intersst; bnt the most of those who wsre acquaintsd with the facts of ths case fslt that there were questions of issue, the decision of which would very materially influence the future dsvelopment and prosperity of the entire territory.

A Brief Review of the Case

May not be uninteresting to onr readers. The celebrated Emma mine, situated in Little Cottonwood District, was located and partially developsd in 1865, by csrtain parties who are now some of ths defendants. Its discovery did not cause any excitement whatever; in fact so little was known of its true value, that a practical miner refnsed to waste his time in working upon it, simply for the remunsration of a certain number of feet. Afterwards the mine was sold to an organized company called the "Emma Silver Mining Co. of Utah, and in May, 1871, this company dieposed of all their interest to the Emma Silver Mining company, of New York. In August Angust, 1871, a Government patent was obtaioed for ths mine, and in November of the same year, the New York company sold the mine to the plaintiffs for ths sum of $2,500,000.

For some tims past the defendants have been working a tunnel on the same hill, called the Cincinnati and Illinois tunuel; austansibly for the purpose of devsloping three mines, known as the Monitor, Magnet, and Cincinnati lodes. In April last, the men at work upon this tunnel broke through some of the Emma works in the weeterly part of what is claimed to be ths devsloped portion of the mine. The Emma workmen etopped up the break, and for nearly two months there appears to hava been no furthsr interference. But in the early part of Jnne, on account of a thaw on the mountain, a portion of the Emma caved in and for awhile work had to be euspended. When the Emma workmen again auceeeded in penetrating to the place where the break had heeu made, they found the developed floors in that part of the works occupied by the tnnnel company, whose employée forcibly held possessiou, and drove hack the Emma workmen. This ground contains large quantities of very rich silver hearing ore, and ia claimed by the Emma Co. as a part of their mine. The Illinois Co. contend that it is a separate deposit, and hence tbe suit in queetion.

The Evidence.

Tbe case came up in the Third District Court, Cbief Justice McKean presiding, and occupied several days in hearing. The evidence on both sides consisted mainly of affidavits of mining engineers and experts, whose testimony was as conflicting as can well he imagined. Several gentlemen who had large experience in practical mining, in different parts of the world, and who were mineral engineers by profession, and accquainted with geology aud mineralogy, testified on the Illinois side, and gave it as their opinion that the deposits were separate and distinct, and that their was a break hetween them which existed before the formation of the ore deposits. On the part of the Emma Co. a large number of other gentlemen, also engineere and experts skilled in mineral science and with experience varying from five to twenty years, gave evidence that the Emma deposit was one continnous body of ore, and what was claimed as ths Illinois dsposit was nothing but a part of the Emma lode, and that there was nothing hetween the different works to break a continuons ore connection. It was fully proven by two of the employés of the Emma Co. that from the spot where it was claimed there was barren rock forming a break, specimens of ore had bsen taken only two fest apart which assayed from $75 to $295 in silvsr to the ton; and that first-class ore had been taken from directly under this spot and shipped to England.

The Argument.

After ths evidencs came the arguments of the learned counssl, Hempstead and Kirkpatrick, L. P. Poland, W. M. Stewart and C. J. Hillyer, for plaintiff; Marshall and Carter, J. C. Royle, E. S. Joelyn and C. W. Bennett for defsndants. Although the arguments on both sides were able and sxhaustive, yst in one way, the least said about them the better, as they aboundsd in psrsonalities not expressed in the choicest or most elegant language. "Scoundrsl," "thief," and "swindler" are not the most dignified tsrms for conneel to address to each other, and it is to be regrstted that in this important case a little more calmness and decornm had not bsen observed.

The Decision.

The decision of Chief Justics McKean was deliversd in the presence of several hundrsd peopls, and was rsceived with universal satiefaction, becanss it was concsded to be honest and just by all classes disinterssted ae well as interested. After reviewing the testimony at lsngth he said that the court fully understood the magnituds of the cass and had considered it with great care, and was conetrained to reach ths conclusion that the hody of ore known as the Emma mine, and the body of ore in posseession of the dsfendante wsre parts of one and ths same deposit of ore; that the patent issued hy the United Statss conveyed to ths plantiff ths body of ore in dispnte, and that ths injuuction must issue. Suhsequently the injunctiou was issued iu accordance with ths praysr of the plantiffs' bill, and the Emma Co. put in possession of all the works, and the dsfsndants' prohibited from working the tunnsl or extracting any more ore whatever, or in interfering with with any acts of the plantiff.

Quite nniversal satisfaction was manifested at the result of the trial, and it is hoped that this decisiou may bs a precsdent for all eimilar suits in the future, as it is felt that an adversse dscisiou would have materially retardsd the progrsss of ths Tsrritory and would have deterred capitalists from investing in our mines, aud honest meu from engaging in mining pursuits iu Utah.

The Iron Contracts for the New Mint Again.

Iu our issne of June 29th ws made some comments upon the apparsnt unfairnsss manifested in giving out the contracts for the new mint building in this city, and we now notice that the Washington correspondent of the *Bulletin* of a late date, gives a partial and one-sided statement of the case, which does injuetice to the California hiddera nnder the first advertisement of proposals. If the reader will compare this statement with the facts eet forth in our issue ahove referred to, and which are not and cannot be controverted, it will be seeu that manifest injustice has beeu done, and that the Government is eeeking to add still more to the wrong by a prosecution of the boudsmen in a matter where hoth the facts and equity are altogether on the side of the defeudants, as cannot fail to be shown when the case comea to trial. The bond waa given on the express stipulation that the contract, if awarded, should be coneistent with the propoeal, which any one who reads hoth can see is not the case. During the unueual delay of 101 days after the date of proposals, iron had ao advanced in price, that a large loss to the contracters would have occured which would have been avoided had the Government given notice of acceptance within 15 or 20 days, which would have heen a reasonable time. This is a feet which was overlooked in our first notice, and which should he added to the unreasonahle time unnecessarily required for the performance of certain portions of the work.

DITCH COMPLETEN.—The Burnet river ditch in Baker county, Oregon, haa been completed, and the water turned in. This ditch is ninety-six milee long, cost over $400,000, and will open up a rich mining field.

Diamond Fields on the Pacific Coast.

Interesting and Important Discoveries Reported.

The diecovery of diamonds on the Pacific Coast is no nsw thing; they are occasionally found in a grsat number of localities, hut nowhere, heretofore, so plentifully as to make a special search for thsm profitahls. But during the past week a most nnusual sensation has been crsated in this city by ths allsgsd discovery, in great abundance, of diamonds, ruhise, sapphires, etc., in a locality somswhere in or near Eaetern Arizona. The prscious stones havs hesn on exhihition, and have heen seen by thoueands.

From ths reports of the parties interested, it appears that about three ysars ago soms psreons employed hy Meesrs. Robsrts & Harpsnding in prospecting for gold and eilver in Eastern Arizona, met, and obtained from an Indian soms precioue stonss, rubies, diamonds, etc., which hs claimed to have found in that vicinity. These stones were brought to this city, tested hy lapidariss and pronounced genuins. Upon the strength of these facts, immediate steps were taken to find the locality whsre the diamonds were obtained, and prospsct the eame. This business was placsd in chargs of Mr. Henry Janin, ths well-known mining euperintsndent, who euccesded in the sndeavor, and obtained and brought to this city a largs quantity of diamonds and othsr prscions stonss—several thousand in nnmber and valued at from one to two hundrsd thousand dollars.

Ths prospecting party aleo reportsd that thsre was quite an sxtensive diamond-bsaring deposit at the locality—embracing an arsa of eome 3,000 acres, throughont which the precious stones wsre found. Upon this information measures were takeu to secure the U. S. title to ths tract, which has now been dons, and a company organized to further prospect and work the same.

The Secret Out.

Up to this time all ths business has been managed with the utmost secrecy. But soon after filing the rscord of incorporatiou, with the heavy capital stock of ten millions of dollare—which was done on Tuesday last—soms ons connected with ths affair became a littls lsaky, aud dropped just enongh to allow some of the city reportere to get hold of facts sufficient to get up a first-class ssnsation item, the result of which, was a frank annonncement of ths whols fair, aud the puhlic display of the diamonds and other precious stones, the very pressnce of which, in this city, had been kept a profound secret for many months.

The Locality of the Discovery.

The prscise locality of the discovery has not yet heeu made known, although it is supposed to hs somewhere uear ths dividing line between Arizona and New Mexico, and probahly not far from the famous Burro mines.

It is claimed that although considerable search has heen made for many miles aronnd the particular location securad, no indications of diamonds have heen fonnd outside of that locality—a very unrsasonable assumption, however, if we are to place any reliance npon what is said of the alleged diecovery.

It is well known that Mr. Jauiu has beeu for some time near the locality alluded to, and is there now. The diamonds have heen on exhibition at the Bank of California and more puhlicly ahown at Mr. Lent'e office on California Street. There can be no question about the genuineness of the diamonds shown. Several huudreds, if not thousands, are shown, varying in size from the head of a small pin, up to that of a good sixed beau, and black diamonds of mucb larger sizea. The names of such men as Milton S. Latham, Thos. H. Selby, Wm. F. Babcock and Maurice Dore, which appear on the list of Directore, would eeem to give assuraace that the discovery and organization is a genuine one.

Further developments will be awaited with much intereat. In the meantime it is to be hoped no uudue excitement will he engendered or rush made for the reported diamond fields. At present, as we have already said, nothing definite is known with regard to their locality. Should further advices confirm the reports circulated, there is time enough and room enough for all who may wish to try their fortunes in that direction.

THE El Dorado South company have purchased a twenty-stamp mill, which will he put up at once, the Company having eufficient ore in their eeveral minee now to supply a mill for aix months to come.

Steam Plowing.

A great deal has been said and written on the subject of steam plowing in the United States; and engines, some to draw the plows by direct traction, others stationary on the sides of the field to be plowed, have been put to use, some drawing three plows, others five, and others again have attempted with as many as eight, and yet it is a fact that with all the skill usually attached to American ingenuity, we have fallen far behind the English in our efforts to successfully cultivate the land by steam plowing.

Fowler's steam plow has been at work successfully for years in England and France, and the Pacha of Egypt has as many as four hundred in steady employment during the plowing season. Land of the same quality, side by side, the one plowed by steam yields forty bushels per acre, the other by horses, yielding but twenty bushels. The cost of plowing by steam is one-third less than with horses, even in Europe where the plowman's wages are but forty cents a day.

Plowing by Contract.

There are establishments in England that employ 1,200 men each in the manufacture of steam plowing apparatus; and there are organized companies who hire out their steam machines or do work by contract, and there are said to be over five hundred steam plows thus held for hire, and parties contract to do plowing from eight to twelve inches deep, for $1 and $1.15 per acre, and plowing from thirty to forty acres per day.

It is not surprising therefore that Americans should be making continued efforts in the direction of some invention that shall equal if not greatly excel the present English steam plow.

An invention has been put to practical test within the past three years in California, on the principle of revolving cutters, that seemed to promise favorable results, but we have not heard of its recent trials or performances. And now Mr. Alexander Campbell, of Yolo Co., submits an invention of his, both as regards peculiarity of engine and its attachment to plows, that seems to merit careful consideration and a full trial, and we are pleased to learn that the "Reclamation Fund Commission" of which G. G. W. Morgan is the active efficient Secretary, has taken the matter in hand. It has also been brought to the notice of the Sacramento Farmers' Club as follows:

Engines for Plowing.

In response to an invitation extended by the Sacramento Farmers' Club, Alexander Campbell of Washington, Yolo county, resubmitted his drawings and also the description of his steam-plowing, ditching and traction engines: "These engines are capable of cultivating from thirty to sixty acres per day of ten hours, from seven to twelve inches in depth, or of cutting one mile of ditching per hour, three feet wide at the top, one foot at the bottom, by two and one-half feet in depth. They may be made available at a moment's notice for any ordinary work, such as threshing, pumping, sawing, hoisting, or as a traction engine. They are fitted with Campbell's compound windlass, expansion frames, telescopic hoisting crane, etc. This windlass has a clip-drum, enabling one engine to be used when wanted, independent of any other, for plowing, etc. The expansion frames take all strain entirely off the boilers, thereby greatly reducing the wear and tear. The cylinders are steam jacketed, and all the gearing and working parts are made of cast steel, insuring the greatest strength and lightness. No other system of steam cultivation can compare with this for thoroughness of work, less wear and tear, and economy of expenses for work alone. The best traction engine known to the public is manufactured by Avling & Porter, of Rochester, England. Their six horse-power engine has an indicated power of thirty-eight horses, and weighs 11,704 pounds. Eighty-three pounds is the tractive power of a horse at four miles an hour.

Power Required

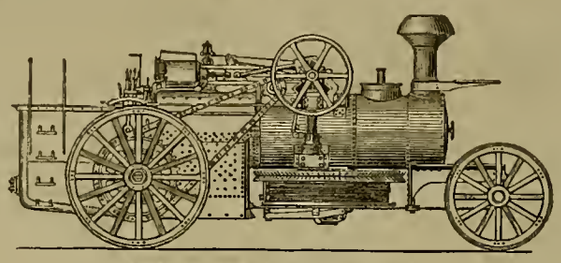
To pull a ton over soft, sandy or gravelly ground requires a strain of 210 pounds. To plow a furrow eight inches deep by ten inches in breadth it requires a strain of 303 pounds. This power would pull five plows in a gang at four miles an hour. This, deducting say fifteen per cent. for stoppages, will give 1 75-100 acres per hour, or 17 24-100 acres per day of 10 hours, at a cost of 1,900 pounds of coal and two skilled men's wages. This assuming five pounds of coal per horse-power per hour. This shows a consumption of 1,160 pounds for actual work done and 750 for propelling the engine. Supposing this engine to be fitted with a 'clip-drum,' the friction of the rope does not waste one-tenth of the engine power; thus we should have 34 2-10 horse-power for actual use instead of 23 2-10. Cost of direct traction—2,000 pounds of coal, $10; two men, $3—$18 for 17¼ acres. Stationary traction—2,000 pounds of coal, $10; two men, $8; two boys, $3—$21 for 27¼ acres. Thus direct traction will cost about $1 per acre, while the rope traction will cost seventy-six cents per acre."

After the reading of the above and the explanation of the drawings by Campbell, I. N. Hoag offered the following, which was unanimously adopted:

"Whereas, Alexander Campbell has exhibited to the Club drawings of a steam-plowing apparatus, an improvement on the English system of plowing by stationary engines, and explained the advantages of stationary engine-power over direct traction; and whereas we are fully satisfied that the productiveness of our soil can be greatly increased by deeper and more thorough cultivation, therefore,

"*Resolved*, That we regard Campbell's improvement a valuable one, and we would be glad to see the plow introduced in our State generally, and hope capitalists who are interested in the agricultural improvement of our State will not hesitate to furnish the necessary means to accomplish this object."

The illustration we present of engine, and field work being performed, were engraved at the Mining and Scientific Press patent agency, 338 Montgomery street, San Francisco.



IMPROVED STEAM PLOWING ENGINE.

THIS DESIGN SHOWS THE ENGINES AT WORK.

Revolution in California Wine Cask Making.

Hitherto all the lumber used for the manufacture of wine casks has been Eastern oak, and this of course has had to be imported at very high rates. For example it now sells retail, at $100 to $125 per thousand, whereas redwood costs only $37½ retail in this market. Now it is quite evident, that if redwood could be substituted for it there would be an

An Immense Saving

Effected in the cost of the casks, and these have always formed the most expensive of the items connected with the manufacture and export of wine. Redwood has been frequently attempted to be used as a material for the manufacture of wine casks, but the experiments with it have generally proved failures, inasmuch as the coloring matter contained in it, has given a bitter and disagreeable taste to the wine. Several manufacturers of wine in the country districts have, however, steamed the casks after making them, and coloring matter thereby removed, the wine kept just as well in them as in oak built casks.

Among the gentlemen who have joined this business, are Arpad Haraszthy, Esq., with Landsberger & Co., Messrs. Pellet & Carver, of St. Helena, Mr. Hood, of Sonoma, and West Bros., of Stockon. The plan of steaming after making, has failed to be entirely successful, on account of the great shrinkage of the wood. However, the Messrs. Fulda and Sons, wine-cask makers, cor. of Commercial and Drum streets, in this city, have solved the difficulty by adopting the process of

Steaming the Lumber

Before making the casks. They are pioneers in the introduction on the coast of steam machinery in the business of coopering, and have introduced several labor-saving machines of their own invention into it, as well as being the first to render of practical use, this change in the material for the manufacture of casks. They receive the redwood at the factory from Mendocino, in large bolts, cut to any size that may be required These bolts are first cut into thicknesses and steamed for a week, in an air tight-box, twenty-five feet long, and capable of holding at once 10,000 feet of lumber. This box is kept all the time filled with hot steam conveyed thither by a pipe leading from the steam boiler. At the end of the week all the sap, coloring matter, etc., is entirely removed, and the lumber comes out half bleached, much shrunken, and not over half its previous weight. The process, moreover, causes the wood to become much tougher and makes the grain closer, as has been proved by practice. The effect of the steaming may be estimated when it is known that sawdust taken from the prepared lumber and steeped for a week is as colorless as mucilage, whereas without, the wood from which it has been taken, having undergone the process, it would be as black as a similar solution of logwood. After steaming it is seasoned and dried, and it is then ready for the process of manufacture. The Messrs. Fulda & Sons are, however, making preparations for the future drying of the lumber by heated steam, and thus effecting a great saving in point of time. The saving effected by the use of redwood is just about one-half the cost of the casks, those made from oak costing about 15c. per gallon per cask, while those made from redwood cost in the neighborhood of 7½c.

The First Cask

Manufactured by them under this system has been for J. R. Snyder, Esq., President of the Wine Growers' Association. It holds 1,700 gallons. Its staves are three inches thick at the ends, and two in the middle. The head is made of lumber three inches thick, the central piece being of oak, with a manhole in the middle. It has 12 hoops made of 2½ by 3-16 inch iron. This firm has also commenced to manufacture tanks similarly from redwood, and have now orders for a dozen from Dr. Crane, of St. Helena. They have also invented

An Apparatus for Filling Tanks.

One source of trouble to wine growers has been hitherto that they have not been able to fill the tanks completely, a small space always remaining between the surface of the wine and the head of the tanks. This frequently caused the wine to sour, but the new invention will preclude all possibility of this happening.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co's. Mining and Scientific Press, American and Foreign Patent Agency, the following are worthy of mention:

Improvement in Rock-drilling Machines.—A. J. Severance, S. F. This invention relates to that class of rock-drilling machines known as boring drills, and is particularly applicable to the Diamond drill. Its object is to provide a revolving attachment for the drilling machine by which the swivel head and drill rod can be turned to any point desired, and in which they can be elevated and lowered as necessary. This is effected by means of two circular castings, which are united by a plate by which to secure to the drilling machine. The castings are provided with circular T-shaped grooves in which lugs from a circular frame move. A slide moves in a longitudinal slot in this frame, and the slide and vertical shaft are steadied by a V-shaped casting. This casting supports a short horizontal shaft and bevel wheel which meshes into another wheel (moving on a friction) on the vertical shaft, and each part of the device is thus supported at the proper point and can be separately adjusted.

Improvement in Wind Wheels.—W. I. Tustin, S. F. This invention relates to a novel device for operating the rudder or guide vane of a wind-mill when placed in a position parallel with the wheel, and it consists in the employment of a vertical rod which is hinged to the vane rod or beam, and extends downward to a convenient point to be operated from the ground.

Improvement in Beadstead Fastenings.—Seneca Jones, S. F. The object of this invention is to provide an improvement in the ordinary fastenings for securing the side rails of a headstead to the corner posts; and it consists in casting upon the extremity of the plate which is fastened to the side rail, a projection which can be countersunk into the rail so as to prevent the plate from shifting from its proper position, and thus disarranging the entire fastening.

Improvement in Gaiping Pulleys.—A. S. Hallidie, S. F. The object of this invention is to provide an improvement upon a former invention, and it consists in hinging or otherwise loosely connecting the two sections or halves of each grip by a suitable joint at their meeting edges along the bottom of the grooves in which the rope lies, so that they will be held closely together when the strain comes upon them.

Cederberg Mine.—The 10-stamp mill of the Cederberg mine in El Dorado county, started up on the 1st inst. The mine, specimens from which have attracted considerable attention in a jeweler's window on Montgomery street, has paid all expenses from the start, no assessment having been levied. They have, moreover, some $13,000 in the bank now. The prospects are reported to be good. The names of the newly elected officers and Trustees will be found in another column.

Camp Floyd District.—A dispatch from Salt Lake states that the first silver bullion from Camp Floyd District, from the English company's works, was received there on the 29th ult. There was a large amount and of the highest pureness ever produced in the Territory.

Quicksilver.—The high price and light stocks in New York and London, give tone to our market, and an advance from the present rate of 85c. is quite possible.

Mill Burned.—The mill at the Eliza mine on Humbug was entirely destroyed by fire on the night of the 28th inst.

Mining Sales.—The Inyo *Independent* reports the sale of the Bennet interest or title to the Santa Maria mine, Cerro Gordo, by P. W. Bennet and P. Reddy, to Wm. Walt, of New York, for $30,000.

The Grass Valley *Union* says that a half interest in the State mine, better known as Perrins, has passed over to Judge Brown, of You Bet. The amount was in the neighborhood of $18,0000.

The Ely *Record* gives the particulars of the sale of the Oneida mine, situated on Panaca Flat, east of the Lightner shaft of the Raymond & Ely. The price paid was $40,000. The purchase was made for San Francisco parties, who will at once place the mine in running order.

Rumored Consolidation.—The Salt Lake *Tribune* has the following item: The rumor gains strength that a gigantic consolidation of mining interests is going on in Little Cottonwood. There is talk of a company organizing with a capital of 20,000,000, which will include all the old-title-men. It is said the object is to "have less law and more mining." We hope this will be the case.

The Lassen *Sage Brush* says the placer miners near Susanville are working by the old process of shoveling the dirt into sluices, and are making from $6 to $30 per day to the hand.

United States Mining Laws and Regulations Thereunder.

[Continued.]

10. With regard to the extent of surface-ground adjoining a vein or lode, and claimed for the convenient working thereof, the act provides that the lateral extent of locations of veins or lodes, made after its passage shall in no case *exceed three hundred feet on each side of the vein at the surface*, and that no such surface rights shall be limited hy any mining regulations to less than twenty-five feet on each side of the middle of the vein at the surface, except where adverse rights existing at tbe date of said act may render such limitation necessary, the end lines of such claims to be in all cases parallel to each other.

11. By the foregoing it will he perceived that no lode-claim located after the date of said act can exceed a parallelogram fifteen hundred feet in length hy six hundred feet in width, but whether surface-ground of that width can he taken, depends upon the local regulations or State or territorial laws in force in the several ming districts; and that no such local regulations or State or territorial laws shall limit a vein or lode claim to less than 1,500 feet along the course thereof, whether the location is made hy one or more persons, nor can surface rights be limited to less than fifty feet in width, unless adverse claims existing on the 10th day of May, 1872, render such lateral limitation necessary.

12. It is provided in said act that the miners of each district may make rules and regulations not in conflict with the laws of the United States, or of the State or Territory in which such districts are respectively situated, governing tbe location, manner of recording, and amount of work necessary to hold possession of a claim. It likewise requires that the location must be so distinctly marked on the ground that its houndaries may be readily traced. Thie ie a very important matter, and locators cannot exercise too much care in defining their locations at the ontset, inasmuch ae the law requires that all records of mining locations made snhsequent to ite paesage, shall contain the name or names of the locators, the date of the location, and such a *description of the claim or claims* located, hy reference to some natural object or permenent monument, as will indentify the claim.

13. The eeid act requires that uo lode claim can he recorded until after the discovery of a vein or lode within the limite of the ground claimed; the object of which provision is evidently to preveut the encumhering of the district mining records with uselese locations before sufficient work has heen done thereon to determine wbether a vein or lode has really been discovered or not.

14. The claimant should therefore, prior to recording his claim, unless the vein can be traced upon the surface, sink a shaft, or run a tunnel or drift, to a sufficient depth therein to discover and develop a mineral-hearing vein, lode, or crevice; should determine, if possible, the general couree of such vein in either direction from the point of discovery, by which direction he will he governed in marking the houndaries of his claim on the surface, and should give the course and distance ae nearly as practicable from the discovery-shaft on the claim, to some permanent, well-known points or objects, such, for instance, as stone monuments, blazed trees, the confluence of streams, point of intersection of well-known gulches, ravines, or roads, prominent buttes, hills, etc., which may be in the immediate vicinity, and which will serve to perpetuate and fix the *locus* of the claim and render it susceptihle of identification from the description thereof given in the record of locations in the district.

15. In addition to the foregoing data, the claimant should state the names of adjoining claims, or if none adjoin, the relative positions of the nearest claims; ehould drive a post or erect a monument of stones at each corner of his surface-ground, and at the point of discovery or discovery-shaft, should fix a post, stake, or board, upon which should be designated the name of tbe lode, the uame or names of the locators, the number of feet claimed, and in which direction from the point of discovery, it heing essential that the location notice filed for record, in addition to the foregoing description, ehould state whetber the entire claim of fifteen hundred feet is taken on one side of the point of discovery, or whether it is partly upon one and partly upon the other side thereof, and in the latter case, how many feet are claimed upon each side of such discovery-point.

16. Within a reesonahle time, say twenty daye after the location shall have been marked on the ground, notice thereof, accurately deecribing the claim in manner aforesaid, should be filed for record with the proper recorder of the district, who will thereupon issue the nsual certificate of location.

17. In order to hold the possessory right to a claim of fifteeu hundred feet of a vein or lode located ae aforesaid, the act requires that unitl a patent shall have been issued therefor, not less than one hundred dollars' worth of labor shall be performed or improvements made thereon during each year, in default of whicb the claim will he subject to re-location by any other party having the necessary qualifications, unless the original locator, his heirs, assigns, or legal representatives, have resumed work thereon after such failure and before such re-location.

18. Tbe importance of attending to these details in the matter of location, labor and expenditure will he the more readily perceived when it is understood that a failure to give the suhject proper attention, may invalidate the claim.

TUNNEL RIGHTS.

19. The fourth section of the act provides that where a tunnel is run for the development of a vein or lode, or for the discovery of mines, the owners of such tunnel shall have the right of possession of all veins or lodes within three thousand feet from the face of such tunnel on the line tbereof, not previously known to exist, discovered in such tunnel, to the same extent as if discovered from the surface; and locations on the line of such tunnel of veins or lodes not appearing on the surface, made by otber parties after the commencement of the tunnel, and while the same is being prosecuted with reasonable diligence, shall he invalid; but failure to prosecute tbe work on the tunnel for six months shall he considered as an abandonment of the right to all undiscovered veins or lodes on the line of said tunnel.

20. The effect of this section is simply to give the proprietors of a mining tunnel run in good faith tbe possessory right to fifteen hundred feet of any hlind lodes cut, discovered or intersected hy such tunnel, which were not previously known to exist, witbin three thousand feet from the face or point of commencement of such tunnel, and to prohibit other parties, after the commencement of the tnnnel, from prospecting for and making locations of lodes on the *line thereof* and within said distance of three thousand feet, unless such lodes appear upon the surface or were previously known to exist.

21. The term "face," as used in said section, is construed and held to mean the first working face formed in tbe tunnel, and to signify the point at which the tunnel actually enters cover, it being from this point that the three thousand feet are to be counted, upon which prospecting is prohibited as aforesaid.

22. To avail themselves of the benefits of this provision of law, the proprietore of a mining tunnel will be required, at the time they enter cover as aforesaid, to give proper notice of their tunnel location, hy erecting a snhstantial post, hoard, or monument, at the face or point of commencement thereof, upon which should he posted a good and sufficient notice, giving the names of the parties or company claiming the tunnel right; the actual or proposed course or direction of the tunnel; the hight and width thereof, and the course or distance from such face or point of commencement to some permanent well known objects in the vicinity by which to fix and determine the *locus* in manner heretofore set forth applicable to locations of veine or lodes, and at the time of posting such notice they shall, in order that miners or prospectors may he enahled to determine whether or not they are within the linee of the tunnel, establish the boundary lines thereof hy stakee or monumente placed along such liues at proper intervals, to the terminus of the three tbousand feet from tbe face or point of commencement of the tunnel, and the lines so marked will define and govern as to the specific boundariee within which prospecting for lodee not previouely known to exist is prohibited while work on tbe tunnel is being prosecuted with reasonable diligence.

23. At the time of posting notice and marking out the lines of the tunnel as aforesaid, a full and correct copy of such notice of locatiou defining the tunnel claim must be filed for record with the mining recorder of tbe district, to which notice must he attached the sworn statement or declaration of the owners, claimants, or projectors of sucb tunnel, setting forth the facts in the case; stating the amount expended by themselvee and their predecessors in interest in prosecuting work thereon; the extent of the work performed, and tbat it is *bona fide* their intention to prosecute work on the tunnel so located and described with reasonahle diligence for the development of a vein or lode, or for the discovery of mines, or hoth, as the case may be.

24. This notice of location mnst be duly recorded, and, with the said sworn statement attached, kept on the recorder's files for future reference.

25. By a compliance with the foregoing much needless difficulty will be avoided, and the way for the adjnstment of legal rights acquired in virtne of said fourth section of the act will be made mucb more easy and certain.

26. This office will take particular care that no improper advantage is taken of this provision of law by parties making or professing to make tunnel locations, ostensibly for the purpose named in the statute, hut really for the purpose of monopolizing the lands lying in front of their tunnels to tbe detriment of the mining interests and to the exclusion of *bona fide* prospectors or miners; but will hold such tunnel claimants to a strict compliance with the terms of the act; and as *reasonable diligence* on their part in prosecuting the work is one of the essential conditions of their implied contract, negligence or want of due diligence will be construed as working a forfeiture of their right to all undiscovered veins on the line of such tunnel.

MANNER OF PROCEEDING TO OBTAIN GOVERNMENT TITLE TO VEIN OR LODE CLAIMS.

27. By the sixth sectiou of said act, authority is given for granting title for mines by patent from the Government, to any person, association or corporation having the necessary qualifications as to citizenship and holding the right of possession to a claim in compliance with law.

[To be continued.]

Domestic Economy.

Rice—Its History and Value.

The use of rice as a breadstuff is probably coeval with the human race. Like that of the other cereals, it extends beyond tbe reach of record. Under the name of *oruz* in Arabic, *oruza* in Greek, *oryza* in Latin, *riz* in French, *reis* in German, *rice* in English,—it has heen known to history for two or three thousand years, heing mentioned hy Pheophratus 2,200 years ago, and by Horace, Pliny, and Celsus at a later date.

Its native place is probahly the steaming river hottoms of India, whence it traveled eastward and uorthward to China aud Japan, and westward to Egypt and to us. When it reached Egypt we know not; early enough, as many think, to give rise to that singular exhortation of the royal preacher of Israel, 2,800 years ago, in which, alluding probably to the mode of sowing rice on the swollen surface of the Nile, he says, "Cast thy hread upon the (face of the) waters: for thou shalt find it after many days," Eccles. xi. 1.

After being introduced into Italy from Greece, as we learn hy the form of the uame, and being domesticated for centuries in all the southern countriee of Europe, it was carried, in the year of 1605, to the then infant colony of Carolina, where it was cultivated to such extent, and brought to so high a degree of perfection, that the rice raised upou the southern seaboard of the American colonies, now the United States, has heen ever since known in Europe as Carolina rice.

As au article of food it surpasses in importance every other cereal in present use. Wheat may he more nutritious, rye more hardy, maize spread over a wider range of temperature—hut rice feeds the greatest number of humau mouths. Amoug the swarming millions of the tropice, and of China, it occupiee the same place as wheat in the warmer parts of tbe temperate zoue, and rye in the colder.

It has heeu estimated that, if the human race were divided into families according to tbe predominant use of the several grains, the rice eaters would occupy the first place in numher; while wheat and maize would contend for the eecond, with a fair promise of victory for the maize; and the fourth place would he held hy rye, oats, and barley. Indeed, besides heing "the staff of life" in the most populous parts of the earth, it is used so extensively among all the other grain eaters of the human race, that it ie questionable whether a greater amount of it is not consumed as a breadstuff than of all the other cereale combined.

Among the botanist rice is kuown by its Latin name, *Oryza*. There is hut one species, though there are many varieties; for the wild rice, eo called, of tbe North American ponds and lakes, is not a rice, but a reed—not an *Oryza* hut a *Zizania*.

Food chemists tells us that it contains "less of the nutritive principal than wheat." This however, is in some measure compensated hy tbe fact that of all the cereals it is the most compact—a merchantable bushel of maize or Indian corn, being rated at 56 lbs., and wheat at 60 lbe., while rice, which rarely sells hy hulk, and therefore has no estahlished standing like the othere, seldom weighs leee than 65 lbs. to the bushel, and oftentimee more. Its compactness ie shown also in ite resistance to heing crushed, having almost a gravel-like hardness, and also in the fact that skillful hoiliug will cause it to expand and donhle, perhaps trehle, its former hulk. But, however weighty in the scales, it is exceedingly light upon the stomach.

In general wholesomeness, iu delicacy of flavor, and in the variety of nses to which it is applicable, it is prohahly not surpassed by any other grain. To the strong stomach of the day lahorer it as well suited as the coarse bread of the Indian corn, rye, or oats; while for the deli-
appetite of the habe, invalid or for the ten-
organs of the it ie a safe substitute for sago, arrowroot, tapioca, or cassava.—*Food Journal.*

Salad.—Dr. Kitchiner's receipe for making a salad:—"Boil a couple of eggs for 12 minutee, and put them in a hasin of cold water for a few minutes. The yolks must be quite cold and hard, or they will not incorporate with the ingredients. Ruh them through a seive with a wooden epoon, and mix them with a tablespoonful of cream; then add two tahlespoonfuls of oil. When these are well mixed, add by degrees a teaspoonful of salt and powdered lump sugar, and the same of made mustard; when these are emoothly united, add very gradually 3 tablespooufuls of vinegar; rub it with the other ingredients till thoroughly incorporated with them; cut up the white of the egg, and garnish the top of the ealad with it. Let the sauce remain at the hottom of the howl, and do not stir up the salad until it is to be eaten." If to the above he added a teaspoonful of Tarragon vinegar, and a teaspoonful of Eschalot vinegar, a salad will be made to which none will object.

Broiling Meats.—When meats are hroiling on a gridiron over hot coals, the sndden high heat applied sears the outside, which shuts in the jnices, and rapid application of heat soon cooks the meat through, if in moderately thin piecee. It is then tender, juicy and palatahle. Those who never broil their fresh meat, fish or poultry, do not know the excellencies of a properly cooked dish of animal food.

How to Distinguish Edible Mushrooms.

Every housekeeper who makes nse of this delicious esculent, should know how hy some test, to distinguish the true mnshroom from the poisonous species. A writer in the English *Mechanic* gives what he considers an infallihle tcst for so distinguishing the good from the bad.

He remarks, in the first place tbat the true mnshroom is invariahly fonnd in rich pastures; and never on or about stumps, or in the woods, and, although a wholesome species sometimes occurs in the latter localities, the writer considers it better to avoid their products. A very good point, in the second place, is the peculiar intense purple hrown color of the spore-dust, from which the ripe mushroom derives the same color (almost black) in tbe gills. To see these spores, it is only necessary to remove the stem from the mushroom, and lay tbe upper portiou with the gills downward, ou a sheet of writing paper, when the spores will be deposited, in a dark impalpahle powder, in a short time. Several dangerous species, sometimes taken for the true, have the spore umber-brown, or pale umher-hrown.

In the true mushroom, again, there is a distinct and perfect collar, quite encircling tbe stem, a little ahove the middle, and tbe edge of the cap overlaps the gills. In some poisonous species this collar is reduced to a mere fringe, and the overlapping margin is absent or reduced to a few white scales. Lastly, the gills never reach to nor tonch the stem, there being a space all around the top of the stem, where the gills are free from the stalk.

There are numerous varieties of true mushrooms, all of them equally good for the table. Sometimes the top is white and soft as kid leather; at other times it is dark hrown and ecaly. Sometimes on heing cut or broken, the mushroom changes color to yellow, or even blood-red; at other times, no change whatever takes place. To sum up, it is to be observed that the mushroom always grows in pastures; always has dark, purple-hrown spores; always has a perfect encircling collar; and always has gills which do not touch the stem, and has a top with an overlapping edge.

In addition to the method just indicated for testing the genuinenes of mushrooms, we are informed tbat, however much any particular fungus may resemhle the eatahle mushroom, none are genuine or safe, the skin of whicb cannot be easily removed. When taken hy the thumb and finger at the overlepping edge, this skin will peel up ward to the center, all around, leaving only a small portion of the ceuter of the crown to he pared off by the knife.

The "Why" in Vegetable Cookery.

Why should Soda be boiled with greens, cabbages, brocoli and turnip greens?—Because the oil which all these vegetables contain more or less, the soda extracts, and leaves the greens swect and wholesome; hut the water is, after boiling tbe geeens with soda, most unwholesome, perbaps poisonons. A piece of soda, filhert size, is sufficient for a very large saucepan of boiling water. Turnip greens have scarcely any oil in tbem, hut are neverthelese much more wholesome for cating when cooked with a little eoda. From the secd of cabhage the colza-oil is manufactured.

Why should Vegetables be washed in rather warm water first, then in cold, to cleanse them from sand and insects?—The hot water, which must he hotter than tepid, causee the insects and sand to fall out at once. Insects do not alwaye dislike cold water and salt, but the hot water kills them. It must he understood that only a small handful of greens or one head of cabhage at a time must be washed, and then instantly thrown into the cold water, which crispe and thoroughly cleanses them. Spinach, leeks, celery and seakale, are thus rendered very clean, and, moreover, are very rapidly cleansed. It is worse than useless to attempt to cleanse vegetahles in salt and water. The hardness which salt creates in the water prevents all cleansing properties. The salt may kill the iusects (it does not always do this,) hnt they stick on hard and fast; the hot water makes them fall out at once, and the cold water crisps and also blanches them.

Why should Turnips be cut across the fibre in rings of less than half an inch in thickness?—For three reasons: first, the turnip need only be peeled very tbin, instead of in the usnal manner, thickly and wastefully; secondly, hy so cutting them the fibres are cut across, so that however old the turnip is, it is never stringy; thirdly, they require only fourteen minutes to hoil in *plenty of boiling water* and salt, and thue the delicate flavor of tbe turnip is preserved, also they can he more easily mashed. The thinner the circles of turnip are cut, the quicker they cook and the less fihre they will have.—*Mrs. Warren.*

Caution.—Housekeepers cannot be too carcful in avoiding poisonous articles and mixtures in connection with the culinary art and in other domestic arrangements. Dr. R. Mirus mentions two cases in Jena, and one in Frankfort, where persons using green glazed paper shades were attacked with symptoms of arsenic poisoning. In no case the symptoms did not cease until the use of the shade was discontinued. Tbe heat of the lamp volatilizing the areenic renders even the very small quantity present extremely dangerous. The areenic is used in the Paris green with which lamp shades, wall papers, toys, etc., are so often colored.

BURLEIGH
ROCK DRILLS
AND
AIR COMPRESSORS.
The Burleigh Rock Drills, which have stood the test of five years constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequalled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunnelling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground, or compressed air when under ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being applied.

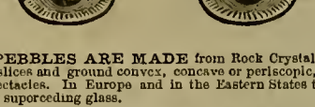
"Clear as Crystal."


PEBBLES ARE MADE from Rock Crystal cut in slices and ground convex, concave or periscopic, for Spectacles. In Europe and in the Eastern States they are superceding glass.
Among the advantages they have over glass are, that being susceptible of the HIGHEST POLISH, they transmit more rays of light, nothing having more transparency.
They are COOLER to the Eyes—a very important gain.
They are much harder than glass, and DO NOT SCRATCH.
The best quality of Crystal is found in Scotland and the Brazils, and is manufactured into lenses by the best workmen in England and France, for
Thomas Houseworth & Co.,
OPTICIANS,
No. 9 Montgomery street, Lick House,
Where they can be obtained, already fitted, in frames, or may be fitted to order.
Persons sending their Spectacles can have Pebbles inserted of the same grade as their glasses.
Illustrated Circular for style of frames sent to any address free.

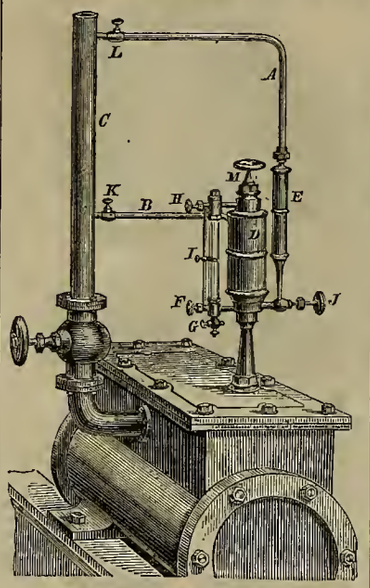
BETTS'S name is upon every Capsule he makes for the leading Merchants at home and abroad,

and he is the ONLY INVENTOR and SOLE MAKER in the United Kingdom.

MANUFACTORIES:—1, WHARF-ROAD, CITY-ROAD, LONDON, AND BORDEAUX, FRANCE.

N. Seibert's Eureka Lubricators

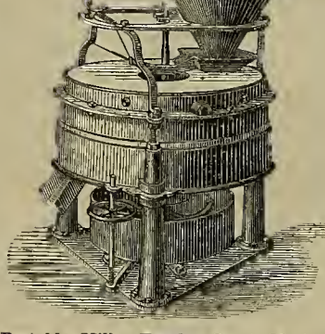


THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lnbricators are acknowledged by all engineers to he superior to any they have ever used; feed constantly hy pressure of condensed water, supplied by pipe A, regulated under the oil hy valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes gressy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gsuge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured hy California Brass Works, 125 First street, S. F. 24v23tf

MILL STONES.



Portable Mills, Eureka Smut Machinee Bran Dusters, Dufour & Co.'s Celebrated Dutch Anchor Bolting Cloths, and General Mill Furnishing.

Machinery.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco.

FOR SALE.

A 10-STAMP QUARTZ MILL,

Known as the Montezuma Mill, in Montezuma District, Nye County, Nevada.

All in running order, with Pans, Belting, Furnaces, etc. In a good locality for custom work. The mill can remain or be removed.

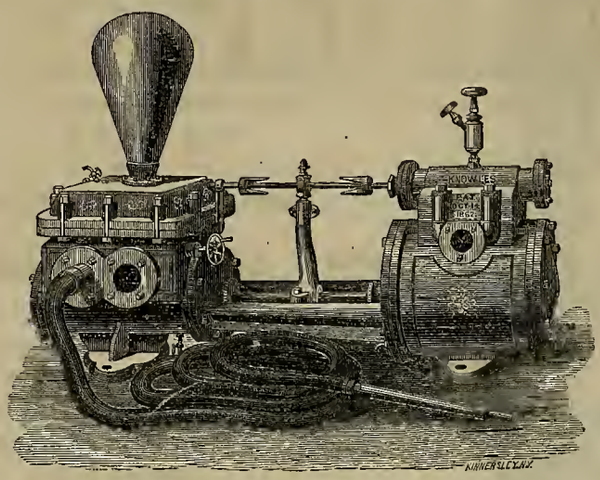
KNOWLES' PATENT STEAM PUMP.

Extract from Official Report of Mechanics' Institute Fair of San Francisco, 1871.

"In the foregoing trials it appears that the most efficient Pump on exhibition is the KNOWLES. The workmanship on this Pump is also very good. We would therefore recommend that this Pump receive a Silver Medal. (Diploma awarded). Signed by the Committee:

G. W. DICKIE, H. B. ANGELL,
CHAS. R. STEIGER, W. EPPELSHEIMER, MELVILLE ATWOOD."

v13-awbp



It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequsntly it is always ready to start without using a starting-bar, and does not require hand-work to get it past the centsr. Will always start when ths steam cylinder is filled with cold water of condensation.

The trial of Steam Pumps at the Eighth Industrial Fair in San Francisco, by a Committee of Five of the most thoroughly practical mechanics on this coast, showed the Knowles Pump to lose but 11⅛ psr cent., while others lost as high as 40 per cent., showing great differeuce in economy.

WE BUILD AND HAVE CONSTANTLY ON HAND

THE LARGEST STOCK OF PUMPS IN THE WORLD,

And for Every Conceivable Purpose.

A. L. FISH, Agent.

No 9 First Street, San Francisco, Cal.

P. S.—All kinds of new and sscond-hand Machines on hand. 3v24-eow-bp

BLAKE'S PATENT STEAM PUMP.

From the Report of the Committee on Steam Pumps, at the Seventh Industrial Exhibition of the Mechanics' Institute, San Francisco

BLAKE'S STEAM PUMP.—This Pump yielded the best results as to the quantity of water discharged as compared with its measured capacity. The valves are of brass, and well arranged. The steam valves are well arranged for operating the pumps, either fast or slow.

We recommend that a Medal be awarded to it, as THE BEST STEAM PUMP. [Awarded a SILVER MEDAL, the first premium.] (Signed) JAS. SPIERS, WM. H. BIRCH.

From the Report of the Committee on Steam Pumps, at the Eighth (or *last*) Industrial Exhibition of the Mechanics' Institute, San Francisco:

BLAKE'S MINING PUMP.—This is an excellent Pump, well made, and gives a high per cent. of duty. We recommend a Diploma for this Pump. (Signed by the Committee.)

G. W. DICKIE, H. B. ANGEL, CHAS. R. STEIGER,
W. EPPELSHEIMER, MELVILLE ATWOOD.

[No other Steam Pump received other than a Diploma or honorable mention at the LAST Mechanics' Exhibition, *all other assertions to the contrary notwithstanding*. Hooker's Hand Pump was the *only* Pump of any kind whatsoever, that received a MEDAL and FIRST PREMIUM (highest award to pumps) at the *last* Exhibition, for which we are also selling agents.—*See official Report of the above Committee.*]

The trial of Steam Pumps at the Eighth Industrial Fair in San Francisco, by a committee of five of the most thoroughly practical mechanics on this coast (as above named), showed that the Blake Pump gave 86 per cent. of utilized power, while others gave but 60 per cent., showing great difference in economy.

The Blake Pump is the ONLY Steam Pump that EVER RECEIVED A SILVER MEDAL at any Exhibition of the Mechanics' Institute ever held in San Francisco or California.

☞ A complete stock of all sizes constantly on hand at the Machinery Warehouse of the Agents,

TREADWELL & CO.,

Market Street, corner of Fremont, SAN FRANCISCO.

THE TRUTH!

A. L. FISH, Agent Knowles' Steam Pump—Dear Sir: In answer to your inquiries, we state that the highest award for Steam Pumps at the Eighth or last Mechanics' Fair in San Francisco, was a *First Premium* and Diploma, awarded to the Knowles' Patent Steam Pump, as published in the Official List September 23d, 1871.

A. S. HALLIDIE, President Board of Managers.

W. H. WILLIAMS, Sec'y Board of Managers Eighth Industrial Exhibition, M. I.

THE GIANT POWDER COMPANY

Are now manufacturing besides the famous regular

GIANT POWDER, A NO. 2 GIANT POWDER,

Somewhat slower in its Explosion, which we recommend for

BANK BLASTING, COAL MINES,

AND FOR ALL SUCH WORK WHERE THE ROCK IS NOT VERY HARD

It is fully as safs as ths other and svolvss neither smoke nor noxious fumes when exploded.

Price. 50 Cents per Pound.

The sales of both grades increase very fast, which is the best proof of their superiority over other explosives.

LEA & PERRINS'

CELEBRATED

Worcestershire Sauce.

Declared by Connoisseurs to be the only good SAUCE.

Caution Against Fraud.

The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name of "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ASK FOR LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.

Ask for LEA & PERRINS' Sauce, and see name on wrapper, label, bottle and stopper.

Wholesale and for export by the Proprietors, Worcester; Crosse & Blackwell, London, &c., &c., and by Grocers and Oilmen universally. 15v24-eow-tf

Year, Month, or Number.

DREYFUS' PATENT SELF-OILERS,

For Shafting, Engines, Machines, Etc.

Save from 75 to 95 per cent. of oil used on shafting or machinery bearings. No better investment for the amount can be made by any persou having machinery or running shafting. They are widely known for their reliability and economy. All the trouble of "oiling up" is avoided. There is no wsste of oil, and no cans are needed A single trial will prove their value. We will put them into any mill, and if not perfectly satisfactory, they may be returned at our expense, and the price will be refunded. We have a large stock on hand, of all sizes, adapted to all description of boxes. Send for Price List and Circular.

Address TREADWELL & CO.,

26v24 San Fraucisco.

PURCHASERS please say advertised in SCIENTIFIC PRESS.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and Progressive Industry.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, AUGUST 10, 1872.

VOLUME XXV. Number 6.

Academy of Sciences.

The regular meeting of the Academy of Sciences was held at their rooms on Clay street, on Monday evening last, Gen. Hewston in the chair.

Contributions.

Mr. C. B. Turrill contributed an interesting collection of human remains, fossils and minerals. Among the former were a number of Indian skulls, found near Salt Lake city, each of which gave indications that their former owners came to their death in some desperate conflict.

Gov. Sam. Purdy, thought C. D. Gibbs presented an interesting collection of minerals from Utah, embracing, principally, specimens of silver ore in the various forms in which it abounds in that Territory, representing the finest "shows" of eight different mines in the Little Cottonwood locality and elsewhere. The samples exhibited a variety of combinations and different appearances.

C. D. Gibbs presented specimens of a fresh water algae, from the tule regions. Whether for the manufacture of paper, or any other purposes the substance might be adapted, the gentleman was unable to proclaim at the immediate time. The substance had the appearance of cotton batting that had been wet and allowed to adhere closely in drying.

Mr. Stearns presented a specimen of the truncatella stimsonii with a description. This is a newly discovered shell which abounds on the shores of False Bay, near San Diego; numerous specimens having been there detected by Henry Hemphill, our worthy California naturalist. The truncatella stimsonii has an average length of 22-100 of an inch, and differs from the truncatella Californica, heretofore familliarly known by the absence of surrounding bands and various peculiarities of form.

The same gentleman also regretted to announce to the Academy the death of Major Sidney S. Lyon, the distinguished geologist, at his home in Jeffersonville, Indiana. His death resulted from paralysis, produced by a wound received in the gallant defense of his country in the late war for the Union. Major Lyon was associated with Professor Owen and other eminent scientists of the East. He has visited this coast and become personally acquainted with different members of the Academy. One of his works evincing distinguished ability was the Geological Survey of the State of Kentucky.

Something to be Looked to.

Dr. Blake called the attention of the Academy to a new blight that had recently made its appearance in the Sacramento Valley, attacking the peaches and nectarines. A full-grown peach was exhibited by the gentleman, about two-thirds coated with a green mould, underneath which the substance was rotted and unpalatable. The Doctor had not observed it on the grape as yet; but expected to hear of its attacking that fruit. Never saw it on any fruit west of Sacramento. This blight was liable to become a serious detriment to our fruit-growers, particularly if extended to the vineyards.

Dr. Gibbons inquired of Dr. Blake if he was aware of any evidence of the introduction of foreign pests or blights into the United States during the last half century, and whether the fruit blight in question was of foreign origin. He had supposed that every blight that could be introduced had already appeared in the Atlantic States.

Dr. Blake could only reply that some species of thistle and blight had been introduced within that period, as he believed.

A Rare Mineral.

Dr. Blake presented a specimen of a rare mineral that existed in some part of the State of Nevada. He had received it from a person who conceived that it was a material of great value, and who declined to designate the precise locality of its existence. He had found the mineral to be a pure form of titanic acid. It was a little remarkable as a singular formation, but he, Dr. Blake, believed that it had no commercial value or utility.

Coming.

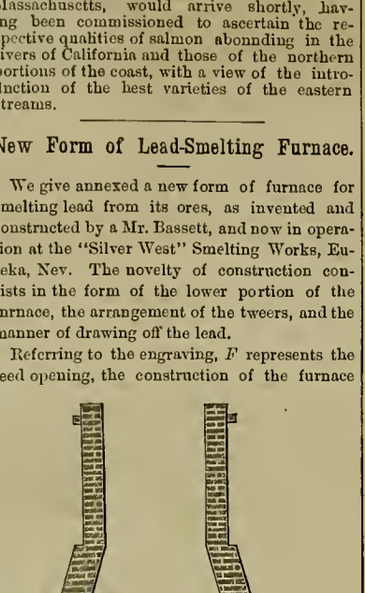
Dr. Gibbons was pleased to announce to the Academy that Professor Torry, the distinguished botanist of New York State, was on his way hither, accompanied by a portion of his family.

It was also announced by a member that Professor Livingston Stone, of the State of Massachusetts, would arrive shortly, having been commissioned to ascertain the respective qualities of salmon abounding in the rivers of California and those of the northern portions of the coast, with a view of the introduction of the best varieties of the eastern streams.

New Form of Lead-Smelting Furnace.

We give annexed a new form of furnace for smelting lead from its ores, as invented and constructed by a Mr. Bassett, and now in operation at the "Silver West" Smelting Works, Eureka, Nev. The novelty of construction consists in the form of the lower portion of the furnace, the arrangement of the tweers, and the manner of drawing off the lead.

Referring to the engraving, *F* represents the feed opening, the construction of the furnace



BASSETT'S NEW LEAD SMELTING FURNACE.

above said opening being such that an eddy must be formed just above it, so that the heavy dust from the ore must fall back on the charge, and not pass out from the top of the chimney and go to waste, as is the case in many furnaces.

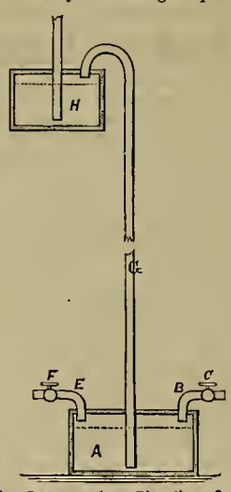
From near the bottom of the hearth of the furnace, at *H*, an opening, *A*, inclines upwards, allowing the lead, as fast as it makes, to find its way to the outside, into the pot, *C*, from which it is conveniently removed. Just above the tweers, *D D*, is an offset, *B B*, at right angles with the walls of the furnace, the object of which is to give greater working capacity to each tweer, and also to make the ore and coal form a lining for the lower portion of the furnace walls. It is claimed that when the blast leaves the nozzles of the tweers it breaks against the charge of ore and coal, and rushes back to the wall above the offset with nearly as much force as that with which it goes to the centre of the furnace; by which means it gives fifteen inches more working space over each tweer than by any other mode of furnace construction.

This furnace has 14 tweers, and each one is expected to reduce six tons of ore every twenty-four hours. A strata of half smelted ore will always lay next to the walls of the furnace, out of the reach of the smelting heat, by which the walls will be protected from the force of the blast and heat, and whereby a furnace, built of ordinary bricks, may be made to last one year under continuous blast.

This is the first furnace that has been built after the above described plan, as regards proportions. The syphon top is claimed and used by other parties, but the deep offset in the walls of the furnace is supposed to be original with Mr. Bassett.

Improved Process for Elevating Quicksilver in Quartz Mills.

One of the laborious and inconvenient tasks in carrying on the process of amalgamating the precious metals in mining operations is the frequent necessity of handling the quicksilver in



Hofmann's Process for Elevating Quicksilver.

bulk, especially in transferring it from the settlers to the amalgamation pans. To obviate this difficulty, Mr. Ottakar Hofmann of Ellsworth, Nye county, Nevada, has devised the following described invention, by which this labor is simply and readily performed by the pressure of steam, or by means of a vacuum. The process by which this is done will be readily understood by referring to the accompanying illustration.

A, represents a closed iron tank or vessel into which the quicksilver is admitted through a pipe, *B*, until the tank is almost filled, when the cock, *C*, is closed so as to cut off communication through the pipe, *B*.

E is a steam pipe which communicates with the tank which is also provided with a cock, *F*. *G* is a vertical pipe which passes down through the top of the tank, *A*, and terminates near the bottom. This pipe extends upward and communicates with another tank, *H*, or with a pan, as the case may be.

After the quicksilver has been admitted into the tank, *A*, and the cock, *C*, has been closed, the cock, *F*, is opened and steam forced into the tank until a sufficient pressure is obtained to drive the quicksilver up into the upper tank, *H*. If necessary, the tank, *H*, can also be made air-tight, and another pipe similar to *G*, led from it up into another tank above, as shown.

Instead of a pressure in the vessel, *A*, a vacuum could be produced in the upper tank, *H*, and the quicksilver drawn up in the same manner. By this means we avoid the necessity of lifting the quicksilver physically and carrying it from the settlers to the pans.

A patent for the above invention has been secured through the Scientific Press Patent Agency.

New Quicksilver Assay.

The *Berg. u. Huett. Zeitung* describes a new method of assaying quicksilver ores, which has been discovered by A. Eschka, Assayer at the General Assay Office in Vienna.

For assay sample different amounts are taken according to the richness of the ore. Up to 1 per cent. quicksilver, 10 grammes are taken; with 1 to 10 per cent., 5 grammes; 10 to 30 per cent., 2 grammes; over 30 per cent., 1 gramme.

The sample is mixed with about one-half its weight of pure iron filings, put into a porcelain crucible with a thin covering (¼ to 1 cm.) of filings, and covered over with a concave cover of fine gold, 5 cm. in diameter, 12 to 15 grammes, and having a border which fits closely to the crucible. The cavity in the cover is filled with distilled water, and the crucible is heated for 10 minutes over a gas flame or a strong spirit flame.

The quicksilver is volatilized and fastens on the gold coin. This is removed, the water poured off, the quicksilver on the convex side washed off with alcohol (from a wash bottle), dried in a water bath and, after getting fully cold, weighed. The gold cover is laid on a porcelain crucible and weighed also, after the cover has been heated (to drive off the quicksilver) it and the empty crucible are again weighed for security.

The following conditions are necessary for the success of the assay:—A well fitting cover, in order to avoid loss of mercury, and sufficient depth to hold a proper amount of water to keep it cool; filings free from fatty substances, which interfere with the quicksilver coating; washing with alcohol in order to get rid of bituminous matter and to hasten the drying; drying in 2 or 3 minutes; cooling and weighing only when quite cold; collecting the wash alcohol and, if it contains any quicksilver, obtaining this by pouring it upon the cover. The most exact results are obtained with poorer ores holding up to 10 per cent. mercury.

Railway Speed.—Fifty and sixty miles an hour for railway travel is oftener talked about than realized. A speed of sixty miles an hour for a regular passenger train has never been attempted, except in one instance, and that on a wide 7-foot gauge in England. This rapid speed pleased travellers very much, and many willingly paid the large extra charge for being shot along over the ground at a rate so great as to render the way stations of the accommodation trains almost invisible. But the railway company soon found they had passed the practicable limit of the endurance of wood and iron. They found that the "wear and tear" induced upon both road and rolling stock by such excessive speed, was also beyond the endurance of *finance*, and that high rate of speed was consequently abandoned.

There are but few trains now running on the best wide-gauge, straight roads in England, which average a speed of fifty miles an hour. The express passenger traffic is usually done at the rate of 35 to 40 miles, while the ordinary travel is about 22.

Railroad travel in this country is much slower, and necessarily so in consequence of the lack of solidity in our roads and rolling stock. Our "lightning trains" scarcely reach, and very seldom exceed, 35 miles an hour—in fact our fast trains do not average over 30 miles, while our general passenger traffic does not exceed an average of 20. Freight trains usually run about 16 to 18 miles an hour.

CORRESPONDENCE.

Notes of Travel in White Pine County, Nevada—Continued.

[By our Traveling Correspondent.]

Treasure City.

In my last I mentioned the elevatiou of this place, hut neglected to state that it was situated at a higher elevation than any city or town in the United States, and second highest in the world. It contains ahout 800 inhahitants, and lies 2 miles south of Hamilton. The "Miners' Union" have their headqnarters at this place, for "White Pine District," and numher over 400 memhers; the follcwing are the present officers of the same: President, John White; Vice-President, Henry Kames; Recording Secretary, John Lovelle; Financial Secretary, Chas. Davy; Corresponding Secretary, G. H. Baldy; Treasurer, H. L. Becker; Conductor, Wm. Ormond; Warden, John Dougherty; Finance Committee, Martin Igo, Stephen Whitford, J. C. Edwards. The principle mines in this section as far as developed, are as follows, first in order being the oldest location. The

Original Hidden Trsasurs

Was located in November, 1867. It is an incorporation, owning 800 feet of the heart of "Treasure Hill," divided into 21,333 shares, Wm. B. Bourne President; D. A. Jennings, Secretary; Capt. Wm. Boyle, Superintendent; the Trustees are Roht. Sherwood, A. Hayward, Jos. De la Montanya, John Crocker, S. Pinkham and Walter Laidlow. This company's mines are located on the northern hrow of Treasure Hill. The original owners made a fortune out of the Original Hidden Treasure hefore selling to the present incorporation, hy crushing its rich ores found on the surfacs. The Rathhurn mine was purchased by this company and consolidated with the same. This mine has had an eventful history, heing "Bulled and Beared," paid dividends, and levied assessments hy turns. It is certainly the richest mine on this hill, and nnder its present management, if not interfered with for the next 60 days, will prove so.

The Wheeler Tunnel,

Belonging to this company, is now in ahout 315 feet, and from the present indications will strike the main ore hody inside of 30 feet. Should they find the ore of paying quality, and quantity in this tunnel, a perfect furore in this stock is imminent, for it will not only prove that they have 600 feet of ore ahove them (the distance to the top) hnt will settle the question with all the other mines on this hill, that the main hodies of ore are deep down. This company are at present working 65 men. They also own what is kuown as the

Big Smoky Mill,

Which is kept constantly running on the ores taken from their mines. It is located in the suhurhs of Hamilton, has 20 stamps with a reducing capacity of 20 to 22 tons of ore per day (24 hours), run hy steam. Springs belonging to the company furnish them with free water, a big item here. Next in order is the

Pennsylvania Mine,

Located in June, 1868 and emhraces 400 feet on the great ore belt of Treasure Hill; it joins the Hidden Treasure on the south. Incorporated capital stock $2,000,000, in 20,000 shares. Office 415 Montgomery street, San Francisco. Rohert Sherwood is President, and the Trustees are A. Haywood, Andrew Jackson, G. W. Cope. D. L. McDonald, J. G. Messic and Jasper O'Farrel; the Secretary is Frank Swift; and Wm. Boyle is Superintendent.

The present working consists of two shafts, one down 40 feet, rigorously worked day and night. At ahout 20 feet more depth, ore will certainly he found, from indications. Working regularly 6 men. The next below is the

East Sheboygan Mining Co.—(Limited),

Head quarters, London, England; 47,500 shares; £2 par value; commenced work one year ago. Tunnels and shafts explore the ground 300 feet in length, and 141 feet in depth. Ore found the whole length of present works. The vein varies from 4 to 15 feet in thickness, and the ore runs from $25 to $45 per ton. The mine is situated ½ mile north of the O. H. Treasure.

The Silver Glance, belonging to the same company, is situated 1,500 feet southeast of the Eherhardt mines. It has heen worked since the commencement of the present year. The present works are carried on for the purpose of fully developiug the property. The ore hody so far as discovered, is 200 feet in length, and 15 feet thick; average grade, $35 per ton. The superintendent of the Company's property, is William Rogers, of London; A. J. Brown, resident superintendent. Next ahove the O. H. Treasure, is the

Noonday,

Located on "Bromide Flat," ahout 1,000 feet west of the North Aurora. Has its main shaft down about 120 feet; at this depth a large body of low grade ore was found. A drift in the easterly direction from the ore chamber at the hotton of this shaft, has heen run 200 feet; low grade ore appears throughout its entire length. This mine is situated on one of the "transverse hreaks" of the hill. The drift above mentioned, is run on the south line of the hreak. Two shifts of men are now engaged in driving a cross-cut through the ledge to the north. Several men are also engaged in the surface works of the mine from which good ore is heing extracted. The mine promises well for ths future; 7 men regularly employed. This is an incorporation with a capital of $2,000,000, in 20,000 shares, O. H. Bogart, President, Chas. H. Fish, Secretary, and H. A. Woodman, Superintendent.

Ward Beecher Cona. M. & M. Co.

This Company is an incorporation with a capital stock of $2,400,000, in 24,000 shares; W. B. Bonrne, Pres.; D. A. Jennings, Sec'y; B. T. Snell, Sup't; Board of Trustees: Rob't Sherwood, C. B. Land, Alvinza Hayward, W. B. Bourne, J. W. Gashwiler, Jos. De la Montanya and H. G. Blasdel. Office, 401 California street, S. F. This Company's claims are located on Treasure Hill, adjoining the Eherhardt & Aurora S. M. Co.'s property on the north, and south of the Anderson claim. Their improvements and developments consist of a verticle shaft 116 feet dsep, (known as the north shaft); one drift west 90 feet to the ledge; and a drift north along the wall 90 feet in ore; hoisting hy whim; a tunnel 300 feet long extends to this shaft. Their south shaft is down 50 feet vertically to the foot wall, which dips to the east at an angle of about $38°$, hreasting out from that point east; now in from foot of incline 80 feet in ore. Two other shafts are sunk upon this mine hetween the north and south shafts, to a depth of 112 and 65 feet. Ore is struck in both and improving; working 65 men night and day. The mill known as the Manhattan, located 1¼ miles north of Hamilton, is the property of this Company, and is kept constantly at work on the ores of the Ward Beecher Cons. M. & M. Co.'s mines. The mill has 24 stamps, with 8 large settlers, 16 pans and all the improvements necessary to rnn a mill of such capacity; run hy a steam engine of 65 horse power; it has four boilers, and has a capacity of reducing 30 tons every 24 honrs; not fairly under way at this writing; working 16 men; Dr. E. S. Gabh is Snperintendent of the mill. Every convenience, including a pay office, hoarding house, etc., with out-hnildings is attached. Average assay of this company's rock for the last 20 days was about $45 per tou.

The Mukwanago Mining Co

Situated on Treasnre Hill, White Pine, have secured United States Patents to the "Golden" and "Monnt Vernon" fissure veins. Their patents extend from the North Aurora east line across the Hill. These surveys are together 600 feet north and sonth, hy 800 feet east and west, and cross two important chamhers of ore, crossing the Hill at right angles. The Mount Vernon vein fissure can be easily traced from the Aurora ore chamher, to the summit of the Hill, and at all points where it had hsen explored good ore is found. The Golden fissnre line, is in every respect similar in character to the Mount Vernon.

All the ore chambers on Treasure Hill have an nnderlie to the east, and the North Aurora must in time he worked through the patent survey of the Mukwauago Co's. mines.

The ahove company is incorporated in Chicago, with a Capital Stock of $500,000, divided in shares of $100 each—D. T. Elmore is agent.

South Aurora Mine.

The South Aurora mine is located at the south end of the crest of Treasure Hill, hetween the North Aurora and Eberhardt mines, and is incorporated in England and owned hy the South Aurora Silver Mining Company (Limited); 60,000 shares of $5 each. The claim, or mine, is secured by a United States patent which covers 800 feet in length, measured in a north and sonth direction along the course of the ore deposits by 300 feet in width. This Co. also own 400 feet of the South Icebsrg, the North Snow-Drop and Genesee, adjoining the South Aurora on the west.

Products of mine to date, July 17th, 1872.—Ore extracted and milled, 23,000 tons. Bullion produced, $820,000.

DEAD WORK.—Over 4,000 feet of shafts, tunnels, winzes, etc., and costing from $65,000 to $75,000.

Most of the ore was taken from surface openings extending down to ahout 100 feet, below which there has been hut little ore found.

The lowest level in this mine called the Satterthwaite tunnel, the excavation including the tunnel, side or cross drifts and shafts sunk helow this level, aggregate 1,120 feet, all in limestone.

From this level the company are now commencing to prospect with the diamond drill. And there are now sunk three holes respectively 100, 105 and 106 feet deep. Expect to reach a depth of 600 to 700 feet from this point or near 1,000 feet from the surface. Much delay and disappointment has heen occasionsd by a failure on the part of the agents of the diamond drill Company to furnish drill rods.

The Stanford Mill

Is owned hy this company, and is one of the best in that part of the State. It contains a rock hreaker, thirty stamps weighing 750 pounds each, sixteen amalgamating pans, eight separators and four agitators, four retorts and two furnaces for melting hullion.

The driving power is a steam engine twenty inches diameter of cylinder hy thirty-six inches thick, to which steam is supplied by three boilers, each sixteen feet long, fifty-two inches in diameter, with fifty-one three-inch tubes, consuming six cords of wood per day. The capacity of the mill is from fifty to sixty tons daily. Located at Ebsrhardt about two and one-quarter miles from mine. In the workiug of the South Aurora mine no unnecessary lahor has been performed either in the mine, or on the surface. Officers of this company are, President, E. Satterthwaite; Secretary, Chas. Cadogan. Office, 54 Old Broad street, London., Eng.

Bullion produced hy South Aurora mine since heing purchased hy the South Aurora S. Mining Co. of London, England, up to July 1st, 1872, $371,514.20; expenditnre including all deadwork, $307,109.30; halance $64,404.60.

Ths San Juan Del Rio Mining Company.

This company own three ledges, the San Juan Del Rio, the Rio Jansiro and the Castro; they own 1,000 feet on each ledge; the mines are located on the south spur of Treasure Hill, or Mahogany Cañon; a high grade of ore is found in the San Juan Del Rio, which gives indications of heing a fissure vein. The incline sunk on the ledge is 55 feet deep and the ore hody increasing. The company propose sinking 100 feet hefore stoping; there is 70 tons of ore out, working 6 men; sinking by contract. Incorporated with capital stock of $4,800,000 in 48,000 shares; Jno. H. Dwinelle, President; Trustees:-John E. Mager; Jasper O'Farrsl, C. W. Cook, J. M. Johnson; Treasurer, C. W. Cook; Theodore Cook, Secretary. Office 331 Montgomery street. Wm. Boyle, Snperintendent.

Hamilton Mill & Mining Co.

Mines situated on Treasure Hill, mill and property situated in Hamilton, White Pine county. Capital stock 500,000; Col. Jeremiah Miller, agent.

The Pogonip Mins

Was located January 4th, 1868. It is situated ou Pleasant Valley helt, now known as Pogonip Flat, on Treasnre Hill, about 1,000 yards southwest from the South Aurora mine. It runs 800 feet north and 800 fest south, with three shafts varying from 40 to 60 feet in depth, and tunnel running northeast 80 feet, with open cuts and inclines; $40 to $60 ore in sight, in hoth shaft and tunnel.

The Othello Mine,

Adjoining the Pogonip, on the southwest, located, Decemher 14th, 1868, running 400 feet each way from point of location with shafts and open work done. Ore dipping northeast, and good ore in sight.

Charter Oak Mine,

Situated ahout 300 hundred yards northeast from the O. H. Treasure mines, east side Treasure Hill. Located July 13th, 1868; running 600 feet northerly, and 600 feet southerly, with shaft 47 feet in depth, and tunnel 900 feet running southwest; $35 and $50 rock in sight. Working from 8 to 12 men.

The Milt and Office

Are on Mill street, Hamilton. The mill, which crushes dry, has 10 stamps, new and complete, with all the late improvements of pulp conveyors, elevators, etc. There are six pans, three settlers, one agitator and retort. The engine is 75-horse power. The mill is centrally located. The spring from which the supply of water is had, is 500 yards northeast of the mill.

Lumber Interests.

Lumher commands, common, $70@$80 per M.; Clear, Truckee, $160 per M. Hendric & Co., one of the principle firms here, manage to dispose of 1,000,000 feet, annually; the principal portion of which is manufactured hy themselves. They own two sawmills about seventy miles east of Hamilton on the east side of Steptoe Valley, in the Schell Creek Range; this valley of Duck Creek is settled up already with 11 farms, and over 100 families now occupy it. This district is well watered and heavily timhered, only one of the mills (the Steptos) is now running; run by steam, working 11 men; average 5,000 feet daily.

Russel & Comins are also dealers in lumher and huilding material in Hamilton. Among the three dealerf ahout 1,200.000 feet are disposed of annually. L. P. MC.

Artesian Wells in Idaho.

We see by the Idaho Press, that artesian wells are to be resorted to in that Territory, for irrigation purposes, and supply of water for the towns. The valleys and plains of that Territory are well suited to agricultural purposes in every respect except a supply of water—the spring rains and melting of the snows are all they have to depend upon for the season. With water, the plains would "blossom like the rose," and the soil produce an abnndance of grain, grass and vegetables. The soil of the large valleys that are so destitute during the hot summer months is really better than that of Utah—which is so well adapted to agricnlture when properly irrigated. The Idaho basins with plenty of water wonld yield fine fruits, and produce the best varieties, and in great abnndance. Some experiments have been made hy enterprising parties who have located small farms where they could supply themselves with water from a river or large springs—and the resnlt has been satisfactory.

The citizens of Boise City have been devoting their attention within a few weeks to this artesian well system—they have experienced some tronhle and drawhacks from employing incompetent men, and pnt to considerable nnnecessary expense. The *Standard* gives the citizens a piece of advice to this effect: "Try it again and snceeed, and thus get back the money now apparently thrown away. It is your only chance to get even."

The Qneen river valley and all the valleys north of Snake river, are rich in soil and climate, and with plenty of water wonld make fine farming lands, and afford pleasant homes to tho agricultural citizens of Idaho. Several wells have heen dug in all these valleys aud water is nsually obtained at 20 or 30 feet helow the snrface.

The Artesian Well company now operating at Boise do not seem to nnderstand the process of drilling, whereat the press of that city advise them "not to get the cart before the horse so often." No doubt the successful sinking of the wells and a bountiful supply of water will yet reward the labors that are now being made nnder difficnlties.

SMELTING WORKS WANTED.—The Inyo *Independent* wants capitalists to put np extensive smelting works at Cottonwood, on the west beach of Owens Lake. Works at that point would be accessible to the Cerro Gordo mines as well as others in the county, and near it, from Coso on the south to Wancoba, and other places east of the Inyo range, and west, along the foot of the Sierras; north, perhaps to Benton. Such an establishment, the *Independent* thinks, wonld pay handsomely and get all the ore it wanted to work and all the bullion it conld refine. A sawmill, and flume eight miles long would have to he constructed, down which to run wood and lumher to the lake.

CHEAP RAILROAD FARES FOR WORKINGMEN.—An improvement is on foot in Boston, headed hy the Hon. Josiah Quincy, requiring the railroads centering in that city to attach daily second-class cars, at one-third of the usual rates, to at least two trains entering the city in the morning and two leaving at night. In London the railways are reqnired to run trains morning and evening ten miles for a fare not exceeding two cents a trip. The question of cheap fares and depot transit is one which demands the consideration of all great centres of population, trade, and manufactures.

SCIENTIFIC PROGRESS.

The Theory of Fermentation.

Is fermentation a process of Life or of Death? Liebig holds that it is a phenomenon connected with death, and that all substances, and especially those which are albuminoid, as albumen, fibrin, casein; or, liquids, as blood and milk, have the property in the presence of air of initiating such movements in the molecules of organic bodies as to cause them to take on new forms. According to Pasteur all fermentations are processes connected with life, and fermentable matter never undergoes fermentation without an incessant interchange of molecules between it and living cells, which grow or multiply in assimilating a portion of the fermentable matter itself.

In the souring of wine, M. Pasteur holds that a growth which he calls *Mycoderma Aceti*, forms on the surface of the liquid. This little microscopic vegetable, he says, has the power of condensing the oxygen of the air after the fashion of platinum black, or of blood globules, and conveying it to the liquid on which it rests. Liebig denies this, saying that alcohol diluted with water does not contain the elements for the formation of the *Mycoderma Aceti*, and yet it is convertible into vinegar. Pasteur replies that the water used to dilute the alcohol contains everything necessary for the development of the vegetable, and reasserts the truth of his theory, adding that if the vessels in which acetification of alcoholic solutions occurs (as in wine and beer making) are steamed or filled with boiling water for a sufficient time, vinegar will not again form; at least not until a new crop of *Mycoderma Aceti* has been produced.

Comets and Their Tails.

In discussing these erratic bodies Professor Zöllner starts with the fact that fluids as water, mercury, and solids of nearly all kinds, give off vapor of low tension, though in too small a quantity to be recognized by any tests with which we are at present acquainted. It therefore follows that the masses of matter scattered throughout space are ultimately surrounded with an atmosphere of their own vapor. If the volume of such masses is too small to exert sufficient attractive force to retain this vapor, the whole mass ultimately assumes the vaporous state. Professor Zöllner thinks the many of the small comets are such masses of vapor, while others are fluid, consisting of water or perhaps of liquid hydrocarbons, an idea which is fortified by the character of the spectra of certain nebulæ as well as of some of the smaller comets.

Regarding the self-luminosity of comets and the formation of their trains, Professor Zöllner says, there are but two causes which can produce the first of these results, viz., elevation of temperature and electric action. Setting the first aside as being utterly inadequate under the circumstances, the author thinks that the electricity developed by the solar rays, either in the process of evaporation or by the mechanical and molecular disturbances they produce, is simply sufficient to cause the luminosity and also to form the train. The explanation here given of the formation of the tails or trains of comets is exceedingly ingenious, for it not only applies to those instances in which the train is directed from the sun, acting under these circumstances by repulsion, but it also accounts for the fact that in some instances the tail is directed toward the sun, there being under these circumstances electrical attraction instead of repulsion.—*Scribner.*

SEELEY'S "EXTRACT OF HOPS."—"Within a recent period Prof. Charles A. Seely, a well-known chemist of New York, has patented a method of manufacturing the extract of hops, by the use of which the hop is greatly economized. Several experimental brewings have been made in this city, which have demonstrated that the use of the extract gives a gain of from ten to fifteen per cent. over that obtained by the use of the crude hop. Here is an improvement that promises to open a new and extensive business."

This item refers to an invention involving the very remarkable and unexpected observation, first made by Prof. Seely, that "gasoline," or rather the petroleum hydrocarbons that distil below 120 deg. F., dissolve out the whole medicinal virtue of the hop, with none of the useless matter. This extract is far superior to the hop itself. We are told that thousands of barrels of beer, instead of mere experimental brewings, have now been made with it, and highly approved of by skilled experts.—*Gaslight Journal.*

THE SIGNAL SERVICE weather reports, which were only intended originally for the benefit of commerce, have proved so useful to the agricultural interest of the country also, that Congress has authorized the War Department to extend the working of the system so as to provide specially for these interests by the collection of reports from various points in the interior.

Astronomical Researches.

One of the most interesting results of the recent investigations of astronomers, is that which tends to show that the sun is really about four millions of miles nearer the earth than is stated in the text books, the latter statement being based on the observations of the transits of the planet Venus. These transits generally happen in pairs, and with an interval of eight years between each pair—a period of 105 or 122 years intervening between the last of one pair and the first of the next. The last pair of transits occurred in 1761 and 1769. The next transit, and the one towards which much attention is now being turned, will occur in 1874, and its co-transit in 1882. The distances of the earth and planets from the sun are determined by their transits.

Within the last few years, there has been a most rigorous application of the theory of attraction of the motion of the earth, Venus and Mars, as defined by the latest and most reliable observations. The theory of the earth, following this, contains a result which shows a diminution of the assumed distance of the earth from the sun very nearly to the same amount assigned by similar researches connected with the moon. The earth's mass, as referred to the sun's, would, from the same cause, require increasing to the extent of nearly a tenth part of the whole.

From the character of these statements, it is scarcely to be doubted that every possible use will be made of that rare and remarkable event—the approaching transit of Venus—to improve the present state of knowledge in regard to the sun's distance. To this end, all the resources of modern science, and all the facilities of modern enterprise, will unquestionably be combined.

Hydro-Electric Cables.

The journal *Les Mondes* which often holds forth upon marvels, has noticed a new one in a recent number. This is a proposed system for submarine telegraphic communication by means of a tube filled with water. The invention is due to M. Ferdinand Tommasi, and models are exhibited at 49 Avenue de l'Alma. The tube is of copper 1-16 of an inch in diameter. The experiment is made with a length of 3,280 feet, and the inventor hopes to obtain, first, a speed of transmission of at least 600 signals a minute, even through a length of 1,000 miles; second, a simultaneous exchange of correspondence—that is to say, the facility of being able, by the same tube, to signal both ways at once; third, the facility for printing dispatches; and fourth, a very small cost of construction.

The thread of water is in communication at each end with two pistons of the same diameter. One of these pistons is lightly pressed, and the motion is immediately transferred to the other piston. The tube and its pistons are in connection with an electro-magnetic apparatus to facilitate the transmisson and the reception of messages.

BURNING THE DIAMOND.—It is well known to many that Newton made a most wonderful prediction respecting the diamond; his powerful mind, antedating the discoveries of modern chemistry, pronounced it to be an unctuous or combustible substance. We now know that the diamond, beautifully transparent, highly refractive as it is, is identical in its composition with charcoal, graphite, or plumbago. Yet it will not burn in ordinary air, the oxygen is too much diluted by the nitrogen; its atoms are too few in number to carry on an effective attack, but when the atmospheric air is concentrated into an atmosphere of approximately pure oxygen, each of the atomic projectiles is assisted by its neighbor, and as it strikes the surface of the diamond its motion of translation is arrested, and converted into the motion which we term heat; and the heat thus produced is so intense that the crystalline carbon is kept at nearly a white heat, so that the atoms of carbon and those of oxygen unite, and carbonic acid gas is produced. To burn a diamond the operator holds the gem in a loop of platinum wire, and first heats it to redness in a hydrogen flame, and then plunging it into a jar containing oxygen, when the pale glow at once assumes a greatly increased brightness, which is kept up until the diamond is either removed or entirely consumed.

Faraday describes the combustion of the diamond in oxygen, the necessary initial temperature having been derived from the rays of the sun. The experiment is described in the admirable life and letters of Faraday by Dr. Benco Jones.

SCIENTIFIC PHENOMENA.—A very remarkable discovery made by Professor Huggins, the celebrated astronomer and spectroscopist of England, reveals the fact that the atmosphere of the distant planet, Herschell, is composed entirely of hydrogen (gas). This wonderful announcement, will overturn many of the notions which have heretofore obtained with regard to the condition of the non distant orbs connected with our solar system. From the nature of the case, the inhabitants of that far-off world, if there are any, must live without fire, as any one spark of combustion would burn everything and explode the whole concern. Truly, science is bringing matters to light, which throw all ancient wonders in the shade, and we are fortunate in living in such a progressive age.

MECHANICAL PROGRESS.

Iron vs. Steel.

Some interesting practical experiments have recently been made at the works of Macpherson, Willard & Co., at Bordentown, N. J., which are referred to at considerable length by the *Register* published at that place. It appears that the firm above mentioned have some heavy iron contracts for the bridge across the Mississippi at St. Louis. So much depended upon the strength of the materials called for that it was determined to thoroughly test the tensity strength of all the important portions of the work furnished. To do this an enormous hydraulic pulling machine, capable of exerting a power of from three to four hundred tons was constructed. Thirty-two iron shafts, about forty feet long and weighing two tons each, were first tested with a strain of 300 tons, without stretching a hair's breadth—showing the theoretic strength throughout their entire length of perfectly sound iron.

Several steel shafts, from which much more was expected, were next submitted to the test, but with a very unexpected result. Many of the steel shafts snapped under strains, in some cases even less than those which the iron ones stood perfectly, and so great became the distrust of them that the forge was ordered to proceed with more iron ones to take the place of steel, and have now furnished nearly a hundred without a single failure.

These results also emphasize if they do not inaugurate a tendency in the engineering world to return from steel to iron when employed in large masses. We have long known all about steel in small sections, but till recently no large masses of steel could be produced, and this series of tests is the first instance on record of attempts to ascertain whether the known laws of strength of small sections hold good in large masses of either wrought iron or steel.

A practical comparison of the two metals was made two years ago on the Camden and Amboy Railroad boat, "Red Jacket," with its two screws—the shafts being of equal size, one steel, one iron. The steel one twisted off in a week, while the two iron ones (one now replacing steel), both made here, have been running ever since.

What the difficulty is with steel in the large mass is not clear, but the long list of failures of steel guns confirms the facts. Krupp, the great Prussian steel maker, has already abandoned the solid forged steel gun. The matter is exciting considerable interest in the engineering fraternity and journals, and in practice, for large masses, there is a probable return for the present to the old-fashioned wrought-iron in vogue ever since the days of Tubal Cain.

Silvered Steel Cutlery.

According to the London *Mechanics' Magazine*, Mr. Neil, of London, has devised a process for so thoroughly uniting silver with cutlery as to produce an article of great practical value. It has long been the custom to electroplate silver on steel; but whenever the external coating is ground off the steel is exposed, and thereby rendered liable to rust. In the present instance the knives are finished in the finest style, and chemically cleaned by a special process. They are then treated with perfectly pure silver, and the two are pressed together by processes which are not made known by the inventor. It asserted that the silver is driven into the pores of the steel, and that heat and moisture have no perceptible effect on the metals. The result is a knife that will not rust, is not stained by acids, and only requires washing after use. It may be sharpened any number of times, with the result of always showing a silver surface.

PLASTER AS A PROTECTION FROM FIRE.—After the conflagration in Paris, it was generally found, that with good plaster work over them, beams and columns of wood were entirely protected from the fire. In cases where limestone walls had been utterly ruined on the outside by the flames passing through the window openings, the same walls, internally escaped almost unscathed, owing to their being coated with plaster.

On many such plastered walls the distemper decorations were still to be made out. The iron roofs rendered good service, and the party walls of each house were carried up right through the roof—a most important precaution, for otherwise nothing could have prevented the disastrous conflagration from being more extensive than it was. It was also found that good woodwork in beams and posts, good wood floors, well 'pugged, and good wooden staircases, were safer and more to be depended upon than cast iron columns and stone staircases, landings and floors. Stone staircases well protected by plaster were fireproof, although not so safe as wood in case of heavy *debris* falling upon them.

EFFECT OF THE HOT BLAST ON THE QUALITY OF IRON.—It has become the opinion of many that the use of the hot blast has deteriorated the quality of pig iron. But some of the foremost iron-masters, both in this country and Europe believe that the hot blast has actually improved our iron. Fairbairne and Hodkinson's experiments show a very decided improvement both in the tensile and crushing strength of hot blast over cold blast iron.

Architecture—Ancient and Modern.

Mr. Ferguson, in his History of Architecture, remarks that while in every nation the art was successful, wherever practiced up to the sixteenth century, since then "not one building has been produced that is admitted to be entirely satisfactory or which permanently retains a hold on general admiration."

The reason of this, says Mr. Day, in the preface to his recently published work on The Science of Æsthetics, is "That ancient architecture built suitably to the purposes of the building;—or as we may express it, grasping first the idea of the building, it then with the best material at hand proceeded intelligently to embody the idea in it; modern architecture, knowing vastly more of materials and of architectural details and having more constructive skill, has overlooked the vital element of old art—the actual incorporation of the idea into the material at its control. It has leaped blindly in hope to realize a perfect form, forgetting that no perfect form can be reached but in the rational way of expressing some idea in its appropriate matter, and that this expressing, this embodying, is the governing element in all art procedure and can never be realized but intelligently and aimingly, that is rationally, and in accordance with the laws of the rational nature."

DRILLING GLASS WITH EMERY.—An experiment similar to the sand blast action was recently made in Pittsburg as follows: A ¼ inch tin tube, six feet long, was mounted at an angle of 45 deg. This tube was supplied, on its lowest end, with a nozzle of 1-12 inch diameter. The tube was filled with emery powder. A sheet of double thick window glass was placed with its plane at a right angle with the tube and within two inches of the nozzle. A plug was withdrawn from the nozzle and the emery discharged from the tube. The operation was repeated three times in eighteen minutes. The result was the drilling of a hole through the glass and the wearing away of quite a portion of it, in fish-tail shape, below the hole, where the emery passed down the incline of the glass into a receptacle. The position of the glass was then changed, and a piece of thin sheet lead, having a hole of star shape cut through it was pasted on the glass with the hole opposite the nozzle of the tube. The result was a clear cut star-shaped hole through the glass, without marring the lead pattern in the least.

This is far more valuable than may at first glance appear, and will probably be applied at some of our glass houses for drilling or ornamenting glass. The editor of the *Manufacturer* in noticing this experiment says that he once spent the best part of two days carrying two small glass retorts around Pittsburg, trying to find an artist who could make holes in the bottoms of them, and failing gave it up and substituted others made to order.

CUTTING MARBLE, ETC.—A recently devised foreign apparatus for stone cutting uses comprises a head that can be rapidly rotated and provided with diamond cutters, so arranged that while each cutter removes material and traces a path over the molded surface to be produced, all the cutters produce surfaces free from distinct scratches. For cutting mostly on a horizontal face the head is solid in which the diamonds are mounted. For molding on an edge, the cutter head holds bits of steel studded with black diamonds. A rotary tool is shaped to finish the groove, and preferably formed of brass. For cutting as with a saw into marble, a small round vertical spindle is used, the surface of which is studded with black diamonds or carbon points, so arranged in rows that the cutting points of the different rows merge their paths of action, so as to cut the whole length of the cutting plane of the shaft.

THE DANK'S FURNACE.—Mr. Danks, inventor of the revolving puddling furnace, has taken out patents for his machines in Russia, Austria, Belgium, Germany, France, and Spain. The Belgian iron-masters are sending over to England a commission to report upon the working of the furnace. In Italy one is about to be introduced, and several engineers deputed by individual continental firms are now in this country for the purpose of examining the machine in practical operation. In Scotland the invention is looked upon with much favor, and arrangements are in progress for the erection of many. Opinion is strengthening as to the validity of Mr. Danks's right, especially as he has covered the weak points by a new patent. Some of the Welsh iron-masters dispute his claims, but it is understood that Mr. T. Hughes and Mr. Webster, Queen's Counsellors, have both, after careful examination, pronounced in his favor.

DIAGONAL-JOINTED BOILERS.—According to W. R. Browne, experiments made by Mr. Kirkaldy upon the relative strength of diagonal-jointed and of longitudinal-jointed boilers, show the strength of the diagonal joint to be one-third greater than that of the longitudinal joint, the former therefore increasing the strength of the boiler in the proportion of three to four.

ANOTHER IMMENSE BRIDGE.—It is proposed to throw a great bridge over the Hudson river at Poughkepsie. The bridge will be composed of five spans of five hundred feet each, and it will be one hundred and twenty feet in hight. It will connect New England with the coal-fields of Pennsylvania.

MINING SHAREHOLDERS' DIRECTORY—Meetings, Assessments and Dividends.

Notes.—†—California. *—Washoe. ‡—White Pine. §—Ely District. ¶—Eureka District. ‖—Idaho. |—Nearly. ¿—Over.

S. F. Stock and Exchange Board.

Thursday, August 8, 1872.

Last week 386 tons of ore was taken from the Sierra Nevada mine and 1,722 tons from the Chollar-Potosi mine, latter assaying $3,247 per ton.

Ou August account, $72,000 has been received from the Raymond & Ely mine.

The Kentuck mine sent 1,200 tons of ore to the mills in July.

The following is from a dispatch to the Crown Point—ore extracted week ending August 2d, 2,452 tons; sixty-five per cent. of assay of same, $82,549.12.

Hale & Norcross—Ore extracted wcek cnding August 3, 639 tons.

The dispatch to the Pioche, August 2 states: "North winze down 23 ft.; ore 2 ft.; aesay, $230. South winze down 38 ft., ore one and one-half foot; assay, $144."

Meadow Valley—Bullion shipped from July 8 to Aug. 1, $72,300.

On the 29th, from the Chollar Potosi, 128 tons ore wers shipped to mill, and on the 30th 136 tous, valued at $40.41 per ton.

A letter of July 27th says: "We made connection with the Burke tunnel from ths Chief of the Hill this afternoon. We have a fine ledge all the way from our original shaft to ths tunnel, 230 ft. Assays dnring the past week in drift where we made ths connection have run from $140 to $170 per ton."

The Superintsndent of the Woodville writing on July 30th, reportsd: "The drifts are looking well; the south drift of the lower level from iucline is uot as wids as it bas been, but the ore is of a higher grade, assaying $156 psr ton. In the north drift from the first level of ths incline the ore is improving; ae the drift advances north it is 6 ft. wide and still widening. Mills are running. I shall make a shipment of bullion next week.

The annual report of the Savage mine to July 1 shows a bullion production for this year of $905,295; expenses, $1,053,137; average of ths ore, $18 per ton. Milling at Savage mill, $9.94; at custom mills, $11.85. The Superintsndent states: "The mine shaft and the shaft incline are in excellent condition—never better. The work of sinking is continued with all possible energy. The entire machinery at both shafts, the hoisting gear and the pumping gear, are in good ordsr aud work emoothly. Two nsw steel wire ropes, two thousand feet in length each, are on the ground. Thess, with ths present powsr of the machinery, will enable us to sink to a great depth."

Ths dispatch to the Pioche on Auguet 3d, states: "North winze down twenty-four feet: ors two fest; aseay, $144. South winze down thirty-nine feet; ore 2 feet; assay, $225." The dispatch to the Belcher reports: "No change in mine. Connection of incline with ths drift will be made in a week."

The stock market opened weak on Friday morning, and all stocks excspt Savage were weak during the day.

From Thursday morning's sales, Belcher declined $10.50, Chollar-Potosi and Yellow Jackst each $8, Hale & Norcross $6.50, Segregated Bslcher $5, Overman $4.50, Ophir $3, Crown Point $2, Consolidated Virginia $1.50, Alpha, Excheqner, Imperial and Justice each $1. Savage advanced $6, Empire Mill, Gould & Curry and Trench each $1.

On Saturday the stock market wae quits strong with an evident disposition to buy. At the close Jackst was $1 lower than yesterday afternoon; Raymond & Ely, $1. Pioche advanced $1. Ophir rose $5; Belcher, $3; Crown Point, $3; Imperial, $2; Hals & Norcross, $1; Chollar, $2; Alpha, $4; Empire, $1; Con. Virginia, $2; Gould & Curry, $2.

There was a light business at the Stock Board on Monday morning, when only Washoe stocks were called. Prices were generally a shade better, the most notable advance being in Savage. From the highest ratee on Saturday, Savage advanced $10, Hale & Norcrose, $4.50, Belcher, $3, Empire Mill and Ophir each $2, Crown Point, $1.50, Alpha, Chollar-Potosi and Yellow Jacket, each $1. Gould & Curry declined $7, while Daney Consolidated, Virginia, Justice and other mining stocks were in moderatc demand on Tuesday morning, and prices without much change, though irregular and weak. From the highest rates yesterday morning, Belcher, Caledonia, Con. Virginia and Trench each advanced $2. Confidence, Crown Point, Seg. Belcher and Yellow Jacket each $1. Ophir declined $4. Gould & Curry, 2.50; Chollar Potosi, $2; Hale & Norcross, Overman and Savage each $1. Kentuck sold at $200, a decline of $10 from the previons sale July 26th.

Mining Stocks were in fair demand on Wednesday, but prices were weak and irregular. Crown Point was especially soft, receding to $130, the lowest in some time, under diminished receipts last month. From the highest rates yesterday, Chollar-Potosi advanced $5, Caledonia $3, Trench $2, Alpha and Belcher each $1.50, Confidence, Imperial and Yellow Jacket each $1, Crown Poiut declined $15 50, Kentuck $15, Savage $2, Consolidated Virginia $1.50, Mahogany, Ophir, Pioche and Raymond & Ely each $1.

Mining stocks were decidedly weak this morning for most kinds. Crown Point fell to $130. There was a break in the Savage, which dropped to $160. Kentuck was more active than it has been for a fortnight, closing at $300. From the highest rates yesterday, Kentuck shows an advance of $25, Yellow Jacket $8, Segregated Belcher $1 50, Alpha, Justice and Treuch each $1. Crown Point declined $7, Chollar-Potosi $6, Savage $12, Gonld & Curry $2.50, Belcher, Hale & Norcross and Ophir each, $2, Overman $3, Bacon, Caledonia and Consolidated Virginia each $1.

Mining Summary.

The following is mostly condensed from journals puhlished in the interior,in proximity to the mines mentioned.

California.

BUTTE COUNTY.

Specimen Ores.—Oroville *Record*, Aug. 3: Mr. Elton has shown ns some very rich specimens from his gold and silver ledges, Gravel Range Dist.

CALAVERAS COUNTY.

Upper County.—Calaveras *Chronicle*, Aug. 3: W. C. Boyls bought one-fifth of the Horsethief above Jesus Maria. A winze being sunk from ths lower level of ths Prussian Hill, has developed an extensive body of ore 8 ft. thick, 2½ ft. being first class. Fine looking quartz made its appearance in the main shaft of the Petticoat. The recent strike in the Wolverins appears to be extensive. A steam engine of 45-horse power is on its way to the mine. A lot of Blazing Star quartz and vein matter, from above watsr level, paid $30 per tou. The north level of ths Bartola showe free gold. The Heckendorn, Blue Mt., has been reopened. The capacity of the old mill will be increased to 8 stamps.

Blazing Star.—Harrie 5-stamp mill bas just concluded a 10 day's run, and the yield is $2,600. The rock was taken out of the main shaft from a depth of 70 to 124 ft.

Removal.—The Water Co's. mill, Chilli Gulch has been torn down, removed to Blue Mt. and is being put up on the Eckendorn miue.

Goon Pay.—Moser, Harrington & Co., ars making fair pay out of the tailings that have accumulated in Spring Gulch.

Horse-thief.—Rapid progrese is being mads in srecting machinery; there is plenty of rock on the dumps.

Starten.—The mill on ths State of Maine, near Big Bar on the Mokelumne rivsr, commenced crnshing Monday last. An excellsnt quality of rock is being taksn from the mine.

Struck It.—Good rock has been struck again in the Whisky Slide.

EL DORADO COUNTY.

Items.—Auburn *Stars and Stripes*, Aug, 1: The Cederburg maintains its splendid appearance. Ths St. Lawrencs is turning out large quantities of high average ore. The Columbia is dsveloping a 4-ft. ledge. The Ella is showiug richly in snlphurets and fres gold.

INYO COUNTY.

Shipment.—Inyo *Independent*, July 27: The Eclipee Co. shipped, per last stage, 2 bars of bullion, valued at $4,000.

MARIPOSA COUNTY.

Washington.—Mariposa *Gazette*, Aug. 2: The new shaft is about 220 ft. in deptb. Ths vein is nearly 15 ft. in thickness and the ore rich.

The Greenhorn is looking well. The shaft is down 285 ft. The ledge is abont 18 iuches in thickness.

S. D. Valentine is making arrangements to pnt up a 10-stamp quartz mill immediately.

The Coe mine ie engaged in pumping. The ledgs in the tunnel, which is in 760 ft. averages 1½ ft. thick.

The Knight of Malta ledge between wall and wall is from 8 to 10 ft. wide, and shows an abundance of sulphurets.

Gravel Mines.—The Hope is taking out gold, and runniug drifts. The Town Talk is taking ont in the neighborhood of $2,000, a profit of something like $1,200–from an 8 stamp mill.

Toward Rough and Ready Roberts & Co. are washing with success.

Rich Strike.—Cor. Nevada *Transcript*, Aug. 3: Large and rich quartz ledges have been discovered at Gaston Ridge within the past 3 weeks. They all excel in richness anything heretofore struck in Nevada county.

Baln Hill.—The Bald Hill claims, Gaston Ridge, during the past winter, have and are now paying nearly $20 per day to the hand.

PLACER COUNTY.

Excitement.—Auburn *Stars and Stripes*, Aug. 1: All around the circle from Ophir by way of Rock creek and clear over to Georgetown we hear of very numerons and rick strikes. At the Bellevue they are taking out rock filled with free gold and rich sulphurets. At St. Patricks the developments are richer and apparently more extensive than any heretofore made in that claim. At the Green, great slabs and masses of rich ore are being taken out. At the Auburn on Rock creek, the ledge is nearly 4 ft. wide.

PLUMAS COUNTY.

Jamison.— Quincy *National*, July 27: The Plumas Eureka have let a contract for the enlargement of their drain tunnel, and the contractors are at work.

SAN DIEGO COUNTY.

The Mines.—San Diego *Union*, July 25: The Owens is still better. The boys have lately struck ore "richer and more of it." The Bush boys are doing finely in their lead. In the canon the Golden Chariot Co. have been taking out rock full of gold.

Julian and Banner.—San Diego *World*, July 27: Next week, DeFrees, Pierce & Evans and DeLongs mills will be running. The Madden and Kentnck mines will soon have out considerable quantities of rock to be crushed.

The Antelope will yield from $150 $200 per ton.

The Golden Chariot will pay nearly $200 per ton. The mill commenced last Wednesday to crush a 100 tons of thie rock.

The Owens main shaft is down 260 ft. Stoping commenced yesterday.

The Good Hope shows as rich rock as any found. New discoveries in this ledge are causing some excitement.

The San Diego mine will soon run again.

SIERRA COUNTY.

ITEMS. — Downieville *Messenger*, July 27: The Caledonia Co., Cedar Grove, are doing well, and the Star Co., Greenwood, are similarly situated. Col. Baker, of Gardner's Point, has just realized a handsome clean up. The Monte Cristo and Union claims, Port Wine, are doing well. Williams & Cox, Scales Diggings have been doing exceedingly well at Scales and Council Hill. Barnard's diggings are now fully opened out. George Moyle prospected well. The Monumental Co. are doing as usual, paying large dividends. The Empire is driving ahead for the same lead. Cox & Co., Chandlerville, are cleaning up a very successful season's work. North America, Hepsidam, is taking out good pay. All the claims at Gibsonville and thereabouts are doing well. Tom Wheeler, at Morristown, has washed off an immense body of rich ground this season.

TUOLUMNE COUNTY.

MOUNT JEFFERSON. — Sonora *Independent* Aug., 3: The shaft is down over 200 ft., with a lode 10 ft. in width.

LARGE QUARTZ LODE.—The Spring Gulch Co., 18 miles east of Sonora, have come upon a vein 15 ft. in width, which prospects from $15 to $25 per ton, they are running 10-stamp mill.

ORCUTT.—Sonora *Democrat*, Aug., 2: The proprietors have commenced taking out very fine ore and the prospect is very flattering.

Nevada.

EUREKA DISTRICT.

ORE.—Eureka *Sentinel*, July 28: Adams Hill will make another shipment of 100 tons of $300 ore to S. F. soon.

ELY DIST.

LOCAL REVIEW.—Ely *Record*, July, 28: BULLION.—During the past week W. F. & Co. have shipped bullion valued at $139,935.67.

AMERICAN FLAG.—The stopes on the 180-ft. level continue to yield well, and the ore shows in good quantity throughout.

PIOCHE.—The ore in face of drift on upper level is constantly improving, and shows fully 5 ft. in width. In the north and south winzes on this level a constant improvement is noticeable and a large quantity of ore is being taken out and shipped to mill. Between the fourth and fifth levels a great improvement is also noticeable, and assays from all parts show increased value of the ore.

PACIFIC TUNNEL.—Driving steadily ahead, with main tunnel in 853 ft.; 3 ledges have been passed through. Small strata of fine ore are coming in on the face, and indications are favorable for soon tapping a good ledge.

CONNOR.—Drift from bottom of shaft in 16 ft., with ore in the face of the drift improving daily. Ore of a high grade is being taken out.

LOUISE.—The strike in Anna Dickinson shaft continues to improve, and ledge shows 4 ft. in width, carrying ore throughout.

SUNBEAM.—Drifting each way, to make connection to Bartou shaft, ore showing throughout the entire drift next to the foot wall. Sinking a winze on the lower level on ore.

CHIEF OF THE HILL.—Tracing drift in 55 ft. In the face of the drift ledge shows 3 ft. of solid high grade ore.

HARPER.—Sinking of shaft continues, and is down 10 ft. below first level, with the indications very favorable.

PHŒNIX.—We learn of a strike having been made during the past week. Ore of a character similar to that being taken from the Raymond & Ely having been cut into in the ledge.

PAGE & PANACA.—Shaft down 330 ft., and sinking progresses.

MOCKING BIRD.—Ledge in the bottom shows 3½ ft. in width, with ore about 22 inches wide.

HUHN & HUNT.—Drifting into the hill, and making about 10 feet per week.

EXCELSION.—Constantly improving in the lower workings, from which large quantities of fine ore are being taken out.

AZTEC.—On Monday last, in sinking the shaft, a body of ore was struck at a depth of 137 ft., which had widened out to 2¼ ft. on Tuesday evening last.

IVANHOE.—A very important strike was made Saturday last. Samples of the ore were a very rich chloride, coated with horn silver.

HUMBOLDT.

ARIZONA.—Unionville *Silver State*, Aug. 3: Another rich strike is reported. The new tunnel being run west of the old works is expected to cut the ledge inside of 30 ft.

INDIAN DIST.—Jurien Lott and Peto Spray have discovered an exceedingly large, rich, and well defined ledge.

CENTRAL PACIFIC.—The mine turns out richer ore than ever before. The Batavia Co's. mill is running steadily, and the camp is unusually lively.

REESE RIVER.

Reese River *Reveille*,, July 27: LONE STAR. Large quantities of fine ore have been coming out for a number of months.

S. C. BAKER.—The incline is down 150 ft., and will be put down 50 ft. further. A splendid body of ore in sight, but will not be raised till the old incline is repaired.

ISABELLA.—Ore at all points of mine, and very rich.

SEMANTHE.—The ledge looks well at the bottom of the incline.

OREGON SHAFT.—Rich ore in abundance is steadily coming out.

GROVE TUNNEL.—High grade ore is being raised from both east and west 200-ft. levels.

MORGAN & MUNCEY.—The lessees at the 200-ft. level are running through the break; raising no ore at present.

SARATOGA.—This mine is turning out ore in unlimited quantities and of unsurpassed richness,

LANE & FULLEN (Pacific Co.).—The recent crushing shows that the rock is of high grade, as the first-class went nearly $900 per ton.

YANKEE BLADE.—CHASE TUNNEL.—A body of very good ore was struck in this tunnel recently.

ENSIGN & SOUTHAL.—Good ore coming from the incline.

COLUMBUS DIST.—The mines are reported as looking exceedingly well. A 5-stamp mill is running and doing a good business.

At Hot Springs, 40 miles from Columbus, a 10-stamp mill is being erected.

BELMONT.—THE EL DORADO CON. Co Are taking out ore that assays up into the thousands.

BELMONT Co—Is working some 30 men in the Canfield, and a small force on the Highbride.

MONITOR Co.—Working 40 men and taking out very fine ore.

COMBINATION Co—Still working a full force.

WASHOE.

LOCAL SUMMARY—SAVAGE.—Gold Hill *News*, August 3: Daily yield 178 tons, worth $28. Incline down 110 ft., and making slow progress. Prospecting the body of ore found in the south cross-cut of the 1,500-ft level, goes slowly on; the quality of the ore is steadily increasing.

YELLOW JACKET.—Daily yield 25 tons, from the old workings at and above the 1,000-ft. level. The 1,500-ft. level from the incline is being opened.

CROWN POINT.—Daily yield 330 tons. The cave has been sufficiently secured to allow of a full force being employed at the 1,200-ft. level.

OPHIR.—The west drift of the 700-ft. level is in 50 ft. in ledge matter. The north drift on the 1,100-ft level is driven ahead. Face in hard porphyry.

BELCHER.—Daily yield 250 tons from the 1,000 and 1,100-ft. levels. The drift west from the 1,100 has reached the point of intersection with the main incline from above, and a raise is being made to meet it. The main drift east from the incline, at the 1,000-ft. level, is in promising ledge matter.

KENTUCK.—Daily yield 65 tons, from old workings about the 5th and 6th levels.

CHOLLAR-POTOSI.—Daily yield 180 tons worth $37. There has been a decided improvement in the quality of ore in the various breasts during the week.

SIERRA NEVADA.—Daily yield 55 tons that pays a good profit. All the ore breasts are looking and yielding well. The winze from the west drift of the upper level is down 30 ft. in good ore. The west drift from the 100-ft. raise in the lower tunnel will soon tap the ore body found in the winze from the upper level.

IMPERIAL EMPIRE.—The southeast drift at 1,550-ft. level is started ahead again, and the ore body shows 17 ft. in width. The station of the 1,650-ft. level is being opened from the incline, and a drift to intersect the new ore body in the level above is to be started forthwith.

BUCKEYE. The ore stopes south of the incline are turning out better and showing heavier and richer deposits as further developed.

BALTIMORE.—New shaft down 186 ft.

KNICKERBOCKER.—New shaft down 38 ft. below the 400-ft. station, and water decreasing.

RED JACKET.—The ore from the lower level is being taken out for milling. There are about 200 tons on the dump.

DANEY.—No further sinking will be done in the shaft until the pump-bob and other arrangements for raising the water are completed. Prospecting goes on at the 500-ft. level.

CON. VIRGINIA.—Crosscutting at the 500-ft. level, and drifting at the 1,166-ft. level continues. The prospects are excellent.

UTAH.—The new shaft is being sunk rapidly, and the new hoisting works operate admirably.

WOODVILLE.—Only ore enough has been taken out to keep the mill running. It is yielding finely in bullion.

CALEDONIA.—The drift west at the 700-ft. level is in 42 ft. The rock is hard but blasts well. At the 400-ft. level the drift is 333 ft., and a crosscut is being run but no good pay ore is found. Considerable prospecting is being done in the old mine.

GOULD & CURRY.—The main level is down 107 ft. below the 1,500-ft. level. The east drift of the 1,500-ft. level is in 210 ft., the north drift 135 ft., the south drift 130 ft., all in hard porphyry.

JUSTICE.—The drift at the 400-ft. level is in 63 ft. from the shaft and is about cutting the ledge. The old Waller Defeat shaft is being sunk deeper and the vein has been cut by the bottom of it, showing some very good ore.

HALE & NORCROSS.—Daily yield 100 tons from the old upper workings except some 20 or 30 tons from the 1,400-ft. level. The incline is down 97 ft. below the 1,500-ft. level.

OVERMAN.—The drift west at the 100-ft. level is in 510 feet, and the face is in favorable looking matter. The shaft is down 20 ft. below the 1,100-ft. station.

SILVER HILL,—Drifting for a new level is commenced from the bottom of the shaft.

ARIZONA & UTAH.—The west wall of the ledge has been reached. A raise is being made to connect with the upper levels for air.

JACON LITTLE.—The ore vein in the tunnel shows considerable improvement.

SUTRO TUNNEL.—Total length, 2,986 ft. Work both in the tunnel and air shafts along its line, progresses energetically.

WHITE PINE.

TREASURE HILL MINES.—BULLION.—White Pine *News*, July 27: Amount forwarded the past week amounts to $25,776.63.

EBERHARDT & AURORA Co.'s MINES.—In the Eberhardt a whim is being erected to prospect the mine at a greater depth. The shaft is down 148 ft., and it is the intention to go down and prospect the mine thoroughly. The ore in the Ridsdale and De Pass chambers, in the North Aurora, has, for the past two weeks, greatly improved in quality. The rock is of a higher grade, more uniform, and requires less assorting. In the north end of the North Aurora, in the chamber south from the Lady's chamber, the rock has improved in quantity and quality, with every indication of a large body of high grade ore. It is 40 ft. high, no end or side to it, and the bottom has not been reached.

BEECHER CON. M. & M. Co.—The south end is looking well. The Ward Beecher proper is taking out good ore, and shipping to mill. The Edgar shaft has been enlarged and timbered to the bottom, and will commence hoisting ore the coming week.

SILVER WAVE.—Continues working in the ledge of ore lately struck, and preparing to start the mill to-day.

O. H. TREASURE.—The body of ore in the lower tunnel is looking much better. The country rock has changed somewhat from limestone, and are running in shale quartz and spar. The assays made average from $3 to $10 per ton, and it is expected to strike the vein in the next 20 ft. The Co.'s mill is running steadily on the Co.'s ore.

PENNSYLVANIA S. M. Co.—The usual force of men is employed. The Jackson shaft is down 50 ft.

EAST SHENOYGAN.—A part of the force is employed in the Exchange drift and Regent drift, from which places ore of a good grade is being extracted. A force has been put on to prospect into the hill from the southwest drift, where the indications are very favorable.

COPPER GLANCE.—A force has been put on the croppings and surface workings, and ore of good grade is being obtained.

SAN JUAN DEL RIO.—The Co. is vigorously sinking in the Dwinelle shaft.

SUNBEAM.—The Moscow shaft has been cut across, and taking out good ore. Are in about 9 ft. in the East drift, in a fine body of ore, about 100 ft. from the Moscow shaft.

NOONDAY.—Taking out good ore from the surface works.

HAMILTON M. & M. Co.—A large body of good ore has been struck in the tunnel of the Pogonip, running East. The Charter Oak is looking well.

MAMMOTH.—Working a small force taking out rock for shipment to mill. Mine looking well.

Colorado.

E. W. Rogers is working the Junction lode, Democrat mountain. He has commenced a new tunnel on the vein. The ore vein in the lode is about 2 ft. in width, consisting of sulphurets intermixed with quartz.

The Pelican never looked better. During June the mine furnished 3 car loads, over 30 tons, of shipping, besides the usual quantity and quality of amalgamating ore.

A short distance east of the Coldstream lode, in Sherman Mountain, is the Capt. Wells. In all the openings a good ore vein was to be seen. The present work is being done in a shaft east of any previous working, and a depth of about 20 ft. has been obtained. The bottom of this shaft shows a good ore vein, consisting mainly of red decomposed ore. The decomposed mineral assays about 170 oz., the hard mineral found, often liberally intermixed with ruby silver and gray copper, assays as high as 300 oz. in silver to the ton.

Watson & Grissinger are opening the Seven-Thirty lode, Sherman mountain. The ore obtained is of great richness, running well up in the hundreds of ounces per ton.

The Chicago S. S. & R. Works are running 12 furnaces and are preparing to double this number.

A body of red argentiferous galena ore has been struck in the Coldstream lode, in the lower end, 50 ft. from the surface discovery, 100 ft. below the highest point where red pay was taken out.

The mill at the Boston S. M. As., at St. John's, Summit county, will soon be in readiness to commence operations.

CARDINAL.—Caribou *Post*, July 13: Work has been resumed on the Sovereign People lode; Cardinal, Gunu & Co. having taken contracts to sink the discovery shaft 60 ft., and the East shaft 40 ft.

Richard Pierce has fired up his furnaces preparatory to charging them with ore next Monday.

ITEMS.—Colorado *Miner*, July 25: The Bobtail Tunnel Co., Gregory Point, have driven their tunnel 600 ft. within the past year. The Fisk lode has been tapped and completely drained.

Two young men have just discovered and opened a vein on the top of Leavenworth Mt. that has gone far ahead of anything yet discovered in our region.

A LOT of ore, weighing about 2,300 lbs., from one of the mines in the vicinity of Georgetown, sold last week for over $2,000.

GLASGOW.—Colorado *Miner*, July 18: The Glasgow lode is being worked by a drift from the Brown tunnel. The ore vein is of good size and the mineral is of good quality.

The Steward S. R. Co., started their machinery yesterday, and will be in full blast and ready to treat ore by Monday.

ANTELOPE.—On the surface the vein shows a crevice between walls of about 14 ft. A cross-cut tunnel, 30 ft. in length, reaches the vein, along which a drift, 60 ft. long has been driven. About 40 ft. from the end of the cross-cut a shaft has been sunk 50 ft. disclosing an almost continuous ore vein the entire depth. From the bottom of this shaft a drift is being run east, now about 30 ft. long, and also a drift west, now in about 12 ft.

COLORADO GULCH.—Central *Register*, July 17: Stillings & Emery have found excellent ground at the head of Frying Pan Gulch.

The 5-20's stamp mill is pounding away night and day.

Montana.

ITEMS.—Helena *Herald*, July 18: The Helena R. Works shipped yesterday 26 tons of bullion.

Two silver bars are on exhibition at the First National Bank, the result of the last run of the Jefferson Smelting Works. Their value is $2,600.

Eight hundred pounds of bullion arrived last night from Philipsburg, the product of the Speckled Trout.

QUARTZ CREEK.—Deer Lodge *New North West*, July 20: A joint stock Co. have opened ground on Fifty, and struck a prospect that will pay good wages for drifting. Other Cos. are opening above and below them, with strong hopes of success; most of the old ground has been paying reasonably fair wages so far. On Little Bear and Sunrise the miners are doing very well.

FLINT CREEK.—Cor. same: The Imperial S. M. Co. is repairing their little 5 stamp mill, with wooden stamps, for work. The St. Louis mill is running like clockwork. There are fair prospects of the Trout Mine alone, furnishing quartz enough for 40 stamps for dry crushing. Two enterprising men are bringing a ditch from Flint Creek into Phillipsburg, for milling and mining purposes.

AROUND THE CAMPS.—Helena *Gazette*, July 22: Hobbins & Co. own 500 ft. of ground, which pays one ounce to the hand. Brennan & Co.'s ground pays from $10 to $12. Pierce & Landan expect to reap a good crop of dust this fall. Snyder & Co. have brought in a $5,000 ditch on a bar below town. Kennedy & Co. are putting in a bedrock flume 3 miles below town—working 20 hands. Chas Herrick discovered a quartz lead six miles above Bear Town—on the main divide between Bear and Elk, a few days ago, and obtained 25 cents to the pan in the decomposed quartz—a vein 6 ft. wide.

Idaho.

LOCAL RECORD.— Owyhee *Avalanche*, July 27: The Elmore 8th level drift is connected between the winze and shaft, and as soon as the track can be laid down, stoping will be commenced at the winze which was sunk through good ore for 100 ft., from the 7th to the 8th level.

The Mahogany is yielding rich ore in abundance, especially from the 5th level.

The Minnesota ore is milling much better of late.

The Empire is running 2 drifts from the bottom of the shaft, one north and the other south.

The Red Jacket is being quite extensively worked. Two working shafts are being rapidly put down. The north shaft is down 50 ft. and is yielding fine ore. The shaft is 22 ft. deep. Last Saturday the vein was cut, showing it to be 2½ ft. wide of high grade ore.

Sands & Co. had 50 tons of Illinois Central ore crushed at the Cosmos mill this week, which went a few cents over $80 per ton, and yeilded them over $4,000.

The War Eagle shaft has been thoroughly retimbered and repaired, and the hoisting works will soon be ready for operation.

Utah.

BULLION. — Salt Lake *Tribune*, July 22: Walker Bros. received from their Pioneer mill on Saturday 6 bars of silver valued at $6,758.09 in gold. They have shipped since the starting of the East Cañon mill 51,000 ozs. of silver.

NORTH STAR.—The Hickory vein, which is large and well defined, has been sunk on a little over 60 ft., prospected for a short distance by 2 drifts, and stripped for a considerable distance on the surface. The ore in sight is estimated to be about 3,000 tons, which from careful assays will mill $100 to the ton.

MINING ACCIDENTS.—William Williams, underground foreman in the Crown Point, was considerably burned about the back and shoulders last week by the explosion of a blast.

On the 3d instant, James Cook, a miner employed in the Crown Point mine, in attempting to jump upon a train of cars loaded with ore, and passing through Gold Hill, lost his balance and fell so that the wheels of two cars passed over him, cutting off both legs above the knees, and killing him instantly.

A. B. Parson, a miner working in the Bullion Mine, Washoe, was quite severly but not dangerously hurt by a cave, on the 2d inst.

The Virginia *Enterprise* of the 3d says that the day before, the cage at the Imperial Empire shaft had been lowered with a man on it to the 1,300-ft. platform level, and he had just got off when the wire cable parted, about 130 feet below the surface, and the whole came thundering down upon the cage. No material damage was done, but it is difficult to understand why made the cable break just then and there.

California Tulip.

We herewith present the readers of the RURAL with an engraving from Nature of one of the most beautiful wild flowers of San Joaquin Valley and other parts of California. It belongs to the tulip family, and is properly called the California tulip, as its species are natives of our State.

The species engraved here is of a light yellow, or straw color. Though reminding one at first glance of the California poppy, it can be readily distinguished from the latter by the fact that it has but three flower leaves or petals, while poppy has four. Another means by which those at all acquainted with botanical terms can distinguish them is, the tulip has only six stamens and one pistil, the latter three-cleft, but the poppy has more than twenty stamens. Again, the tulip is bulbous, the poppy not. The yellow tulip grows on the hard, knolly land of the valley, and also in the foothills of the Sierras.

Two species besides the yellow are fonnd in the same localities, differing chiefly in color. In one, the flower leaves are of a greenish white, most of the inner surface sprinkled as if with a purple powder. It also has a large purple spot uear the base of each petal, on the inside, resembling in shape and appearance the eye of a peacock's feather. A third kind, which is found only in the mountain districts, is of a light purple or lilac color, having a darker spot or eye, on the inner surface of each flower-leaf, like the species just described. These tulips when open measure from one to two inches across the month of the flower. Each plant sends up from a hulb a single stem one or two feet high, producing from one to four flowers. The leaves are few and short, forming sheaths around the base of the flower-stems, as represented in the engraving.

The Latin, or systematic names of the three species mentioned above, are *Cyclobothra puchella*, the yellow kind—*puchella* meaning beautiful; *C. alba*, the white; and *C. purpurea*, the purple tulip. A fourth kind belonging to California, but which the writer has not ye found in San Joaquin Valley, is *C. monphylla*, or one-leaved tulip, which is described by botauists as having bright yellow flowers, three in uumber, a single leaf, aud a stem less than a foot high.

The name Cylibothra means *circular pit*, from the Greek *kuklos*, a circle, and *bothros*, a pit, and was given to this flower by Robert Sweet, an English Botanist, in allusion to the round hollow formed by the lower portion of the flower. By an examination of this pit in any perfect flower of the kind, one will see that it is almost an exact hemisphere.

The upper edge of this pit in each species is heavily bearded. A common name among children in the mountains for these flowers is *cat's ears*, alluding to the shape of each flower-eaf.

Beautiful as the California tulip is in its wild state, it could no doubt be mnch improved hy culture, and is well worthy of a place in our ornamental flower gardens.

And what would you think, children, were any one to tell yon, that if yon had heen living a good many years ago, and could have introduced our California tulip into Europe, you might have made thousands of dollars by it. Strange as it may seem, it is even so. For a long time ago in Holland, there was such a rage to have beautiful tulips, that rich men gave thousands and thonsands of dollare jnst to get some new kind, such as nobody elee had. This rage went so far and lasted so long, that people were thought to be crazy about it, and it was called the tulip mania. Now when the tulip mania was at ite hight, you would have had a chauce to make a handsome fortune just by carrying to Holland the four kinds of tulip that are natives of California, for they would have boen entirely new in Enrope. Some old nabohs might have given you five thousand dollars or more for one kind. Some neighhor of his, just from a spirit of rivalry, might have out-bid him a few thousand more for the next, and so on, until you might have made $40,000 or $50,000 by the investment. Don't you wish you could have tried it? Do some of you eay you would like to try it now? It is too late. The tulip mania is over. Though people valne beautiful flowers now, they will pay only what is reasonable for them. They prefer to speud their money in more useful ways. And then, you know, if you made money as easily as we were talking of, you would not valne it. You would be apt to spend it quite as fast ae you made it. After all, far the best way to make money and do well in life, is by studying hard and forming good habits while young, that you may be industrious, and prudent, and saving as you grow older. And while we strive to attend properly to all the duties of life, let us always admire and love flowers, as among the most beautiful gifts that God has hestowed upon man.

RALPH RAMBLER.

United States Mining Laws and Regulations Thereunder.

[Continued.]

28. The claimant is required in the first place to have a correct survey of his claim made under authority of the Snrveyor General of the State or Territory in which the claim lies; such survey to show with accuracy the exterior surface boundaries of the claim, which boundaries are required to be distinctly marked by mouuments on the ground.

29. The claimant is then required to post a copy of the plat of such survey in a conspicuous place upon the claim, together with notice of his intention to apply for a patent therefor, which notice will give the date of posting, the name of the claimant, the name of the claim, mine or lode; the mining district and county, whether the location is of record, and if so, where the record may be found; the number of feet claimed along the vein and the presnmed direction thereof; the nnmher of feet claimed along the lode in each direction from the point of discovery, or other well-defined place on the claim; the name or names of adjoining claimants on the same or other lodes; or if none adjoin, the name of the nearest claims, etc.

A CALIFORNIA TULIP—CYCLOBOTHRA PUCHELLA.

30. After poeting the said plat and notice upon the premises, the claimant will file with the proper register and receiver a copy of such plat, and the field-notes of survey of the claim, accompanied by the affidavit of at least two credible witnesses that euch plat and notice are posted conspicnously upon the claim, giving the date and place of such posting; a copy of the *notice* so posted to be attached to, and form a part of, said affidavit.

31. Attached to the field-note so filed must he the sworn statemeut of the claimant that he has the possessory right to the premises therein described, in virtue of a compliance by himself (and by his grautors, if he claims by purchase,) with the mining rules, regulations, and customs of the mining district, State, or Territory in which the claim lies, and with the mining laws of Congress, such sworn statement to narrate briefly, but as clearly as possible, the facts constituting such compliance, the origin of his possession, and the basis of his claim to a patent.

32. This affidavit should he supported by appropriate evidence from the mining recorder's office as to his possessory right, as follows, viz: Where he claims to be a locator, a full, true and correct copy of such location should be furnished, as the same appears upon the mining records; such copy to be attested by the seal of the recorder, or if he has no seal, then he should make oath to the same being correct, as shown hy his records; where the applicant claims as a locator in company with others, who have since conveyed their interests in the lode to him, a copy of the original record of location should he filed, together with an abstract of title from the proper recorder, under seal or oath as aforesaid, tracing the colocator's possessory rights in the claim to such applicant for patent; where the applicant claims only as a purchaser for valuable consideration, a copy of the location record must be filed, under seal or upon oath as aforesaid, with an abstract of title certified as above by the proper recorder, tracing the right of possession by a continuous chain of conveyances from the original locators to the applicant.

33. In the event of the mining records in any case having been destroyed hy fire or otherwise lost, affidavit of the fact should be made, and secondary evidence of possessory title will be received, which may consist of the affidavit of the claimaut, supported hy those of any other parties cognizant of the facts relative to his location, occupancy, possession, improvements, &c.; and in such case of lost records, any deeds, certificates of location or purchase, or other evidence which may he in the claimant's possession, and tend to establish his claim, should be filed.

34. Upon the receipt of these papers the register will, at the expense of the claimant, publish a notice of such application for the period of sixty days, in a newspaper published nearest to the claim, and will post a copy of such notice in his office for the same period.

35. The notices so published and posted must be as full aud complete as possible, aud embrace all the *data* given in the notice posted upon the claim.

36. Too much care cannot be exercised in the preparatiou of these uotices, inasmuch as upon their accuracy aud completeness will depend, in a great measure, the regularity and validity of the whole proceeding.

37. The claimant, either at the time of filing these papers with the register, or at any time during the sixty days' publication, is required to file a certificate of the surveyor general that not less than five hnndred dollars' worth of labor has been expended or improvements made upon the claim by the applicant or his grantors; that the plat filed by the claimant is correct; that the field notes of the survey, as filed, furnish such an accurate description of the claim as will, if incorporated into a patent, serve to fully identify the premises, and that such reference is made there to natural objects or permanent monuments as will perpetuate and fix the *locus* thereof.

38. It will be the more convenient way to have this certificate endorsed hy the surveyor general, both upon the plat and field notes of survey filed by the claimant as aforesaid.

39. After the sixty days' period of newspaper publication has expired the claimant will file his affidavit, showing that the plat and notice aforesaid remained conspicuously posted upon the claim sought to he patented during said sixty days' publication.

40. Upon the filing of this affidavit the register will, if no adverse claim was filed in his office during the period of publication, permit the claimant to pay fer the land, according to the area given in the plat and field notes of survey aforesaid, at the rate of five dollars for each acre and five dollars for each fractional part of an acre, the receiver issuing the usual duplicate receipt therefor; after which the whole matter will be forwarded to the Commissioner of the General Land Office, and a patent issued thereon if found regular.

41. In sending up the papers in the case the register must not omit certifying to the fact that the notice was posted in his office for the full period of sixty days, such certificate to state distinctly when such posting was done and how long continued.

42. The consecutive series of numbers of mineral entries must be continued, whether the same are of lodo or placer claims.

43. The surveyor goneral must continue to designate all surveyed mineral claims as heretofore hy a progressive series of numbers, heginning with lot No. 37 in each township; the claim to boso designated at date of filing the plat, field-notes, &c., in addition to the local designation of the claim; it being reqnired in all cases that the plat and field-notes of the survey of a claim must, in addition to the reference to permanent objects in the neighhorhood, describe the *locus* of the claim with reference to the lines of public snrveys by a line connecting a corner of the claim with the nearest public corner of the United States surveys, nnless such claim be on unsurveyed lands at a remote distance from such public corner; in which latter case the reference by course and distance to permanent objects in the neighborhood will be a sufficient designation by which to fix the *locus* until the public surveys shall have been closed upon its boundaries.

ADVERSE CLAIMS.

44. The seventh sectiou of the act provides for the adverse claims; fixes the time within which they shall be filed to have legal effect, and prescribes the manner of their adjustment.

45. Said section requires that the adverse claim shall be filed during the period of publication of notice; that it must be on the oath of the adverse claimant; and that it must show the "*nature*," the "*boundaries*," and the "*extent*" of the adverse claim.

46. In order that this section of law may be properly carried into effect, the following is communicated for the information of all concerned:

47. An adverse mining claim must be filed with the register of the same land office with whom the application for patent was filed, or in his absence with the receiver, and within the sixty days' period of newspaper publication of notice.

48. The adverse notice must be duly sworn to before an officer anthorized to administer oaths within the land-district, or hefore the register or receiver; it will fully set forth the nature and extent of the interference or conflict; whether the adverse party claims as a purchaser for valuable consideration or as a locator; if the former, the original conveyance, or a duly certified copy thereof, should be furnished, or if the transaction was a mere verhal one he will narrate the circumstances attending the purchase, the date thereof, and the amount paid, which facts should be supported hy the affidavit of one or more witnesses, if any were present at the time, and if he claims as a locator he must file a duly certified copy of the location from the office of the proper recorder.

49. In order that the "*boundaries*" and "*extent*" of the claim may be shown, it will be incumbent upon the adverse claimant to file a plat showing hie claim and its relative situation or position with the one against which he claims, so that the extent of the conflict may be the better understood. This plat must be made from an actual survey by a United States deputy surveyor, who will officially certify thereon to its correctness; and in addition there must be attached to such plat of survey a certificate or sworn statement by the surveyor as to the approximate value of the labor performed or improvements made upon the claim of the adverse party, aud the plat must indicate the position of any shafts, tunnels, or other improvements, if any such exist upon the claim of the party opposing the application.

[To be Continued.]

AN English company will erect smelting works in Denver. Citizens of Deuver have subscribed money enough to pay for all the ground needed hy the company.

Useful Information.

How to Destroy Musquitoes.

A correspondent of the *Scientific American* recommends the following plan for destroying these nocturnal pests:—The strongest crystallized carbolic acid should be placed in a bottle, and covered with the same quantity of strong red codliver oil; shake the bottle thoroughly until a whitish colored foam appears; if such foam does not arise, however, a small quantity of powdered lime should be added, with a little water. Pour the mixture into a dish or other convenient article, and place directly under the open window, as it is from this quarter the musquito enters.

In my humble opinion, the effect should be explained in this manner: The moment the musquito enters, it loses the scent of blood; for, as the combined odor of the oil and acid is much more powerful than that of blood, it follows, as a consequence, that the musqnito becomes suddenly perplexed. The consequence is, that after scrambling and skirmishing around in the dark, the musquito is led, as it were, instinctively into the mixture, where it is either drowned in the oil or burned to death by the acid.

Formerly I was accustomed to smear my face, arms and breast with the strong oil alone, but I frequently arose in the morning smelling so terribly that, though it protected me from musquito bites, I was happy to lay it aside. I have slaughtered more musquitoes with the article explained above than ever I could have done with my fists or any other dangerous weapons.

American Soda-water.—Soda-water was first made about seventy years ago. The credit of the invention is said to be due to Austin Thwaites, of Dublin.

The manufacture of soda-water, and the methods of drawing it, have been vastly improved during the past ten or fifteen years. In few other departments of inventive taste and skill have greater strides been made toward perfection during the period named. American ingenuity seems to deserve the credit of leading the van in this march of improvements, for even the French, with all their skill in matters bibulous and gastronomic, learned something new about drinkables when some enterprising Yankees set up an "American soda fountain" at the Exposition of 1867. The "*soude Americaine a la creme glacee*" was a novelty to the Parisians and their guests, and met with a hearty welcome from all.

A Paris paper in noticing it said: It is really one of the curiosities of the Exposition to watch the representative of every nation on the face of the globe as they make a first trial of the new beverage. The crowd is so great that they are formed in a line by the police, and, first securing chocks, take a drink in turn. As many as 4,000 glasses have been sold in one day, much to the satisfaction of the parties in charge. The contrast between the soda as served in the American style and the *eau gazens* of the French café is so decided as to make the permanent introduction of the former a certainty.

The American soda apparatus is now in use not only in Europe, but has found its way to far-off Australia, and even to China.

Teeth in Young Sturgeons.—The discovery announced some months ago of the existence of teeth in the young sturgeons has been verified by another observer, who states that in the young of the sterlet there are ten teeth in the upper jaw and eight in the lower. This illustrates a very striking difference in habit between the young and the old. The latter, as is well known, have no teeth, and are believed to be somewhat herbivorous in character, or, at least, to feed only on sluggish invertebrates, while the former are quite voracious in their attack upon free-swimming animal prey. The precise period at which these teeth disappear has not been ascertained.

Origin of Pearls in Oysters.—According to Mr. Garner, in a paper read before the Linnæan Society, the production of pearls in oysters and other mollusks is caused by the irritation produced by the attacks of the minute entozoon known as *Distoma;* and he thinks that by artificial means the abundance of this parasite may be greatly increased. British pearls are obtained mostly from species of *Unio*, *Anodon* and *Mytilus*, but it is probable that all mollusks, whether bivalve or univalve with a nacreous lining to the shell, might be made to produce pearls.

Metallic Soap for Canvas.—The following is highly recommended as a cheap and simple process for coating canvas for wagon tops, tents, awnings, etc. It renders it impermeable to moisture, without making it stiff and liable to break. Soft soap is to be dissolved in hot water, and a solution of sulphate of iron added. The sulphuric acid combines with the potash of the soap, and the oxide of iron is precipitated with the fatty acid as insoluble iron-soap. This is washed and dried, and mixed with linseed oil. The addition of dissolved India-rubber to the oil greatly improves the paint.

Science Perfecting Swimming.—Frederick Barnett, of Paris, has patented a novel yet simple apparatus for swimmers. The invention consists in supplying to man by art the apparatus which has been given to the frog by nature. For the hand, he has a large membranous fin which is held to its place by loops passing over the fingers and a strap around the wrist. The surface presented to the water by these fins is so large as to add greatly to the effectiveness of the strokes of the arm, but not so large as to exhaust the muscular power. Their effect is to very much reduce the effort usually required in swimming. But the greatest ingenuity is displayed in the form and fitness of the fins for the legs, which are attached to the ankles, and are so formed that they act upon the water, in the movement of bringing forward the legs as well as in throwing them back. They act so finely in treading water, as swimmers call it, that one can really walk, if not on the water, at least in it.

The difference between swimming with this apparatus and without it, is very much like the difference between rowing a boat with a handle and the blade of an oar. The old swimmer has no trouble in using the fins at first trial, and is surprised to find with what strength he can swim without exhaustion. He easily swims twice as fast with the apparatus as without, it and with it he can sustain himself for hours upon the water, or swim many miles.—*Scientific American.*

Will not this invention tend to save human life? We regard the art of swimming something more than a luxury. Every child—boy and girl—at ten years of age should be taught to swim. It is a duty which parents owe to children. We teach them various arts by which to earn a living, why not the art of swimming, by which to *save* life? In France, every soldier is taught to swim as a part of his military education.

To Remove Tar, Turpentine, etc., from Objects.—By accident, I recently discovered a simple combination that will speedily and effectually remove from glass, porcelain, hands, or any part of the body, Venice turpentine, tar, pitch, or any sticky substance of a like nature that will resist warm water and soap. It is entirely harmless to the skin, and yet will remove these substances as promptly and as thoroughly as soap and water will remove common dirt.

All are aware how difficult a task it is to cleanse a graduate after measuring any given quantity of Venice turpentine, or to remove the traces of a rather soft, sticking or other plaster, from the human body. Now to let the "cat out of the wallet," here is the secret in a nut-shell.

For Cleansing Glass.—An amalgam of the pulverized extract of licorice and oil of aniseed. This seems to combine with the turpentine, and it may then be rubbed dry and clean with a pledget of cotton.

For cleansing tar or pitch from the skin, make a mixture about the consistency of thick cream, and rub on thoroughly with the hand; then follow with a piece of good soap, a sponge, and warm, soft water.

We give you this gratuitously on the condition that you inform me if it does not do what we claim for it.—*Cor. Med. and Surg. Rep.*

Coal Transportation.—It would require ten thousand locomotives and two hundred thousand cars to carry the annual product of Pittsburg coal to market, and yet Congress grumbles about making appropriations to keep the Ohio in a navigable state. Do railroad companies grumble at the expenses necessary to keep in proper repair their roads? Estimating the value of the Ohio river according to the transportation it affords, it is the cheapest line that can be sustained, and pays better dividends to consumers in the way of cheaper products than the best railroad stock in the country.

Improved Dining Table.—The dining tables of the Oneida community, Oneida county, N. Y., are made double, and the central part revolves. All articles of regular use, such as bread, butter, salt, water pitcher, goblets, spoons, milk, sugar, etc., are placed on this central portion, and persons seated at the table wait on themselves, by turning the center until the thing they want swings around in front of them.

One of the most marked organic differences between the sexes is that of muscular action. No one who carefully watches the muscular acts of woman will fail to perceive a tendency to do them with a sort of rush, with a superabundance and sudden exertion of force rather than by the gradual application of the precise amount by which the end in view can be secured.

Detersive Paste for Removing Grease from Silk.—Rub together fine French chalk and lavender to the consistency of a thin paste, and apply thoroughly to the spots with the fingers; place a sheet of brown or blotting paper above and below the silk, and smooth it with a moderately heated iron. The French chalk may then be removed by brushing.

Red Ants, if made angry, discharge a very pungent acid substance, called formic acid, "formica," being the word for ant. If these ants are distilled, a substance is produced so burning that if it is dropped on the skin, it eats into it like fire. It is also derived from the stinging nettle.

Good Health.

Aphasia.

This disease of the memory or impairment of the idea or power of expressing language may be illustrated by the following instances: A gentleman of seventy years, when wishing for anything, constantly employed some inappropriate word. If he desired bread, he asked for his boots, yet would be furious when these were brought. If he wished a tumbler to drink from, he would call for an utterly unsuitable vessel, and *vice versa*. Yet he was conscious that he used the wrong word, for if another person suggested the proper word he at once adopted it. Sometimes the substitution is applied to a single letter. An instance of this occurred in a learned patient of Dr. Crichton's who substituted the letter *z* for *f*, and, if he desired *(Kaffee)* or coffee, he asked for *(Katze)* a cat. A singular case was that of Madame Heunert, who asked for a table when she wanted a chair, and for a book when she desired a glass, and even when the proper word was suggested she could not pronounce it, yet she conducted her household affairs with accuracy and regularity.

Not only does the defect in question affect the power of speech, but it also extends to the act of writing. The person may articulate fluently and rapidly, using strange words that he has coined, or substituting unsuitable words. He may even know that he is talking nonsense, yet when he attempts to express his ideas by writing he will either write his words in conformation to his use of them or he will write an unintelligible scrawl.

Among other odd examples of this defect is one related by Professor Hammond, in which the person always made the answer *tois* to any question implying the use of figures, though he would correct himself by holding up the right number of fingers. For example, if he meant two, he would say *tois* and hold up two fingers; if he meant seven he would say *tois* and hold up seven fingers; if he meant eighty-four, he would say *tois*, hold up eight fingers and then four. Another gentleman could not recollect the names of his friends, but always designated them by their age.—*Scribner.*

Novel Cures.—The world is full of new cures, and of course they must pay or they would not multiply as they do. We have the water cure, steam cure, botanical cure, lifting cure, grape puncture cure, the spirit cure and infinitesimal pill cure, among others; and although each may have some decided merit in special cases, and the old system of allopathy may be shockingly misapplied frequently, still the main basis of success for most of the new cures must be ignorance and credulity. We often hear statements which we know to be false about the healing of serious diseases, and we are told that abroad remedies are extensively purchased, and that charlatans have large practices. Yet, in spite of all these things, or perhaps with their assistance to some extent, the science of medicine continues to advance.

These ideas suggested themselves to us upon reading that an ozone cure has been started in Germany, and great claims are made for it. Ozone, a peculiar condition of the oxygen of the atmosphere, is said to be a remedy for a multitude of diseases, including cholera, gout, and certain forms of fever and rheumatism, which diseases set in only when ozone is lacking. It is also an antidote for such poisons as prussic acid and strychnine. The method of application has not been made public, so far as we know; and we do not attach much faith to the new cure. But if the opinions and observations published by prominent scientists are correct, ozone deserves very careful study. It is said that the atmosphere at San Francisco has an exceptional large proportion of ozone.—*Alta.*

A Remarkable Cure—Skin Grafting.—One of the most remarkable cures on record has been nearly effected upon the person of Miss Hattie Thomas, of Waterbury, Ct., who was scalped in a button manufactory over a year ago, from the nap of her neck to her eyeballs, so that the skull was laid bare. Death was expected, and almost hoped for, as the only relief which could come to her; but the doctor noticing that she rallied from the first prostrating effects of the accident, determined to experiment with the French process of "skin grafting," and after the head was brought into a healthy state of suppuration he made the first attempt, taking the "seed skin" from the patient's arm. The result was admirable, but exhaustion was induced by the new wounds, and a supply of skin had to be taken from other sources. The nurse of Miss Thomas kindly volunteered. The doctor, delighted with his success, applied the knife to his own arm, and many young lady friends came forward and sacrificed portions of their own bodies for the salvation of their suffering sister. Over 150 separate pieces made up the new scalp, and Miss Thomas has souvenirs of her friends, much better than bedquilt blocks or even locks of hair.

Antidote to Liquor Poisoning.—The physician in charge of the Druukard's Department of Blackwell's Island says that milk or eggs are antidotes for liquor poisons, and those who must drink liquor should mix milk or eggs with their "poison," which will take effect on those articles instead of the toper's stomach.

Action of the Gastric Juice on Calomel.

Professor Tueon has been experimenting upon the effect of the constituents of the gastric juice upon mineral substances, especially those employed as medicines; and for this purpose prepared, first, a mixture of calomel and distilled water containing two per cent. of hydrochloric acid; second a mixture of calomel, pepsin, and distilled water; and third, a mixture of calomel, pepsin, and distilled water containing two per cent. hydrochloric acid. These mixtures were placed in glass vessels, and kept at 100° F. for twenty-four hours, being shaken occasionally. They were then thrown on to filters, of Swedish paper, and the filtrates saturated with hydrosulphuric acid.

The filtrates from experiments numbers one and two remained unaltered, while number three yielded a black precipitate of sulphide of mercury. These experiments, therefore, show that neither dilute hydrochloric acid (two per cent.) nor pepsin, alone, is capable of dissolving calomel, but that when these agents are mixed they do effect its solution, and, consequently, that the digestion of calomel, so far as its solution in artificial gastric juice is concerned, is brought under the same conditions as that of the albuminoids.

These observations are of considerable importance, as illustrating the method by which calomel enters the circulation, so as to exercise the various therapeutical effects which it exhibits.—*Harper.*

Vaccination and Revaccination.—The following statistics are probably the most reliable and instructive of any of the kind ever published, and are well worth heeding. From an official report made on the subject, it appears that in the army of Bavaria revaccination has been compulsory since 1843; and from that date until 1857—a period of 14 years, not a single case of unmodified small-pox occured, nor a single death from the disease. Of the nearly 50,000 revaccinations in the Prussian army, only about one-third were perfectly successful—resembling, that is, the result of a primary vaccination so closely as scarcely to be distinguished from it; and the remaining two-thirds being more or less modified, or failing entirely. In connection with these facts, the statement is also made that the distinguished English vaccinators—Dr. Marson, in 40,000 vaccinations; Dr. Sveese, in as many more; Sir Wm. Jenner, in the cases of 13,000 sick children and adults in London; and Dr. West, of the Children's Hospital, in to 26,000 children—all concur by saying that they have never seen any other disease than that of vaccination communicating with the vaccine.

A Hint to Housekeepers.—The main amount of injury done to the tender stomache of young children, invalids and sedentary persons, by eating bad bread day after day from one year's end to another, must be enormous. A cook who cannot make good bread of every description ought not to be allowed house-room for an hour; and that mother is criminally negligent, whatever may be her position, who does not teach her daughter to know what good bread is and how to make it. Alum is used to give whiteness, softness and capacity for retaining moisture. Lime could be employed with equal effect, having the advantage of correcting any sourness in the bread or stomach; besides affording an important ingredient for making the bone strong. Every housekeeper should know how to make two or three kinds of bread.

Ben of Glauber's-Salt.—A deposit of Glauber's-salt has lately been discovered in the Caucasus, not very far from Tiflis. In sinking a shaft the experiments penetrated a bed of pure Glauber's-salt to a depth of five feet, with a probability that the thickness was much greater. In the same region there are various lakes filled with solutions of Glauber's-salt, which furnish the apothecaries of that neighborhood with what they need of that substance, as it crystallizes in perfect purity along the edge of the water.

To Remove Warts.—Take good indigo, such as is used by the laundress, soak it in water; with a knife pare away the surface of the warts so as to cause the blood to flow. Wipe off the blood and drop the indigo water on them. Very large ones may require a second application. The indigo produces no pain whatever. I have used and recommended this cure to many persons, and have never known it to fail but once.—*Rural New Yorker.*

For Hysterics. — Carraway seeds, finely pounded, with a small proportion of ginger and salt spread upon bread and butter and eaten every day, especially in the morning and before going to bed, are successfully used in Germany as a domestic remedy against hysterics.

Poison from Locusts.—Three children were found dead under a mulberry tree in Lebanon, Ind., a few days ago. They died from the effects of the poisonous matter deposited in the berries by locusts.

A New Cause of Cancer.—The physicians of New York report an alarming increase of cancer on the nose, caused by the practice of wearing eye-glasses that are held to the bridge of the nose by a spring.

MINING AND SCIENTIFIC PRESS

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY, W. B. EWER, GEO. H. STRONG, JNO. L. BOONE.

Office, No. 338 Montgomery St., S. E. Corner of California St., diagonally across from Wells, Fargo & Co.'s.

SUBSCRIPTION AND ADVERTISING RATES.

Advertising Rates.—1 *week.*	1 *month.*	3 *months.*	1 *year.*
Per line..... .25	.80	$2.00	$5.00
One-half inch.....$1.00	$3.00	7.50	20.00
One inch..... 2.00	5.00	14.00	38.00

Large advertissments at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper, inserted at special rates.

Subscriptions payable in advance—For one year, $4; six months, $2.50; three months, $1 25. Clubs of ten names or more, $3 each per annum. $5, in advance, will pay for 1½ year. Remittances by registered letters or P. O. orders at our risk.

English and Colonial subscriptions, post paid, per year, £1 3s.; 6 months, 12s. Advertissments, per line, first insertion, 1s.; subsequent insertions, each, 8d. Large advertissments at special rates.

Illustrations and Reports of Mining Enterprises Wanted.—Drawings or photographs of mining works that are of general interest to our readers are solicited for publication in this journal. Official reports of Companies, and description of mines of importance, of special interest, are also desired. Sketches of any new method and discovries will be very acceptable.

San Francisco:

Saturday Morning, Aug. 10, 1872.

Gold and Legal Tender Rates.

San Francisco, Thursday, August 8, 1872.—Legal Tenders buying, 87; selling, 87½. Gold in New York to-day, 115½.

Table of Contents.

ILLUSTRATIONS.—Bassett's New Smelting Furnace; Hofmann's Quicksilver Elevator, Page 81. The Tulip, 88. The Diamond; The Cotton Pest, 89.
EDITORIALS.—Academy of Sciences; New Quicksilver Assay; Railway Speed, 81. The Hard Woods and Fancy Woods of California; The Diamond Excitement, 88. Fruit Food, 89.
CORRESPONDENCE.—Notes of Travel in White Pine County, Nevada—Continued, 82.
SCIENTIFIC PROGRESS.—The Theory of Fermentation; Comets and their Tails; Seeley's "Extract of Hops;" Astronomical Researches; Hydro-Electric Cables; Burning the Diamond, 83.
MECHANICAL PROGRESS.—Iron vs. Steel; Silvered Steel Cutlery; Plaster as a Protection from Fire; Architecture—Ancient and Modern; Drilling Glass with Emery; Cutting Marble; The Bank's Furnace, 83.
MINING SUMMARY from various Counties in California, Nevada, Colorado, Montana, and Utah; Mining Shareholders' Directory; Stock Report, 84-5.
DOMESTIC ECONOMY.—Good Receipts not all that is Needed; Items for House-Keepers; Cooking Spinach; Home-made Candy, 90.
USEFUL INFORMATION.—How to Destroy Mosquitoes; American Soda-water; Teeth in Young Sturgeons; Origin of Pearls in Oysters; Metallic Soap for Canvas; Science Perfecting Swimming; To Remove Tar, Turpentine, etc., from Objects; Coal Transportation, 87.
GOOD HEALTH.—Aphasia; Novel Cures; A Remarkable Cure; Action of the Gastric Juice on Calomel; Vaccination and Revaccination; A Hint to Housekeepers; Bed of Glauber's Salt, 87.
MISCELLANEOUS.—Artesian Wells in Idaho, 82. United States Mining Laws and Regulations Thereunder, 86. New Incorporations; Mining Discoveries; Mining Sales, 89.

Æsthetics.—Received of Payot, Upham & Co. a book, treating of the science of æsthetics, on the nature, kinds, laws and uses of beauty, by Henry N. Day. We know of no science, profession, trade, occupation or pursuit in which man is employed, that would not be rendered more engaging, interesting and attractive by a perusal of this work; so that every man and woman in the land should read it. An extract from the author's preface will be found under head of "Mechanical Progress" in another column.

Shipping Cinnabar to China.—A contract has been entered into with parties representing the Keystone and other quicksilver mines in San Luis Obispo county, for 1,000 tons of cinnabar, to be delivered for shipment at $50 per ton, to parties in this city. The ore is to be sent to China.

The Marysville *Appeal* speaks of a new and promising gold-bearing ledge having been discovered in Jim Crow Cañon. Indications of the same ledge have been found on the point between Downieville and the south fork of the north fork of the Yuba.

The mill of the Eliza Mill & Mining Co., in Siskiyou county, Cal., which was destroyed by fire on the 28th ult., as mentioned in our last issue, is being rebuilt. The loss was entirely covered by insurance.

Quicksilver Discovery.—Another promising vein of cinnabar is reported as having been found in the range between Napa Valley and Santa Rosa.

The Hardwoods and Fancy Woods of California, Mexico, and the Islands,

THEIR GREAT VARIETY, THEIR SPLENDID COLORS, AND THEIR USES.

Lumber is one of the first necessities of manufacturing industry—lumber in abundance cheaply obtained, found at places easily accessible from shipping ports, and of sufficient variety to supply the multifarious needs of the present day. California, and all the Pacific coast, has been particularly favored in this regard, the great Cordillera, the Sierra Nevada, and their multifarious systems of crossings, chains and spurs, may still be regarded as one vast system of forests, of woods, the trees in some of which, date back to a period anterior to the rise of mighty Rome, when the people that raised the grand monuments that cover Egypt were yet in their prime, ere Assyria, Persia or Greece, before the civilization of the Aztecs and the Peruviane, nay, probably prior to the advent of the Red Man to this continent. Abundance of lumber for all ordinary purposes has been since the foundation of the State drawn from these sources, yet we have never been able to obtain hardwood sufficient for our wants, and it has been often rashly conjectured, and still more rashly asserted, that we possessed none in our forests, and would be forever dependent on the East for our supplies. We have, in fact been thus dependent for the last twenty-five years, and being obliged to thus import, has been one of the greatest

Obstacles to Manufacture.

The coachmaker, railroad car, wagon maker has had to wait six months before he could obtain supplies by way of Cape Horn, and then he was obliged to submit his convenience to the caprice or necessities of the exporter at New York. Very often when he wanted a particular kind of lumber, he could not get it, and he never could supply himself with the variety necessary to the successful carrying on of a business, which at first limited in scope, was, as is always the case under similar circumstances, remarkable more for the variety and incongruity of the orders received in it, than for anything else.

The Loss to the State

Amounted to millions of dollars, within the last ten years. Last year there was used in San Francisco, $744,650 worth of Eastern lumber in various manufactures, divided as follows: Fine furniture, $346,260; carriage and car making, $200,000; picture frame making, $50,000; barrel, cask, keg, etc., making, $100,000; billiard and bagatelle making, $28,000; turned and carved work, $10,000; ship block making, $10,000. During the last ten years not less than $5,000,000 has been lost to the coast in this way from the city alone, and if we include the wagon making, etc., of the whole Pacific Coast, it will not be less than $10,000,000. But this is not the only lose.

The Import of Wagons and Fine Furniture

Is fully equal to the amount of the local manufacture, very probably greater, and if we had all the lumber we wanted, ready to hand, all this could be saved to the city and Coast. The manufacture of farm wagons used to be extensively carried on, now it has nearly altogether ceased, and almost every day we receive overland by rail, one, two, sometimes four cars of farm wagons. Between carriages, wagons, and furniture, we import $1,500,000 yearly, this going on for ten years, would aggregate a loss to the Coast of $15,000,000, which added to the loss in imported material would give a total of $25,000,000. The idea of

Experimenting

On the woods indigenous to the Lower Coast, the Islands, and Mexico, so as to obtain substitutes for the hardwoods and fine fancy woods of the East, has long been present to the minds of many of our most enterprising manufacturers, but it is chiefly to the gentlemen who manage the Kimball Car Company, that is due the credit of showing what a wealth and variety of lumber, useful for all purposes of manufacture and highly ornamental, we possess on this Pacific Coast. They first made known the fact to the world, in the splendid assortment of woods that they used in building the justly celebrated Palace Car, destroyed in the great fire of Chicago, and they are now, and have been for a long time past, engaged in making a series of experiments testing the adaptability of the hardwoods of Mexico and the Lower Coast, to purposes of carriage body, carriage wheel, and wagon manufacture.

The Woods

Are of upwards of fifty different varieties, of which we purpose here to mention the principal. We begin with some new to our manufacturers, well known Californian and Oregon woods. The Oregon oak is a splendid hard wood, and can be used for a great variety of purposes, such as making barrel staves, etc. It has not as yet been sufficiently tried for carriage and wagon stock.

Spruce is being sold to car makers and is taking the place of white wood. It sells at $40 per thousand.

The madrona is useful for many purposes especially for mill work.

The California maple can be used for nearly all kinds of manufacturing purposes, especially for those of furniture manufacture. It can also be used for wagon axles.

The California laurel is one of the finest species of lumber in America. It takes a most beautiful transparent polish, exhibiting a series of most graceful wavy lines. It is specially adapted for furniture, manufacture, ship building and for veneering.

The Cocobole which is found in large forests, near the coast, about Acapulco in Mexico, is a beautiful purple wood, and takes a high polish. It is also found in Lower California.

The Spanish cedar is also found in Central Mexico, and is a fine wood for furniture manufacture. It makes beautiful counters. It can be laid down here at from $40 to $75 per thousand feet.

The Prima Vera is, too, found near Acapulco. It is of a light color, much like maple and like it takes a high polish. It can resist the effect of the greatest heats without splitting. It is peculiarly suited to the manufacture of car panels.

Tomano or perfumed wood, so called from its fragrance, grows back on the hills of Central Mexico. It is of a white color outside, and is leather color inside. It is used for the manufacture of glove boxes. An oil is extracted from the tree and from the nut. Only logs have as yet been brought to this city, where they are laid down at ten cents per pound.

The Coha wood, Sandwich Islands, is of a dark brown color. It takes a very pretty polish, and has been used for making counters and for finishing library work. It is well adapted for furniture and ship building. It can be laid here at $80 per thousand feet.

The Coffee wood is found in the peninsula of Lower California and in the State of Sonora. It is very hard and heavy, fine grained, and of a light color. It is finer and tougher than hickory, and is well suited to making carriage spokes, but not to general carriage or wagon work, as it is too heavy. It is sold here at ten cents per pound.

The Ebony is a fine, hard grained Mexican wood, of a whitish or yellowish color. Enough of this has not been brought to this city to test its value for carriage stock, etc., but it has been used in the manufacture of knife handles.

The Mountain Mahogany is found in Lower California and also in the northern portion of this State, back in the mountains. It possesses all the qualities of other mahogany and is suited to the manufacture of furniture. It sells at $80 per thousand.

The Mesquite, growing in this State and in Lower California has been used successfully by the Kimball company in the manufacture of carriage hubs, and is said by them to be the best yet used for that purpose, as it will stand any heat.

The Oquihilado, Mexico, is a dark, solid, heavy wood. It is too heavy and tough for carriage work, but is suited for sieves, journals, mills, etc. It has been used in lieu of grindstones and wears as well as steel.

The Tiger wood of Mexico, is a strong, heavy wood like iron wood or *lignum vitæ*, and is, like the preceding, too hard for general carriage work. It can be used, though, for finishing purposes. It derives its name from its color, which is variegated and striped, making a polished section resembling the coat of the tiger or zebra.

The Tecamato is also found in Mexico. It is a hardwood of a light color, but not much is known about it.

The Chililo, Mexico, is a hard dark wood as yet almost untried the only use to which it has been put, being that of turning knife handles.

The Cabo de Hacha, Mexico, is a very hard wood, and is very high colored, being almost of a royal purple. It has not yet been sufficiently tested, but has been used for gears of wagons.

The Lance wood is found on the Lower Coast and in Central America. It is the best wood for buggy poles that has yet been found, but enough of it cannot be had here. It costs 10 cents per pound.

The Lina Fuerta is very heavy, and is of a yellow color. It has not been yet tested as to its adaptibility for carriage stock, but walking sticks have been made from it.

Rosewood is another of these Indian woods. It is in adaptibility very similar to Mesquite.

An Export to England

Of many of these have been going on for some time past. The Cocobole and Spanish Cedar is sent there in ship loads at a time, as also is the Tomano or Perfumed Wood, which is there very extensively used. It is certainly strange that the English living so many thousand miles away should be the first to pioneer the lumber wealth almost lying at our doors.

It will be seen from the sketch, that we possess

Hardwood Lumber for Manufacture

In almost endless variety, and that we need no longer depend on Eastern importation. We have yet to find out the thousand uses to which they are applicable. Everything necessary for carriage stock has at length been obtained, save only wood for felloes, in which nothing as elastic as hickory has yet been discovered. The only obstacle to the extensive uses of these woods in manufacture proceeds from the indolence and anarchical character of the Mexicans, which renders it difficult to obtain them in sufficient quantity. But California enterprise will not be long without finding a way of overcoming this obstacle.

The Diamond Excitement.

The excitement with regard to the reported discovery of diamonds in the vicinity of northeastern Arizona is still kept up, under the influence of sensational articles which are constantly appearing in the San Francisco dailies. Two additional companies have been formed with millions of capital (on paper), one in this city, and the other in Virginia City, Nevada, each of which proposes to send out prospectors the present season. Conflicting claims are also set up to prior rights of discovery, etc.

With regard to the latter, we very much doubt whether either of the conflicting parties have ever been within hundreds of miles of the location made by Mr. Janin, for Roberts & Co. The evidence, so far as it has any weight at all, goes to show that there is an extensive region of country, dotted over with a deposit containing precious stones, located much like the deep gold-placer diggings of California, only that in this instance the deposits are very shallow.

We are assured on very good authority that the Roberts Company will not send out any new party until next spring. The parties already there will remain, if circumstances will permit, otherwise they will return before winter sets in. We are assured that the diamond fields located by Roberts & Co., are in the midst of a mountainous country and covered with snow during several of the winter months.

Our advice to intending prospectors is to wait until spring. The chances are that any parties who start out now will be compelled to return for a new start in the spring. If any reliance is to be placed on the reports already received, there will be room enough and to spare for all who may wish to go for several years to come, and those who wait for the information that will be brought back by the first returning prospectors, will reap the cream of the thing, if there really is anything valuable to be found there. Of course there will be a few who will brave any danger or hardship, to be the first at the diamond fields; but none except experienced mountaineers should think of being of that number.

Burning of the Erie Railway Shops.—A fire occurred in the Erie Railway shops, in Jersey City, on the night of the 24th ult., which destroyed the entire shops of the company. There were thirty-three engines in the repair shop. An immense quantity of tools, machinery, patterns, etc., were destroyed. The loss is estimated at about $300,000. The building will be immediately rebuilt.

The Millerton *Expositor* gives some particulars of the discovery of a very rich gold-bearing ledge, near Sycamore creek.

A New Cotton Pest.

Editors Press:—I enclose yon specimens of fly which is doing serious damage to the cotton crop of this vicinity, and as they are new to me as well as to others, would like your opinion of them.

Their depredations are not on cotton alone, but on everything that puts forth a tender bud; even the oak, ash, box elder, in fact, everything. They are particularly fond of sour clover and alfalfa. I have 12 acres of alfalfa with scarcely a bloom, and no seed. I first noticed them on the Irish potatoes in May by seeing the buds droop.

They are inclined to be sluggish, and when you approach them will dodge under the leaf. I have been told by a Mexican that he has seen them in Mexico, but they only appear in 8 or 10 years. Yours truly, J. M. Strong.

We herewith give our readers an accurately drawn illustration of this insect pest which threatens serious injury to the cotton crop in California. It is enlarged to three times its natural length and width. For an entomological examination we referred the insect to Mr. C. H. Dwinelle, of Oakland, who reports to us as follows:

I have examined the insect which Mr. Strong sent you, and am sorry to say that I have not been able from the books at my command to determine their species. They belong

to the group of insects known to naturalists as the Hemiptera. The name means half-winged, and is descriptive of the appearance of the upper wings, half of which appear to be solid and the other half transparent. The mouth parts are formed into a sucking tube, which is easily seen in the specimens sent by Mr. Strong, and also in the common squash bug.

From descriptions and cuts given in some of the works on insects, the pest which is troubling our cotton plants must be closely related to the Chinch bug, which is often so destructive in wheat fields. It does its mischief by sucking out the juices which should go to nourish the growing parts.

The insect in question is a true *bug* and not a *fly*.

If Mr. Strong will send me a number of the bugs, enclosed in a small vial of alcohol, I shall be glad to send them to professional naturalists, who may be able to give information that would be interesting and perhaps useful.

Fruit Food.

With all the increase of nurseries and orchards throughout the entire of the Atlantic States, good fruits are worth more now than they were twenty years ago. There is a great deal more fruit eaten, systematically eaten with nearly every meal, summer and winter, either unprepared or canned. As a consequence there is a positive and growing interest in the production of fruits, and as the object possesses pecuniary interests to most growers, they are taking care to cultivate the best varieties.

But as an article of food, fruits are now considered as essential to a really proper diet, taking rank with bread and vegetables; and if less meats were used and their place supplied with fine fruits, it would promote the general health of the people and particularly in all hot countries and climates. We overtax the digestive powers by eating too much solid, concentrated food. For the heavy meats substitute more ripe fruits, or if not ripe, then let them be thoroughly cooked.

Arbitration Courts for Labor.—A Good Idea.—At last there is a probability of a settlement of the trade disputes in Berlin, which have caused so much suffering and so lengthened cessation from labor. Permanent courts of arbitration, to which all matters of disagreement between employers and workmen are to be referred, will, it is hoped, prevent future strikes by removing their cause. The establishment of such courts in all large centers of population might be made productive of a vast amount of good, both to employers and employed, if they could be so organized and conducted as to secure the confidence of the community.

Utah Items.—A dispatch from Salt Lake dated the 3d inst. says that over $300,000 worth of refined silver bullion had been received there from the mines during the week. It is said that a company of Cincinnati capitalists are investing a large amount of money to work mining property in Tintic district.

The Diamond—No. 1.

The recent discovery of diamonds on this coast, and the consequent excitement with reference thereto, renders any information with regard to these gems of particular interest just at this time. With this view we propose to give several articles which will embrace all attainable information with regard to the circumstances under which they are found, the mode of searching for them, the way in which they are placed upon the market, the manner in which they are cut, how they are valued, etc.

How the Diamond is Cut.

Passing over, for the present, the mechanical appliances by which the work is done, we will state that diamonds are cut in four different shapes: the brilliant, the rose, the table and the brilliolette. The two latter have pretty much entirely gone out of fashion, and need not be described here. The rose is flat on the under surface, and cut into innumerable facets on the upper. This form is also rarely seen in this country. The form most commonly employed here is the brilliolette or brilliant. Ninety-nine out of every hundred diamonds sold in the United States have that shape.

The form of these gems may be fully understood by referring to Figs. 1, 2, and 3 which are accurate to size and form of the famous "Koh-i-noor," now belonging to the British Government. Fig. 1 represents the front or top view; Fig. 2 the back or bottom view; and Fig. 3 a side view, showing the thickness or depth of the jewel.

The proper shape of a brilliant should be nearly that of the small figures here shown, illustrating the various sizes of diamonds, from 1 carat to 10 in size; the corners should be a little more rounded than shown, but not so much as the Koh-i-noor. If Figs. 1 and 2 of that gem are carefully examined it will be seen that the outline is not regular; it presents neither a perfect circle or oval, nor are the corners uniformly rounded off as shown in the smaller engravings of the various carats. This irregularity is what is referred to by experts when they speak of that famous gem having been spoiled in the cutting.

Fixed laws govern the proportions of the *brilliant*. Thus a diamond of 1 carat should have its diameter, as shown, of about ¼ of an inch, with a depth of rather over ⅛ inch, shown by the straight line underneath. The facet in the center of the top should also have its due proportion to the full diameter of the gem, as also should the center facet on the bottom, which is reduced, in the single carat to almost a point. These bottom facets are represented by the small dots, found under each of the graded sizes, as shown from 1 to 10.

These relative proportions may be more fully and distinctly studied by referring to Fig. 3 where the top facet, the greatest diameter (or "girdle," as it is technically known) and the bottom facet are distinctly shown.

If the diamond will not admit of bringing out the perfect proportions, any variation therefrom detracts from the value of the gem. Jewelers often try to conceal the thickness of the gem by the setting. Any such attempt is a cheat.

How the Diamond is Valued.

The value of the diamond depends almost entirely on the circumstances connected with its appearance, such as beauty, uniformity, the play, lustre, vivacity of colors, etc.; also on the perfection of the cut, polish, etc. A perfectly limpid diamond is worth about twice as much as one which is even very slightly tinted; while those which approach to opaqueness have no value for brilliants, and are used only in the mechanical arts. Their transparency and clearness are divided into three degrees, as follows: Of the first water—those which are free from the slighest fault; the second water—which though clear and limpid, are marred by dark spots or clouds; of the third water—those which have a slight tint of any color, or which though limpid, have material faults.

FIG. 1.—THE KOH-I-NOOR—FRONT VIEW.

FIG. 2.—THE KOH-I-NOOR—BACK VIEW.

FIG. 3.—THE KOH-I-NOOR—SIDE VIEW.

In order to determine readily the character of a diamond, it is well to breath on it, whereby it loses for a moment its lustre, when the eye can more readily distinguish its faults. The genuine diamond also becomes clear much sooner than the false.

The gems are sold by weight, as carat and grains; 1 carat is equal to 4 grains, and 44 carats are equal to one ounce. The name carat is from *Kuara*, the coral tree (erythrima), the red pods of which, when dry, were formerly used for weighing gold dust. Each of these pods weighs 4 grains, which is therefore equal to one carat, or, as it was formerly spelt, karat, to conform more nearly to the spelling of the plant.

A brilliant, properly cut, of one carat weight, is worth in Paris from $60 to $70. In the United States, it would be worth from $100 to $125. Extraordinarily pure and brilliant ones are sometimes sold for $150.

Diamonds below one carat in weight, are worth at the rate of about $60 in this city; that is, a half carat diamond is worth $30; a quarter carat, $15, etc. When they are so small as to require eight or ten to make a carat, the ratio of price increases by reason of the extra cost of cutting the number of gems required to make the carat.

The price per carat advances in rapid ratio as the diamond increases in size. A brilliant of the first water which weighs one carat is worth, say $125; one weighing two carats is worth $500; one weighing three carats is worth $1,125. The calculation of the value is made by first multiplying the weight into itself, and the sum obtained multiplied again by the price of the carat, as follows: For the two carat gem, 2×2×125=$500; the three carat gem—3×3×125=$1,125, and so on indefinitely.

This calculation, however, does not always hold good after the brilliants exceed ten carats. Fancy, scarcity, demand and other circumstances come in at this point which usually unsettle any fixed rate of calculation.

Rough diamonds, unfit for cutting, and such as are used by glass-cutters, etc., are worth from $10 to 15 per carat; smaller ones, such as are used by lithographers for etching, etc., are worth still less per carat. Black diamonds used for drilling, as in the diamond drill, used for mining and quarrying purposes are worth about $16 per carat. Thus every diamond of whatever character, or however large or small, has its value, and commands a ready sale.

The sizes of the diamonds, from 1 to 10 carats in weight are very accurately given in the accompanying illustration.

The diamond is sometimes of such a form that it can only be cut into what is called spread diamonds or flat stones, so as to display a large surface, which are sold much cheaper, per carat, than those of the regular cut.

New Incorporations.

Big Cottonwood Tunnel and S. M. Co.—Aug. 2. Location: Big Cottonwood District, Salt Lake county, Utah. Capital stock, $500,000, in 50,000 shares. Trustees—Robert Sherwood, Chas. F. McDermott, N. T. Green, Wm. Burling and Smythe Clark.

Weske Gravel M. Co.—Aug. 2. Location: Placer county, California. Capital stock, $500,000, in 5,000 shares. Trustees—Adolph Weske, Frederic Clay and John James Miaburn.

El Dorado Independence Quartz M. Co.—August 5. Location: El Dorado county. Capital stock $4,800,000 in 24,000 shares. Trustees—Jacob Nagler, James S. Houseman, Seixas Solomons, J. A. Pennell, Wm. Holden, Daniel McLeod, R. W. Simpson, E. B. Warsaw, and Samson Rosenblatt.

Original Diamond Discovery and M. Co.—August 5. Object: To mine for diamonds and gold and silver in Arizona. Capital., $10,000,000, in 100,000 shares. Trustees—W. I. Kipp, Jr., Charles Hosmer, M. D. Townsend, Robt. Sherwood, E. J. Elsey, Seth Cook and Jos. Freneh.

Pacific Coast Gas and Water Company.—Aug. 5. Object: To manufacture gas to light streets and buildings, and to supply water in the towns of the Pacific Coast. Capital stock, $2,000,000 in 20,000 shares. Trustees—E. B. Mott, Jr., N. G. Kittle, Robt. Watt, R. A. Swain, J. W. Stow, Maurice Dore, Alex D. Bell, Jos. D. Sedgley, Chas. Lux, W. W. Montague, Albert Miller, O. W. Childs, W. W. Dodge, S. N. Putnam, August Hemme, C. T. H. Palmer, John Jackson, H. B. Clayson, E. C. Boobar, E. B. Rall, Geo. Cadwalladar, Jno. Bidwell, S. Sweet, A. Horton and Chas. Fernald. The company have in contemplation the immediate erection of gas works in Sacramento and Stockton, for which franchises have been already obtained.

Mining Discoveries.—The Reno *Journal* mentions having seen some fine specimens of silver ore from the Poe mine, which was recently located on the Peavine mountain a few miles to the north of Reno. The ore assays from $73.70 to $102.09. Active operations on the ledge will shortly be instituted and if satisfactory a mill will be erected.

The Denver *Tribune* has seen one of the party who went to the new San Juan District, in Colorado, the last of April. The gentleman referred to says the entire distance from Santa Fé, New Mexico, from which place the party started, is 290 miles. Up to the time of his departure a number of arastras were running, and his reports of the richness of the country are very glowing. The *Tribune* says he is a gentleman of intelligence and perfectly reliable, and hazards the conjecture that in all probability, the mines will turn out as wonderful and productive as any the world has ever known. Numbers of prospectors are now thronging to the new district and a quartz mill is now on its way thither. We shall look with interest to further developments in this new gold camp.

New Silver Mines in Nevada.—Maj. Robert M. Goldman reports a new discovery of silver ore of great richness in the Silver Zone Dist., situated about twenty miles due south of Toano, a station on the line of the Central Pacific Railroad, in Elko county, State of Nevada. Quite a number of ledges are said to have been discovered, one of which has been named the Monster Ledge, on account of its large size, being twelve feet wide on the surface, and has been traced already fifteen hundred feet.

Mining Sales.—A half interest in the New York Hydraulic Co's claim, on the La Porte road, about 30 miles from Marysville, has been sold to J. Gibson, for $16,000.

The Salt Lake *Tribune* has been informed that Messrs. Walker Bros. have bought extensively into the Caledonia mine, in Little Cottonwood, Utah.

The White Pine *News* says that Col. Lewis and other Californians have purchased the De Mill mine, a series of seven locations on Schell Creek District, Nevada. The price was $48,000. A water privilege was also bought, and a 20-stamp mill is to be erected.

Improved Treatment of Copper Ores.

Among the patents issued June 25th, we notice an invention by C. M. T. Du Motay, of Paris, for an improved treatment of copper ores, which will be interesting in view of the newly awakened interest in copper mining. The patentee sets forth as followe:

It is well known that sulphuric and chlorohydric acids employed singly or together dissolve but little or not at all the sulphurets, and double oxysulphnrets of copper and iron containing or not containing gold, silver, lead, autimony, and arsenic.

It has been impossible heretofore to euceesfully treat these ores in a crude or roasted state either by sulphuric or chlorohydric acid or by a mixture of these two acids. The solutions or persulphate of iron alone, cold or warm, to dissolve these ores act slowly, and for this reason they cannot be successfully employed to melt the copper contained in the complex pyrites containing this metal alone or mixed with gold, silver, lead, antimony, and arsenic.

We have discovered a new dissolvent—positive and economical—of the ores of copper, carbonates, oxides, and double or multiple sulphurets, and also matte and black coppers containing or not containing gold, silver, lead, antimony, and arsenic.

This dissolvent—which has for its object to rapidly diesolve the sulphurete and oxysulphurets, and all other copper ores, roasted or not—is a mixture of persulphate of iron and chlorohydric acid, or, what amounts to the same, a bath of persulphate of iron, through which passes a continuous current of gaseous chlorohydric acid.

The iron, copper, antimony, and arsenic rapidly and entirely diesolve in this compound. The iron, copper, and antimony, dissolved first to a state of chlorid, finally return, in yielding their chlorohydric acid, to the state of sulphates, while the arsenic remains in solution in a state of chloride. The other metals, such as silver and lead, are attacked first by the chlorohydric acid, and fiually precipitated in an insoluble state in the form of sulphates. The gold, unattacked, follows them into the residuum, insoluble. This residuum, separate from the liquid part, is first roasted and afterward reduced, in the presence of lead, in the cupel. The liquid bath containing the sulphatee of iron, copper, and antimony, and the chloride of arsenic in solution is evaporated to dryness. During the concentration of the bath a part of the chloride of arsenic volatilizes, while the other part remains in the liquor.

The salts, after evaporation, are recovered by the water; the eulphate of antimony is precipitated to the state of subsulphate of antimony, nearly insoluble; and the chloride of arsenic remaining, paeses to the state of arsenious acid, likewise not soluble; while only the copper and iron remain dissolved in the liquor.

When, during the evaporation, all the chlorohydric acid hes not been expelled, and only the antimony and arsenio are left in a chloride state in the liquor, similar reactions to those before described occur—that is to say, the chloridee of arsenic and antimony recovered by the water after evaporation pass away, the first in a state of arsenious acid and the second in a etate of oxychloride, insoluble. The double sulphates of copper and iron remaining in solution are treated by means of metallic iron, which precipitates the copper by the prpcess of cementation. The protosulphuret of iron remaining is treated, in either a moist or hard state, by the oxygen of the air, or by a mingling of air, chlorine, or nitrous vapors, which brings it to a state of persulphate. The peroxide of hydrated iron remaining insoluble from this operation is separated by decantation end set aside. Subsequently treated, and dissolved by sulphurous acid in connection with air, it produces sulphate of peroxide of iron, which eerves to replace the quantity of sulphate lost in the preceding operations. In this manner the chlorohydric acid dieplaced by persulphate of iron, which serves the same pnrpose as the persulphate in the other operation.

It eometimee occurs that in the double liquid of eulphate of copper and iron a small portion of sulphate of silver remains insoluble. To precipitate to a metallic etate the silver contained in this sulphate we cause the reaction of plates of copper or lead, which adhere to the silver, and which we add to the residuum insoluble before being treated in the cupel.

Claim 1. The miugliug of persulphate of iron and chlorohydric acid, which constitute a new and positive dissolvent of the ores of copper, carbonates, oxides, and double or multiple sulphurete, likewise matte and black coppere containing or not containing gold, eilver, lead, antimony, and arsenic.

2. The reactions above described for obtaining in an insoluble state salts and precious metals contained in copper ores treated by our dissolvent.

3. The separation of the copper in a pure state and the removal of the antimony and arsenic.

4. The incessant regeneration of per-sulphate of iron and chlorohydric acid, constituting our dissolving liquor.

5. The employment of persulphate of iron with eulphuric acid in the same manner ae we have used chlorohydric acid.

Cigar Manufacture in San Francisco.

How few people think anything of the price of a cigar, or that the article itself, apart from its daily use, is a matter of importance. It is a fact, however, that in this capital of a land of wine, wheat, and gold, in manufacturing importance, the cigar is king. Lest yeer over 150 factories turned out goods to the value fully of five millions of dollars, and employed for a great part of the year upwards of three thousand persons. Day by day, the manufacturers are helping to swell these figures. In a few years more we ehall supply cigars to the whole of the United States. There are at present in full operation, and making returns to the internal revenue about 100 factories owned by white men and Chinese.

The Clandestine Manufacture of Cigars

In this city is carried on to a great extent, and we are credibly informed that there are hundreds of establishments where such business is carried on. The monthly returns made to the internal revenue, do not account for more than two-thirds of the cigars made in this city. Partnerships of three or four Chinese are formed who make small quantities, and dispose of them as fast as they are made. They buy the most common kinde of tobacco, make it up in any way, and thus undersell the regular manufacturers, and consequeutly can only furnish the most ordinary and common of cigars. It is to be hoped that the authorities will do their utmoet to break up this illicit trade. The clandestine establishments where these are made, swarm in the Chinese quarter; they are found everywhere from garret to cellar, and can of of course be cleared out, if danger looms, at a moments notice. It wae to break them up, that the large manufacturers had passed that provisiou of the revenue law, which destroys the trade in small quantities of leaf tobacco.

The Workmen

Employed iu the San Francisco cigar manufacture may now be said to be exclusively Chineee. Excepting the proprietors there are not more than fifty white men employed in the bueinese iu the city. The Chinese, it is said by manufacturere, seem to he born cigar makers, and they have a elenderness of fingers and a delicacy of touch almost essential to succese in the businees. When they come first San Francisco, they are apprenticed in one of the numerous Chinese factories, where at first they receive board, lodging and clothing, and afterwards in addition to that, about a hundred dollars at the Chinese New Year. After a year or so they are fitted to work in white factories. In theee latter tbey are classed as strippers, rollere and packers. Wrapper stripper, strippers' average, $4 per week; filler strippers, from $5 to $7; rollere, $8; and packers $11 per week. In the factory of Lewis & Co., uuder the new process, rollers average $12 per week, and looking over the pay sheet we saw one who earned $16.35 per week. This would be good wages for white men. The workmen in most of the factoriee are numbered, and are known by these numbers instead of their real namee. In general, they are physically, finely developed, are clean, tidy and industrious; though to this there are exceptions.

The Tobacco

Used is principelly Havana, and Connecticut, though some Pennsylvania is used for wrappers, but it gives the cigar a peculiar and not entirely agreeable flavor. The quantity used by the factories of thie city is not lees than two million and a half pounds a year. It would be a great boou to the State if tobacco culture could be carried on successfully. We could then he able to eupply the great and constantly increasing demand of our factories ourselves. Mr. Culp, of Gilroy, hae been for several years experimenting on the production of Connecticut and Havana leaf tobacco suitable for the manufacture of cigare, and at length claime to have succeeded. He has mede cigars at Gilroy of the tobacco produced off his own farm, and competent judges pronounced them first-class. But the cigar makers of thie city say that he has something to learn in the metter yet.

Synopsis.

The number of factoriee at present in this city is about one hundred and twenty, employing all the way from two to three hundred men each. Of these about 70 are owned by white men and the balence by Chineee. The number of men employed ie about three thousand, who make one hundred million cigars a year, worth about five milliou dollars. The trade with the Pacific Coast territories and with the East takes from one-third to one-half the total production. The business of cigar mannfacturing is the most flouriehing we have, and of its future development there is practically no limit.

Domestic Economy.

Good Receipts not all that is Needed.

Something more than good receipte are necessary, to make a thorough cook. Be patient and perseveriug, remembering that steady practice and an earneet deeire to succeed are indispensible in tbis department es well as in every separate division of household labor; and, united to theee, you will find that the ability to vary eomewhat the primary directions will often be equally necessary, requiring the good sense and judgment which ehould have been partially, at least, developed and greatly strengthened in those houre spent in study during your girlhood, which you are now so ready to feel were misspent and wasted.

It often happens that eome ingredient will he needed, and you did not discover the want of it until the article to be prepared was too far under way to make easy a change in the bill of fare for that day. To be sure you should not have begun until all all the necessary materials were laid out in order; but, having made the mistake, practice, experience, and a eufficient knowledge of the various articlee that can be substituted and properly combined in place of the missing one, will soon show you how to conquer difficultiee, end teach you how to releese yourself successfully from all such dilemmas.

But in all the new cases that will rise constantly, you will find many things to be taken into consideration,—certaiu general rulee will be understood; and, above all, good common sense and sound judgment must be called into active live to assist in the true application; a quick institutiou to show just where, and how much, it will be safe to very and modify the first directione given.

There are very few receipts that will not be the better for changee, which are often made necessary by the quality of the material you may be obliged to work with: If flour is dry, moist, or runny; if the sugar provee the best refined, or a second-clase; if eggs are fresh, or rather old,—all these points require good judgment, as well as autbenticated receipts. To follow the exact letter of a receipt always, may often iusure a failure. Besides, as in the agricultural and horticulturel world, a seedling may prove more desirable than the parent receipt.

To aesist, as fer as possible, in forming a correct idee of euch modifications as from time to time may be advisable, some general directions are very necessary. We occasionally meet one who from childhood has manifested a gift for household management, and more particularly for all that pertains to the mystery of cookiug, and for whom all rules and directions seem superfluous. Instinct ie apparently the guide, and whatever the band touches the result is euccessful. Yet, ask tbese favored onee for directions for any article which you know in their hands will be all right, and not once in a hundred times can they give you details that will prove at all eatisfactory.

We knew a housekeeper "out West," whose cookiug was never trusted to any hand but her own,—we mean her "company cooking;" "every day doings" were of little coneequence. Under her hand, her bread was alwaye the lightest, yet retaining the sweet, natural taete of the pure wheat perfectly,—never sour, never over or under-baked. Her piee, sweetened and flavored

> "So as not to mix
> Taste not well joined, inelegant, but bring
> Taste after taste, upheld with kindliest change."

Yet, judging from her own remarks, she never gave much heed to any receipts, having only a vague idea of the modes cooks employed; nor do we believe she ever weighed or measured anything, or could give another any distinct direction or idea of her manner of procedure in making the many delightful compounds she so skillfully prepared. No direction given by her could be followed, or any approximation to that which sprang from her magical touch reached.

"Do tell me how you made thet delicious cake."

"Oh I hardly know myself. Never made anything twice alike. I just throw certain things together, and somehow—why—they make themselves, I think. When I begin to make anything, I never have any clear idea of what will be the result,—only I am pretty sure it will be good."

"Why, you have just made this cake, and can't have forgotten! Please tell me exactly how you did it."

"Oh, take a little flour, just a mite of salt two or three eggs; beat them well, you know; throw in a lot of sugar, and a 'right smart chance' of butter, and milk enough to make it about right for stiffness. Dash in any kind of spice you like, and bake—well, eome time—you can always tell when a thing is done, you know easy enough."

Was not that brilliant and lucid explenation sufficient to comfort the heart and strengthen the hands of any young wife already at her "wits' ends" because ehe did not know how to do thiuge and make them good? Goiug to Mre.——, who was "euch a eplendid cook," becauee she thought she must be the beet exponent of the art, she listens, and finds it all "Greek" to her. In deep mortification and discouragement she feels that the coveted lesson has made "that darker which wae dark enough before," and returns to her household cares bewildered and disheartened, imagining herself the most stupid of beings. She never thought that directions about cooking could be so hard to underetand.

These eelf-taught, or rather instintive, cooks and housekeepers are the worst teachere for young folke. They never give an intelligible reaeon why they do thus and so. They do not realize that they give much thought to their work; it comee to them, or, ae tbis lady said, tbings do themeelves. They can no more tell how or why than precioue baby-singers; or wonderful boy-musicians can tell why they catch a tune or touch the right keye on the piano.

Take courage. For awhile you may find "perfecting yourself in all housewifely arte, uphill work," but no more than in your schooldays you fonnd in mastering French and Algebra. Now, ae then, patience and perseverance will win the day, guided by the stroug desire and good sense; and knowledge of any kind gained by one'e own courage and labor is far more precioue, and reliable than that which comee to you without exertion.

We do not like to see young housekeepers feel that if a girl marries and attempts to keep house, all tbe yeare spent in school were wasted, and the knowledge gained can in no mauner be used to aid her in her attempte to uuderstand her uey duties. Everything in your youthful studies that tende to etrengthen the mind, cultivate a correct mode of looking into and forming sound judgment about everything that passes nnder your observation, will come into practical use more iu the "tame commonalities" of the kitchen and cooking department, than in faehionable life or refined society. Practice must teach you many things which you cannot learn in the most elaborate cook hook; but a good solid education will do much toward interpreting all directious, and making your cares aud labore a eource of pleasure and solid enjoyment.—*Mrs. H. W. Beecher.*

Items for House-Keepers.—Do everything in its proper time. Keep everything in its place. Always mend clothes before washing them.

Alum or vinegar is good to set colors of red, green or yellow.

A hot shovel held over varnished furniture will take out white spots.

Ribbous of any kind should he washed in cold soap-suds and not rinsed.

If your flat-irone are rough ruh them with fine salt, and it will make them smooth.

If you are buying a carpet for durability, choose small figures.

Scotch snuff put on the holes where crickets come out will destroy them.

A gallon of strong lye put in a barrel of hard water, will make it as soft as rain water.

Cooking Spinach.—This ie far superior to all other greene. It is also very wholesome. Its quality as a dish, however, depende upon tbe cooking, and this is the way to do it: Having peeled and washed the spinach, put iuto a tin-kettle, without water, or only that which may remain after washing; put this kettle *inside* of another containing water. When tbe spinach is well *stewed*, not boiled, take it up and drain it without pressing ae that will make it tough and dry. Then cbop it smell, and add eome hard boiled eggs also chopped; eeason with pepper and good butter, mix it well, return to the kettle, and etew a quarter of an hour. It ie tben delicious. Some people eat it with oil and it is an excelleut addition.—*Germantown Telegraph.*

Home-Made Candy.—Use a new tin basin; put into it four tableepoone of water, one pound of "coffee A" sugar, one teaepoonful of good cream tartar; boil, stirring constantly to avoid burning. After it begins to have a soapy appeerance try it often by dropping a little cold water, and if done it will at once become brittle. Butter an earthen dish and pour the hot candy into it, that it may cool just enough to handle. Flavor to taste with oil of peppermint, winter-green, sassafrae or lemon. Two drope of oil will flavor it strong. For variety, divide into three or four parts and flavor differently by touching one kind of oil to each. Work in the bande at once; the more it is pulled the whiter it will get.

To Wash Silk.—Half a pint of gin, four oze. of soap, and two ouncee of honey, well shaken. Wet a sponge with this mixture and rub the silk, which should be epread upon the teble. Then waeh it tbrough two watere, in which put two or three spoonfuls of ox gall, which will brighten the colore and prevent their running. Do not wring the silk, but hang it up to dry, and while damp iron it. Tbe lady who furnishes this receipt says ehe has waehed a green eilk dreee by it, and it looks as good as new.

Cleansing the Hair.—The best substance with which to cleanse tbe hair is a teaspoonful or two of common spirits of ammonia in a basin of water. The scalp and hair should be thoroughly washed end rineed and wiped dry. A little glycerine dissolved in alcohol may theu be advantageously applied; all other oils will become stale, and are unfit for snch use. Barbere commonly use carbonate of potash in the water they employ for shampooing; but spirits of ammouia is better.

Pie Crust.—One cup sour cream; 1 cup buttermilk; soda sufficient to neutralize the acid; a little ealt aud flour; roll a little thinner than lard pie crust; it will not be "flaky" but light and delicious to one who hae more regard for health than for mere custom and fancy.

BURLEIGH
ROCK DRILLS
AND
AIR COMPRESSORS.
The Burleigh Rock Drills, which have stood the test of five years constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequalled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunnelling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground, or compressed air when under ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being applied.
Send for illustrated pamphlet to
BURLEIGH ROCK DRILL CO.,
FITCHBURG, MASS.

"Clear as Crystal."

PEBBLES ARE MADE from Rock Crystal cut in slices and ground convex, concave or periscopic, for Spectacles. In Europe and in the Eastern States they are superceding glass.
Among the advantages they have over glass are, that being susceptible of the HIGHEST POLISH, they transmit more rays of light, nothing having more transparency.
They are COOLER to the Eyes—a very important gain.
They are much harder than glass, and DO NOT SCRATCH.
The best quality of Crystal is found in Scotland and the Brazils, and is manufactured into lenses by the best workmen in England and France, for
Thomas Houseworth & Co.,
OPTICIANS,
No. 9 Montgomery street, Lick House,
Where they can be obtained, already fitted, in frames, or may be fitted to order.
Persons sending their Spectacles can have Pebbles inserted of the same grade as their glasses.
Illustrated Circular for style of frames sent to any address free.
☞ Pebbles sold as such by us, are Warranted.

NOTE.—The gross amount taxed for the quarter, for the Crown Point mine, amounted to $1,882,108.52; total tax derived to county for quarter, $27,321.62. The Caledonia, Silver Hill, Ophir, Bullion, Imperial and Overman have crushed no ore this quarter.

Gold.

The Production of the World.

Mr. Thomson Hanker, writing in the London *Economist*, expresses his opinion that the time has arrived for taking stock of the large increased production of gold in the world. I believed (he says) that during the last ten years the export of gold (exclusive of gold coin) from the Australian colonies has not been less than about 17,000,000 ounces, or equal to £68,000,000, and the gold coin exported from the same colonies would add about £20,000,000, making a total of uot far short of £90,000,000 Nor do I believe it would be disputed that the export from Australian colonies dnring the previous ten years—say from 1853 to 1862--was at least equal to that during the past ten years ending the 31st of December last; if so the total export of gold from the Australian colonies since the first discovery of gold cau not have been much less than £170,000,000 to £180,000,000, and if the export from California during the like period has been only £120,000,000, we have a gross total of not less than £300,000,000 of gold added to the stock of gold in the world siuce 1852–53. I have only reckoned the gold produced in Australia and California; the prodnction of gold iu other parts of the world previous to 1852 was considered, I believe, to be equal to from £3,000,000 to £5,000,000 value anually; if we only reckon it at three millions there will have to be a further addition of £60,000,000, so as to make a grand total of at least £60,000,000, and possibly considerably more to the gold already in the world before the discovery of gold in California and Australia. Now what can have become of all this gold? The use of gold coin in England has considerably increased, but I doubt very much whether the gold coin in circulation elsewhere than in Great Britain or the British colonies and dependencies was materially larger at the beginning of this year than it was in 1853. I have very little doubt but that you have the materials for ascertaining how much gold has been coined at the principal mints of the world during the last twenty years, and if you would give us this information you might be the better able to judge whether it is possible that such a large addition can have been made to the stock of gold in the world during twenty years without having very materially lowered its value, or, in other words, augmentcd the price of all articles which have usually been valued on a gold basis. I believe I am correct in saying that M. de Humboldt considered the quantity of gold which was poured into the European markets in 318 years, from the discovery of Hispaniola to the revolution in Mexico, at somewhat under £300,000,000. Is it possible, remembering the effect produced on prices by this enormous increase in the prodnction of gold during those 300 years, that a great effect must now be experienced by the additional production of an equally large amonnt during so comparatively a short time as tweuty years.

THE principle suggested by Tresca's experiments on the flow of solids has, we are informed, been applied in practice for determining the pressure produced in the bore of large guns. A cylindrical hole, bored into the gun, is filled by a block of lead, supported behind by a steel block, through which is a small cylindrical hole. When pressure acts on the lead, a portion of is is forced into the hole in the steel block. By estimating the volume of the lead found in the cavity after a discharge, a means of measuring the pressure exerted within the gun is given.

GAME PLENTY.—Mr. Isaac Cross, who is an old mountaineer and hunter, has been makiug a cruise out among the Sierra Nevadas. Mr. C. says that the indications of deer are numerous and predicts that that species of game will be nnusually plentiful here this fall and winter.

Leather Market Report.

A CALL UPON THE PACIFIC RURAL PRESS.—While at San Francisco we availed ourselves of the privilege of dropping in upon our friends of the PACIFIC RURAL PRESS, one of our most welcomed weekly exchanges. The firm of DEWEY & Co. has become a household word throughout the State, from the dignified and valuable character of their publications. These publications aim to meet the varied interests of California, and we are glad to know that they are all helng sustained generously. During our trip through the State we met at nearly every point one or other of their issues.

Besides the RURAL PRESS, they publish the SCIENTIFIC PRESS, which ably serves tho mining and other industrial intereate of the district.

Recently they have added a monthly sixteen-page newspaper of special interest to wholesale and retail tradesmen, called the PACIFIC COAST MERCANTILE DIRECTOR.

In all these enterprises we wish our friends abundant success, and we shall long remember their cordial greeting extended a stray editor sojourning a day or two in their beautiful city.—*Philadelphia Journal of the Farm.*

A NEW AMALGAMATOR has been invented by Mr. John Tunbridge of Newark, N. J. The machine consists of a cylindrical receptacle, eight inches in diameter and two feet high, divided within hy several perforated disks of copper. Into this is ponred mercury to the depth of one foot, and into the bottom is introduced 1 ½ inch iron tuhe, which has a vertical height, ontside, of 15 feet. The stream containing the gold, sand and rock debris is let in to the top of this tube, and the pressnre of the column is sufficient to force the water up throngh the mercury, in a fine spray caused by the perforated disks. It is claimed that all the fine gold is amalgamated during the passage From the top of this recepticle the stream passes into and downward through a second chamber, filled with small balls of copper amalgam. It is claimed that the tailings which finally escape contain neither amalgam, floured mercnry, nor free gold.

CALIFORNIA WHEAT FOR COLORADO.—Messrs. Bryant & Cook, of this city, have commission orders to purchase wheat for parties in Denver, Colorado, and will soon send forward a cargo. The superiority of California wheat will increase its market places as fast as its qualities become thoroughly known.

THE city of Cincinnati, Ohio, owns over $15,000,000 worth of real estate, together with the improvements thereon, and has a debt of less $5,000,000. In a financial light this may be said to he a very healthy condition.

OUR LONDON AGENT.—Frederick Brash, 21 South Grove East, Mildmay Park, N. London, England, will act as agent for the PRESS and receive subscriptions and advertisements at our lowest rates.

And in accordance with law, and an order of the Board of Trustees, made on the 27th day of June, 1872, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, Room 5, No. 302 Montgomery street, San Francisco, Cal., on Thursday, the 22d day of August, 1872, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

WM. H. WATSON, Secretary.

Office—Room 5, No. 302 Montgomery street, San Francisco. nu3-3t

Piermont Milling and Mining Company—Location of works, Piermont Mining District, White Pine County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 10th day of July, A. D., 1872, an assessment of Sixty Cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the office of said Company, Room No. 2, 418 California street, San Francisco. Any stock upon which said assessment shall remain unpaid on Monday, the 12th day of August, A. D., 1872, shall be deemed delinquent, and will be duly advertised for sale, at public auction, and unless payment shall be made before, will be sold on Tuesday, the 10th day of September, A. D., 1872, at the office of the Company, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

jul20-4t J. W. CLARK, Secretary.

Spring Mountain Tunnel Company—Location of works, Lincoln County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 9th day of July, 1872, an assessment of thirty cents (30) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary. Any stock upon which said assessment shall remain unpaid on the 16th day of August, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 7th day of September, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.

Office, Room 37, third floor, New Merchants' Exchange, California street, San Francisco, California. july 13

William Penn Consolidated Gold and Silver Mining Company—Location of works, Devil's Gate District, Storey County, State of Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 2) levied on the third day of July, 1872, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Thomas Finn	Unissued.	630	$63 00
D Murphy	Unissued.	40	4 00
H Toomy	Unissued.	1700	170 00
Thos McNamarra	Unissued.	600	60 00
H F Cutter	Unissued.	1060	106 00
B M Hertshorno	Unissued.	600	60 00
John Hewston, Jr.	Unissued.	250	25 00
Chas Minturn	Unissued.	500	50 00

And in accordance with law, and an order of the Board of Trustees, made on the third day of July, 1872, so many shares of each parcel of said stock as may be necessary will be sold at public auction, at the office of the Company, No. 6 Montgomery street, San Francisco, California, on Monday, the 2d day of September, at the hour of 12 M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expense of sale.

JNO. F. POPE, Secretary.

Office, No. 6 Montgomery street, San Francisco, California. sug10-4t.

Winnemucca Chief Silver Mining Company—Location of Works, Humboldt County, State of Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 19th day of June, 1872, the several amounts set opposite the names of the respective shareholders, as follows:

22v24-3m

Machinerv.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco.

FOR SALE.
A 10-STAMP QUARTZ MILL,

Known as the Montszuma Mill, in Montszuma District, Nya County, Nevada.

All in running order, with Pans, Belting, Furnaces, etc. In a good locality for custom work. The mill can remain or be removed.

THIS PROPERTY CAN BE BOUGHT AT

A LOW FIGURE.

Inquire of **R. T. VAN NORDEN,**

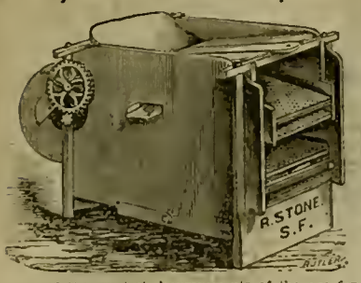
THE PATENT
Novelty Mill and Grain Separator



one of the greatest improvements of the age for cleaning and separating Grain, while it combines all the essential qualities of a first-class Fanning Mill. It also far excels anything that has been invented for the separation of Grain. It has been thoroughly tested on all the different kinds of mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.

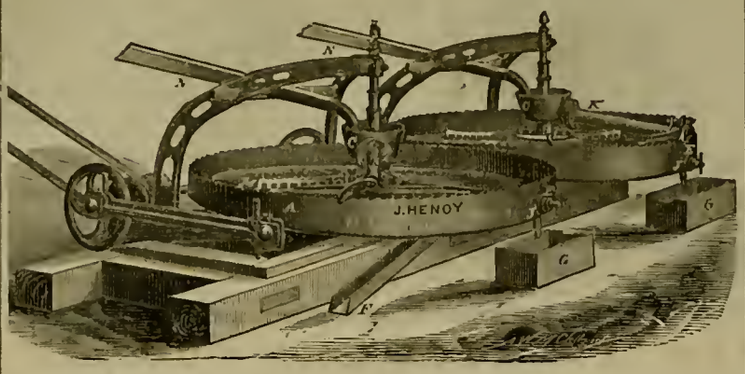
HENDY'S
LATEST IMPROVED PATENT SELF-DISCHARGING SULPHURETS CONCENTRATOR.



Can be seen at the Manufactory, 32 Fremont Street, San Francisco.

Those in want of Concentrators would do well to visit some of the quartz mills that have Hendy's Patent Concentrators in use, and satisfy themselves before purchasing other Concentrators of pretended merit. THEY ARE WARRANTED TO WORK SATISFACTORILY.

The principle upon which HENDY'S PATENT CONCENTRATOR is constructed is the only true and mechanical one for the purpose of concentration.

Centrifugal Force and Gravitation,

Combined as they are in this Machine, CANNOT FAIL TO ACCOMPLISH the object sought.

Many certificates from proprietors of mills, who have this Concentrator in use, can be had if required, giving the most flattering accounts of its efficiency.

A most substantial evidence of its worth is the fact that its proprietor is receiving repeated orders from those who are using them, and who have tested their merits.

The proprietor has still further improved the machine, making it stronger and still more durable. He flatters himself that the added advantages leave nothing further to be desired as the perfection of the machine.

References:

Reference is made to the following mills, some of which have had HENDY'S CONCENTRATORS in use for over four years.

EMPIRE MILL. (8 Concentrators)	Grass Valley, Nevada County.
NORTH STAR M. & M. CO. (8 Concentrators)	Grass Valley, Nevada County.
VULTURE CO. (8 Concentrators)	Prescott, Arizona.
NOYE'S & CO'S MILL. (2 Concentrators)	Prescott, Arizona.
LUCY MINING CO. (3 Concentrators)	Owyhee District, Idaho.
EL TASTE CO. (3 Concentrators)	Sonora, Mexico.
ST. LAWRENCE MILL	Georgetown, El Dorado Co.
ST. PATRICK MILL	Newcastle, Placer Co.
JULIAN MILL	Newcastle, Placer Co.
VIRTUE MILL	Oregon.
KEYSTONE MILL	Amador Co.

CAUTION—All of HENDY'S PATENT CONCENTRATORS are marked thus: "J. HENDY, Patented April 17th, 1866, and May 19th, 1868."

A Worthy Invention—The Importance of Reliable Patent Agents.

MESSRS. DEWEY & CO., PATENT AGENTS, No. 338 MONTGOMERY ST., S. F.—*Gents*:—To remove a reproachful custom detrimental to the present and permanent interests of California. To preserve and perpetuate the wealth of the soil, the true source of a nation's prosperity. To make farming remunerative, reliable and attractive. To abolish the wanton, but heretofore necessary practice of annually destroying by fire, the vast fleeces of straw produced throughout this great State. To improve and increase in a four fold degree, the quality and quantity of feed at a time when so greatly needed, by the millions of sheep and thousands of starving cattle that are annually driven from the many pastures of the State to subsist in our valleys during the long dry period between the months of July and January.

You were by me recently furnished with a complete working model of a machine that will cut, chop, roll and spread evenly, or in rows, all the straw over the surface of the land, thereby affording immense quantities of improved feed of a choice kind for cattle and sheep, the refuse left by them not to be burned, but to be turned under by the plow to manure the ground on which it grew.

Understanding my right to said machine has just been secured through your efficient instrumentality, I regret my inability to use language sufficiently forcible or expressive of my high appreciation of your firm in the capacity of Patent Agents.

Your integrity, business ability and discreet dispatch are remarkable and praiseworthy.

The public generally and justly suppose that the Patent Agent holds a position peculiarly sacred and responsible, yet it is well known that unreliable and unprincipled men frequently find their way into that honorable calling, not to protect their patrons' interests, but for purposes of prey, hence the magnitude of distrust indulged in by many inventors when transacting business through agents of whom they have but a limited and meagre knowledge.

I have known persons to retain in model form their inventions for years before being reconciled to allow an agent to look thereon, thus debarring themselves and the world from the benefits of their really valuable invention.

Suggestions to Patentees.

After a valuable discovery is made, the first question put is, where shall I find an agent who is known to be able, honest and reliable.

To remove distrust from the minds of this class of persons as a guide to the simple and unwary, I would suggest that it is a duty encumbent upon all patentees to have secured to every patented article or machine of worth, the name of the agent through whom the patent was secured.

By this means I apprehend a discerning public would see and know by a better than newspaper evidence, through whose instrumentality valuable patents have been obtained.

Inventors throughout the length and breadth of the whole land would be conducted to proper persons who would foster, not fleece them of their rights, besides affording publicity to a truthful and substantial character to worthy and deserving agents, by the right means—the machines themselves. By the right parties—the Patentees.

Irresponsible and dishonest men would be shorn of patronage and driven into deserved seclusion. Able and worthy agents would be elevated to an eminence, honorable and enviable by the potent pressure of public esteem.

Inventors stimulated to increased activity and energy, improvements in all branches of legitimate pursuits would make great and rapid strides, labor lightened, humanity dignified. Upon the plan suggested I shall always act, and cause, as far as possible, to be carried out, confident as I am that I thereby discharge a duty, a duty I owe to myself, to my agent and to a solicitous and inventive public.

Many of my machines are now useful and valuable, adapted as they are, not only to this State, but every State throughout this great and influential country. The Canadas on the north and vast possessions of other governments on the Continent, Australia and the Colonies as well, and each one as it goes shall contribute to give to DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, SAN FRANCISCO, CALIFORNIA—that honorable and enduring public prominence so justly and well deserved. With undiminished confidence, W. A. DAWSON.

To Engineers and Millmen.

NATHAN & DREYFUS'
PATENT
Self-Acting Lubricators for Cylinders.

Their advantages over other lubricators are so striking, that it is only a question of time for them to come into general use—their accuracy in keeping the valves and pistons thoroughly and constantly lubricated being unequalled. A close examination of this sectional view of Lubricating Cup will give an idea of its working.

The principle of working is based on an intermittent condensation of steam in the UPPER PART of the cup containing the lubricant. At every couple of strokes, the steam condensing, produces a drop of water, which being heavier than the oil, sinks by its own gravity, and raises a corresponding drop of oil over into a tube, which arises in the center of the cup and conveys said oil directly to the chest and cylinder, this tube being the only connection from the Lubricator to the internal part of the engine. The water produced by the condensation is drawn off once a day by a side-cock, and the cup filled again with the lubricant. Another advantage is, that the condensing process refines the oil, as the water settling down thro' lubricant carries down salts and acids which may be contained therein. In this way corrosion of the steam chest and cylinder is prevented, the power of the engine improved, and an amount of packing saved. These Lubricators have been adopted on THOUSANDS of stationary and marine engines, steam pumps, steam fire engines, and locomotives by over EIGHTY RAILROADS in the United States.

SAN FRANCISCO, SATURDAY, AUGUST 17, 1872.

VOLUME XXV. Number 7.

The Diamond.—No. 2.

It will doubtless interest many of our readers to learn how the elegant brilliant, which always sparkles and flashes so brightly iu its finished state, occurs in Natnre; how it appears when taken from its matrix, how it is obtained, and how distinguished from other crystale similar in appearance.

The Geological Position of the Diamond.

The diamond is most commouly found among the debris of a peculiar laminated schistose rock, known to geologists as *itacolumite*, helonging to the talcose series, and said to be metamorphic. It owes its lamination to the presence of a considerable amount of talc or mica. This rock is fonnd in Brazil, in the Urals and in Georgia and North Carolina—all diamond localities.

When this *itacolumite* has heen hroken down by natural causes, and mixed with earth, sand and hroken, loose, angnlar quartz fragments, and not far removed from its original place, it is called *gurgulho*. When it is mixed with rolled quartz pehbles, ronnded gravel much ahraded by water, and with the appearance of having traveled far, and the whole united into a kind of cement, by the presenee of a ferruginous clay it is called *cascalho*. It is in these two secondary conditione of the itacolumite in which the diamond is songht for as an article of commerce. It is never eought for in the nndisturhed itacolumite; hnt only after that rock has heen thus broken down and concentrated by the rivers—the great eluices of nature—into gurgulho or cascalho. If gold was diffused through the country rock, like the diamond, even that wonld not he worked in place. Such work is possihle only hecause that motal is found concentrated hy nature in its original matrix, the veine of quartz, which intereeam the country rocks. That the itacolumite is the true matrix of the diamond has been made quite certain of late years from the fact of several diamonds having bcen found in that rock as it existed in place.

We have said that the diamond is most commonly found among the debrie of itacolumite; hnt it ie also occasionally found in Brazil, among the debris of a peculiar kind of eandstone, and gcologists who have recently visited the diamond fielda of Africa report that it occura there almost altogether in sandstone similar to that in which it is eometimes found in Brazil.

By what we can learn from an engineer, supposed to be in the confidence of the Roberts-Harpeuding Co., and from conversation with persone who have traveled extensively in the localitiee where it is supposed the ground of that company is located, wc have good reason for believing that the eame kind of sandstone underlies a large portion of that region, and that the drift of the localitiea where the diamonds are fonnd has been removed juet ahout far enough to constitute the *gurgulho*, which, according to Dana, furnishes thc best class of diamonds.

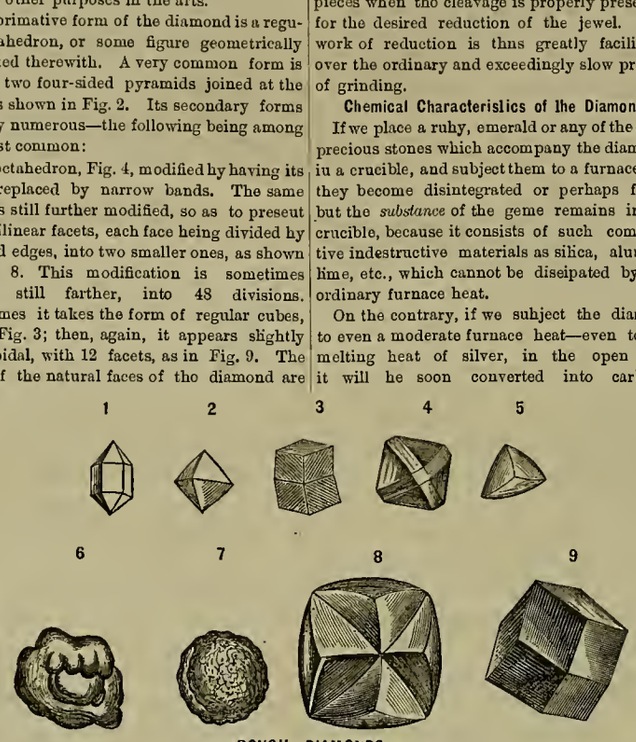
The Diamond in Ihe Rough.

Passing over, for the preeent, the manner in which the diamond is waahed out from the gravel and separated from the foreign matter in which it is often eucased, we pass directly to the consideration of the form and character which it presents hefore art has lent its aid to shape and further beautify it.

The diamond usually occurs crystallized, and with rare exceptions in small epherical grains, which often present very dietinct crystalline faces, transparent, translucent or opaque; eometimes slightly tinted with blue, green, clove brown or rose red. It is also fonnd massive or simply crystalliue, without lines of crystillization as in the black diamond or boort, as it is sometimes called, and which is used for drilling and other purposes in the arts.

The primative form of the diamond is a regular octahedron, or some figure geometrically connected therewith. A very common form is that of two four-sided pyramids joined at the base, as shown in Fig. 2. Its secondary forms are very numerous—the following being among the most common:

The octahedron, Fig. 4, modified hy having its edges replaced by narrow bands. The same figure is still further modified, so as to preseut 24 curvilinear facets, each face heing divided hy elevated edges, into two smaller ones, as shown in Fig. 8. This modification is sometimes carried still farther, into 48 divisions. Sometimes it takes the form of regular cubes, as in Fig. 3; then, again, it appears slightly rhomhoidal, with 12 facets, as in Fig. 9. The lines of the natural faces of tho diamond are



ROUGH DIAMONDS.

usually slightly curved, as in Fig. 5, and the faces themselvee slightly raised, ae imperfectly shown in the same figure. These curvatures are an infallihle test for a diamond.

Though crystallized, and of the purest water, diamonds sometime entirely loose their regular form and asaume a massive or irregular, nodular shape, ae in Fig. 6.

The Boort or Black Diamond.

Fig. 7 represents a eomewhat peculiar, though very common, rounded, concretional form, denominated boort or boart, which is classed among the black diamonds. This curious substance has no cleavage, like the true diamond, and is supposed to he a sort of connecting link hetween carbon in its ordinary forms, and as a true diamond; hence it ia sometimes called "diamond-carbon." Its hardness is equal to that of the true gem, while its epecific gravity ie much less. Under the microscope it appears distinctly crystalline, and apparently an aggregation of granulea or lamellas of diamond, analagous to a grit of quartz sand. It sometimes contains cavities, empty or filled with foreign substances. It is found of various sizes from that of a pea or less to a large sized marble. One is reported to have been found which weighed a pound. It waa formerly but little valued; latterly, however, it has very much advanced in price. Minora sometimee eoak it iu vinegar to add to its weight, aa some unscrupulous persons sometimea do retorted gold in water. It ia employed chiefly as duet for diamond cutting. It is also used in the diamond drill. When burned it leaves a emall residue of ash, the product of the foreign minerals which become entangled in its cavitiee, prohahly during its aggregation.

All diamonds having regular forms are of a laminated structure, as shown iu Fig. 3, and are readily divided along the planee of lamination. This peculiarity is often taken advantage of by diamond cuttere chipping off small pieces when tho cleavage is properly presented for the desired reduction of the jewel. The work of reduction is thns greatly facilitated over the ordinary and exceedingly slow process of grinding.

Chemical Characterislics of Ihe Diamond.

If we place a ruhy, emerald or any of the other precious stones which accompany the diamond, iu a crucible, and subject them to a furnace heat they become disintegrated or perhaps fused; but the *substance* of the geme remains in the crucible, because it consists of such comparative indestructive materials as silica, alumina, lime, etc., which cannot be diseipated by any ordinary furnace heat.

On the contrary, if we subject the diamond to even a moderate furnace heat—even to the melting heat of silver, in the open air—it will he soon converted into carbouic acid gae and pass off, like any other gae, into the atmosphere. It turns hlack and burns just like a piece of anthracite coal—to which substance it is nearest allied; only it does not leave any ash, hecanse it ia pure carbon, while anthracite is carbon with a little earthy matter mixed with it.

The diamoud though the hardeat of all substances, ia neither a etone nor any other mineral—it is simply cryatallized carhon, which ie an organic suhstauce and not mineral.

Manner of Searching for Diamonds.

Diamond placere, where water is convenient and plentiful, are worked much as gold-placers are, by washing or eluicing off the lighter earthy mattere, when the residual heavy portions are placed upon a table, where a convenient search may be made for any loose diamonds which may be found. That done, the lumps which have not been diseolved are carefully hroken up and examined. Sometimes the diamond is found encased in a hard concretional substance to which the diamond is a sort of kernel. Of course much care must be exercised in breaking up euch lumps or concretious to find the precious jewele which they encase.

The lahor of washing is more or lees tedioua, according as the gravel is more or less yielding to the softening or dissolving action of the water. In some placea the gravel is placed in holea or hollows, and eoaked for some days to render it more easy for washiug.

In most of the diamond fields of the world water for washing is very ecarce, and various devicee are called into requisition to meet that important want, a condition of things which will he fully realized hy all gold miners who have worked for the precions metal in extremely dry districts.

The Arizona Diamond Fields.

We nnderstand from those who are familiar with that portion of Arizona in which diamonds have recently been discovered, that the country thero is quite well watered and abouuds in excellent timber, which may be converted into convenient forms of lumber, in the immediate vicinity of the placers. The country also abounds in grass during the summer months; game is also abundant. The winter climate there corresponds very nearly to that in the foothills about Nevada and Grass Valley in this State. The snow frequently falls a foot deep or more in the valleys and table lands on which the diamonds are found, but soon disappears; while upon the adjacent mountains it lays continuously for from three to five monthe.

How lo Dislinguish Diamonds from other Crystals.

The first thing to be looked after when a suspected stone is found, is to see whether it will cut glass or quartz with its sharp edge. A diamond will do so readily. When the specimens are too small to be held between the thumh and finger for trial, they may he pressed into the end of a stick of hard wood. This test will determine whether the specimen is quartz or not; but will not distiuguish it from topaz, sapphire, zircon, etc., as these stones will also cut glass. It is always safe to save everything that will cut glass or quartz, and rely upon a professional expert to decide upon ite name and valne.

The most certain test for the diamond is its curved edges and faces already referred to, which will always be found on at least one or more of its edges and faces, if uot upon all. A diamond may also be readily distinguished from a quartz crystal by the form of the latter, which is always six sided, while the diamond will be either, four, eight, twelve, etc., as already described. The annexed figures 1 and 2—No. 1 being a crystal of quartz and No. 2 being a diamond—shows the striking and unmistakeable difference between a quartz crystal aud a diamond, when both are perfect and unmodified in form.

An Observatory in the Sierras.

The famous telescope maker, Alvin Clarke of Cambridgeport, Mass., is now engaged in constructing a 27-inch refracting telescope for the U. S. Government, at a cost of about $50,000. It is designed that this instrument ahall he aet up at eome point of high elevation, either on the Rocky Mountains or the Sierra Nevada, and Prof. Young, the well kuown astronomer of Dartmouth College, and Prof. Davidson of the Pacific Coast Survey, have heen employed to select the proper site. After an examination of hoth regions, it ia understood that a point near where the Central Pacific Railroad crosses the eummit of the Sierraa, the elevation of which is ahout 10,000 feet ahove the sea level, will prohably he selected as the site for the new observatory.

The clearnese of the California atmosphere, and the freedom from obstructing clouds at that elevation will render the point designated, moet admirahly suited for astronomical purposes. It is eaid that with such a telescope, and the high magnifying power of which it will admit the use, there is not over one or two days or nights per year on the low Atlantic coast where it conld be used with its highest magnifyiug powera, while on the Sierra, with our freedom from cloude, many more favorable opportunitiea must exist for snch an important use of the extensive power of the instrumont in making observations, and we look forward for marvelloua revelationa in physical astronomy, if the propoeed site ia finally decided on. The attention of the astronomical world has long recognized the importance of an observatory on this coast, and we trust that no misdirected zeal or local jealousy will interfere to prevent the early anticipated conenmmation of such a work.

CORRESPONDENCE.

Notes of Travel in White Pine Co., Nev.

[Continued.]

[By our Traveling Correspondent.]

Schellburn, White Pine, Co.,

Is located a little north of east of Hamilton the county seat, and distant 75 miles; or 90 miles via, Robinson District, and 100 miles nearly south of Humboldt Welle Station, on the C. P. R. R., at an elevation of a little over 6,000 feet above the sea level. It contains about 400 inhabitants and the district contains about 900. It is beautifully located at the west end of Overland Cañon, with plenty of water running on either side of the town and wood in abundance on the mountain sides close by. The town contains two fire-proof mercantile buildings built of stone, the principal one (containing the Post-Office) is owned by W. H. Duren, Esq., and one of the finest interior hotels is carried on here by P. P. Molinelli, containing all the modern improvements for the traveler's comforts.

How to Get There.

Take C. P. R. R. cars at San Francisco, and travel as far East as "Well's" Station, Nev., (known as Humholdt Wells), distant 661 miles; at this point the accommodating stage-men, Messrs. Woodruff & Ennor run a daily line of 6 horse stages to Schellburn, distant 100 miles south of "Wells" Station; fare $20. Should the traveler wish to visit Hamilton and Pioche, from Schellburn there are two stage lines, one owned by a Mr. Grant, and the other by E. J. Travis, Esq.; fare by the former $10, and by Travis' line $5; from Schellburn to Hamilton, or vice-versa. We traveled by Travis' line carrying the U. S. Mails and W. F. & Co's. Express, and faster staging we have never seen—since the early days of travel to Virginia City, making 90 miles in 11 hours and 40 minutes, including stoppages for dinner, and changing horses 5 times.

In making mention of the mines of Schell Creek District, going south, we will speak first of

Queen Springs Hill,

Around which is a group of mines belonging to an English company, and superintended by Prof. Clayton. This hill is located about fourteen miles south of Schellburn.

Passing this point we next arrive at the Sweepstakes mine owned by T. R. Posey and others, together with the Excelsior, Labross, Boprey and Nutmeg. Rock has been worked from all these mines, with very satisfactory results, and all are being speedily developed. On the Labross a tunnel is being run, which when completed will be 600 feet in length; already in 160 feet. This tunnel is being run to test several important ledges, and will tap the same at a depth of about 300 feet.

The Nutmeg, one of this group, developed some few feet from the croppings, exposes some of as rich rock as there is in the district; as to extent it seems to be the largest.

Tehama Con. S. M. Co.

Capital $3,000,000 in 30,000 shares. This corporation own by purchase some seven ledges, bought of the original locators, Samuel Jameson and E. G. Demill, for which they paid the sum of $28,500; present owners, Hon. John Boggs, Geo. Treat, J. N. Dickinson, Arch. McDonald, Edgar Mills, W. H. Duren and Jas. S. Cameron; Arch. McDonald, Supt.

This company's property is located on Central Hill, four miles south from Schellburn; their developments consist of a tunnel running in to tap the ledge at a depth of 500 feet from the cropinge; this tunnel is now in 150 feet, working night and day. On the surface this company are sinking on the ledge—if you may call it one—but it is more like taking down the face of the mountain, and taking out rock that will pay from $100 to $10,000 per ton, and everything will average $100 per ton, that meets the eye; they are working twenty men; a 30-stamp mill will be immediately put upon this mine, and they have splendid water power and wood.

Schell Creek District—Springville,

Situated one mile nearly north of Centerville, known as Maguire and Whitworth's town site; this site commands one of the best water privileges in this section of Eastern Nevada. Two buildings have been erected at this point, one a hotel. The Home Ticket mine, described elsewhere, is within a quarter of a mile of this point. Timber is abundant, and fine grazing; animals live out here well the year round.

Centerville.

This little village just springing into existence, is located a little east of south of Schellburn, on the east side of the Schell Creek Range, 8 miles from Schellburn, or midway between the latter and Ruby Hill; this place contains at present about 40 inhabitants.

The town site of Centerville, together with the water privilege, and the following named mines or locations are owned by R. J. F. McWilliams and Mr. Masterson, all of which are fine locations, and more or less developed. The Snow Storm down 10 feet, assays from $70 to $1,250 per ton, extends 1,000 feet on the ledge. The Morning Star claim has a ledge of 800 ft.; Great Eastern 1,000 ft.; Anna mine 1,000 ft.; First South Ext., Elephant 1,000; Monitor mine 1,000 ft.; First Northern Ext., Simon 1,000 ft.; Mohawk mine 1,000 ft.; Nantucket mine 600 ft.; Hidden Treasure 600 ft.; Mahogany mine 800 ft.; Argenta mine 1,000 ft.

Pennsylvania M. and M. Co.

This company is an incorporation of $1,000,000 capital stock, in 10,000 shares. J. M. Livingston, Pres.; Dan Buck, Sec.; office S. F.; Joseph Woodworth, Supt. The mine of this company is located about one and one-half miles north of Centerville, working ten men; like the majority of mines in the district the ore is obtained from the surface and running in the ore of this mine is silver, slightly base, and will average about $100 per ton; selected rock will run into the thousands.

This company have in course of construction a five-stamp mill, with two pans, and expected to be completed and running by August 10th. It will be run by steam engine of about twenty-four-horse power, and will have a capacity to reduce ten tons per day. It is the first mill in the district as yet.

The Town Site of Centerville,

Consisting of 160 acres, together with the water privilege, which is fine, is claimed by R. J. F. McWilliams & Co.

Silver Canon District—Grace Mining Company.

This is an incorporation of $6,000,000 capital stock, in 60,000 shares. James Gamble, Pres.; Wm. H. Knight, Sec.; and Caleb Whiting, Supt. This company own a group of six ledges or sites known as the Grace, National, Whiting, Marian No. 1, Nellie and Albert, and Dictator. Assays from this group run from $31.42 to $7,093.76 per ton. At present the company are running a cut to cross the Grace ledge to test its width, which is from twelve to fifteen feet. The prospects are so flattering that a mill will in a short time be erected. A splendid water privilege is owned by them in connection with the Silver Cañon Company; and wood is plentiful.

Ruby Hill

Is a village of about 100 inhabitants, situated nearly south of Schellburn, and distant by trail thirteen miles, by stage or wagon-road twenty miles. It contains no hotel, but has two restaurants, and very accommodating miners, who are willing and ever ready to share their rooms with the traveler.

Its Mines.

First, running south is the Northern Light, owned by Taylor, Leach & Co. Second—Bay State, owned by Bird & Co. Third—Cow and Calf, owned by Whitworth and Adams. This was the first location on Ruby Hill, having been discovered on the 16th of July, 1871. Fourth—the Silver Wreath S. M. Co. which consists of ten locations or sites. This property was disposed of by Bird and Fitzhugh, to Col. W. O. Sydney of London; it is prospected in twenty feet by forty feet in width, showing a continuous body of the richest ore in this district.

This company have about 125 tons of ore on the dump that will go considerably over $100 per ton, without assorting. Extensive preparations are in progress to work this mine on a mammoth scale; a mill will be put up immediately.

Next adjoining is the Birch S. M. Co., owned by Bird, Fitzhugh, Taylor & Co. This company have consolidated with a 5-stamp mill (nearly completed) at Rubyville, one and one-half miles west from this place; they have about 20 tons of ore on the dump; but 1,000 tons in eight very rich; will average over $100 per ton, for all in eight; working 4 men; the rock is so easily obtained, that this number will keep the mill running.

Sixth, is the Tambien M. Co. This is an incorporation of $3,000,000; capital stock, in 30,000 shares. J. H. Williams Pres., and David Wilder, Sec; Frank Almon, Supt. A shaft is sunk on this mine about 20 feet deep on the ledge, exposing splendid ore; working 4 men. This is a different ledge from any of the above, and located one-half mile east; like all the other locations in this vicinity, this lode runs north and south, and dips to the east at an angle of about 70°.

Seventh is the Monitor S. M. Co., a San Francisco incorporation. Col. W. T. Robinson is Supt.; now working 2 men—no more to be had—they have a shaft down on the lode 30 feet; the ledge is about 30 feet wide and prospects very rich; they have about 75 tons of $50 ore on the dump. This claim is located one-fourth of a mile below the Tambien, and a little nearer the village of Ruby Hill.

Eighth, Wide West Co., owned by Monehan, Bowie, Maguire, Coburn and Brophy. This is one of the finest locations on this hill, for over 200 feet running north and south, the croppings reveal a ledge from 8 to 30 feet thick, and any point prospects as high as $100 per ton and from that up to $500 per ton. About 45 tons of pay ore is now on the dumps, that is claimed to pay $250 per ton, and it appears to have that value.

Columbus Mine,

Owned by John Wegner, consisting of the Columbus and New York ledges; a tunnel is run into this mine ninety-five feet; at a point ten feet further, they expect to strike the main body of ore, visible on the croppings, in running this tunnel. When in 80 feet, they struck a body (unexpectedly) of decomposed quartz 2 feet thick adjoining which was a body of 2 feet solid ore; this body prospects from $30 to $160 per ton; an incline is sunk from the top revealing a very fine body of ore rich and extensive; working 2 men.

Passing north from the Schellburn are some splendid locations, among the most prominent of which are the

McMahon G. and S. M. Co.,

An incorporation of $3,000,000 capital stock, in 30,000 shares. O. F. Giffin, Pres.; S. R. Spinney, Sec.; and A. P. Cox, Agent; J. D. Holland, Mining Foreman. This claim was located by J. McMahon, Henry Gilbert and J. D. Holland, but was sold and since incorporated by J. H. H. Williams & Co. of S. F., for $30,000. This company own 1,800 feet on this location, which is situated three and one-half miles north of Schellburn. They are now drifting on the ledge, facing into the mountain, on a vein at least twenty-five feet thick.

This rock assays from a few dollars to away up into the thousands, per ton. Several tons have been worked from this mine, in different lots, that averaged $175 per ton, and the whole facing of twenty-five feet, extending some forty feet in, will pay at least that average. This company anticipate running a tunnel to this mine, which will be, when completed, 400 feet in length, and tap the ledge at a depth of 125 feet from the surface; they now employ twelve men. South of the McMahon is the

Woodburn Mine,

Owned by a company in New York; has a 7-foot ledge, and working 10 men; have out 200 tons ore on the dump. W. F. Dyer, the Superintendent, has shipped a lot of the ore to Newark, New Jersey, to Babbuck & Sons, which will work $800 per ton. This mine is situated two and one-half miles north of Schellburn, near the Mc Mahon. From Robinson District, Piermont and Pioche in my next. L. P. MC.

Mining Correspondence.

Star District, Utah.

At present business is rather dull in this district, but the people expect to have a lively camp pretty soon. A correspondent of ours writes that the mineral wealth of Beaver county, Star and surrounding districts, is immense, but that at present the country is suffering from want of money, though they expect that in a year from now that section of mining country will be second to none in the Territory. Nature has provided everything necessary to work the mines successfully with but little expense; all they want is cheap transportation and some assistance from capitalists, which latter item is always an important one in a new district. Timber and water are to be found in abundance in the county and near the various mining districts. In close proximity to the silver lodes are splendid copper and base metal mines which will attract the attention of capitalists when the country is better known. A mill and roasting furnace are wanted there, as well as in many other places, and our correspondent says that a fortune is waiting for the man who has enterprise and capital enough to bring one.

Schell Creek Mines.

A correspondent writes us as follows from Humboldt Welle, Nevada:

Thinking that a few items from an old Grass Valley acquaintance visiting these parts might prove acceptable, I give you such as have come under my own observation. Three weeks since I left San Francisco with a view of learning for myself of the recent discoveries in and about Schell Creek, as well as other districts in the immediate vicinity, and I must say that for once I think the prospective richness of the Schell Creek mines has not been overdrawn.

Commencing with the McMahon and Woodburn mines on the north, each day's work but confirms the good opinions formed on their purchases. Continuing south on Queen Spring mountain, and still farther on to Centreville the developments are proving up the permanency of the mines.

Joe Woodworth will have his mill (5 stamps) running by the first of August on ores from the Home Ticket mine recently purchased by his company. At Ruby Hill I saw evidence from the rich outcropping leede, which will far surpass anything in the district. I would refer to one lode in particular—the Silver Wreath—purchased some two months since by an English company for $30,000, which I think could not be bought to-day for $100,000. The face of the lode or rather width going into the hill is seventeen feet—all the ore averaging about $150 per ton. They have some 200 tons on the dumps already,—the result of four men's work for six weeks. It is absolutely impossible to calculate on the value of this mine, should the ore body go down. Much of the ore is of a very high grade, say from $1,000 to $2,000 per ton, and which is being sacked for the purpose of shipment. There are many other leads adjoining, and continuing on in the silver belt which give every evidence, from surface indications, of being equally as rich when developed.

Thus far little has been done outside of the Silver Wreath company towards opening up new claims, prospectors preferring to sell rather than develop. Schellburn continues to improve, both in building and in daily increase of population from the surrounding districts. Yesterday I learned from a gentleman from Toano that two mines—the Wilson and Silver Zone—located in the Silver Zone district, eighteen miles south of Toano, has been purchased by Capt. Cheever for San Francisco parties; consideration about $15,000.

On Saturday last, D. H. Barker (civil engineer) left this point (Wells) with his party to make the preliminary survey of a narrow gauge railroad south as far as Robinson district, going via. Spruce Mountain and Schell Creek.

THE COAL FIELDS OF ENGLAND.—In a recent lecture by a geologist engaged on the Royal Coal Commission, the opinion was expressed that the Coal fields of England had originally been joined together in one large area, but that by various changes, such as downthrow, the various fields had been separated. The intervening spaces, it was conjectured, covered coal, which, however, was buried so deep that it could not be worked with profit. It was asserted that considerably more coal lay concealed at workable depths than appeared in the fields. The South Staffordshire field, it was asserted, contained 3,201,672,216 tons of coal; the Warwickshire, 458,652,714 tons; and the Leicestershire, 836,799,734 tons, making a total of 4,497,124 664 tons. Underneath the Permian strata of rock of the above fields it is estimated that there are to be found 14,664,000,000 of tons of coal

SCIENTIFIC PROGRESS.

Contortion of Rocks.

The phenomenon of a layer of limestone, slate, coal, or other rock, bent even to a right-angle, without utter fracture, is one which a endden force could not produce, if the mass were solid; and the hypothesis that in such cases that the strata were soft and plastic at the time of contortion, does not explain the circumstances, and is for some kinds of rock *a priori* difficult or impossible to admit. When it is once assumed, however, that the forces lifting and binding rocks, were and are mostly very slow and gradual in their action, the difficulty vanishes; for it is now demonstrable that solid and crystalline rocks can be permanently changed in form by such pressure.

Sir James Hall, by an experiment now familiar to geological students, showed upon a pile of cloth, representing a series of sedimentary rocks, the effect of horizontal, lateral pressure in causing curves and folds; but Mr. L. C. Miall, Curator to the Leeds Philosophical Society, has recently applied a similar apparatus to the actual flexure of thin layers of stone, and has found that they can not only be bent within the limits of elasticity, but permanently "set" without fracture. He says of certain bituminous mountain limestones, "The elasticity of the rock was greater than I had expected, but the set or permanent deflection produced by long-continued pressure of inconsiderable amount, far exceed what I had hoped to find. It may be doubted whether there is any limit to the bending which a careful and patient observer can produce."

It must be remembered that strata thus exposed to lateral pressure, in nature are protected against breaking by the inclosing rocks. To imitate this condition, Mr. Miall embedded thin slabs of limestone in pitch, and succeeded, by application of pressure at the edges in bending such slabs, nine inches long, until they rose two-thirds of an inch in the center. These experiments are confirmed by many well-known instances of natural contortion. Mr. Miall mentions a number of similar instances, and quotes also the experience of elaters, who find that when, by the yielding of timbers the surface of an old roof has become bowed, the (stone) tiles are distorted to such an extent that they will not lie flat on a new roof; and miners, engineers, and architects are familar with such effects produced by long strains upon imperfectly-supported stone.

These facts may help to explain the phenomena of contorted rocks, pebbles, crystals, and fossils, formerly so puzzling to geologists. They have some bearing also upon the question of the movements of ice in glaciers, etc.

Improved Manufacture of Homogeneous Metals.

Mr. G. B. Galloway, of London, has a patent for improvements in the manufacture of iron, which he denominates "iron-steel." He proposes to accomplish the purification of the iron in its manufacture by a specially prepared fuel consisting of creosote and other dead oils made into fuel with a mixture of duff coal breeze, the refuse of sawmills, various waste materials and peat. This fuel will contain no sulphur, and will have the tendency to diminish the sulphur or phosphorus which ores generally contain, and, therefore, the first stage of manufacture will produce a purer product than when coal or coke is used. He also proposes to use zinc, tin and lead in the mixture of metals, as may be required to produce the quality of iron wanted. He proposes to obviate the necessity for puddling by arranging the blast, which is to be of superheated air and steam, in different jet pipes, which are to enter the cupola at various places. The air and steam pressure is to be varied and regulated by valves or stop cocks in the pipes, and the force of the blast will puddle up the iron. He also proposes that air and steam from a branch pipe shall impinge upon the metal, which runs from the furnace by a circuitous route, so thus further purified and made into rolls or balls of the like consistency in heat, and thus is ready for the steam hammer or rolling mill. The patent specifies a mode of making special qualities of homogeneous iron for ship and boiler-plates, which iron would be but little corroded by water, would be strong and tough. A special quality is also made for armor-plates rolled to V form in the horizontal sectional view. This outer form would be so tempered as cutting chisel steel, that it would have the tendency to prevent the penetration of shot by breaking it up, while the mode of filling up the divisional spaces in the plates with wood or other fibrous material would deaden and absorb the concussion and effect of shot.

PHOSPHORUS ABSORBED BY CARBON.—M. M. Eulenberg and Vohl have demonstrated that phosphorus is absorbed by carbon, and to such an extent that, taken in the form of pills, carbon constitutes a complete antidote to the poison, and relieves those who have to manipulate phosphorus from all the disastrous consequences hitherto accruing. It has been found that the results of these pills in match factories are better than those obtained by the use of the essence of terepenthine, as the continued use of the latter produces violent headaches.

Production of Ozone with Electricity.

Experiment has shown that in the production of ozone by electricity the maximum amount of oxygen is ozonized by the silent or glow discharge, and most of the forms of apparatus by which this is affected are so contrived that the oxygen flows slowly through a space traversed by such a discharge. In the apparatus of Von Babo, of Siemens and of Houzeau, the metallic conductors are separated by glass and a stratum of air. By inductive action of the charged metallic surfaces the intervening air becomes charged with electricity oppositely upon its two sides, and simultaneously with the discharge of the metallic terminals. Through the wire of the coil, a discharge takes place through the air, not in the form of sparks, but diffusely, producing a glow of purplish light, visible only in the dark. These apparatus succeed best with electricity of comparatively low tension. In using the Holtz electro-machine, with them the discharge is apt to occur chiefly in the form of sparks, and the shape of the apparatus must be varied to give the best results. When the poles of the machine itself are separated to a sufficient distance, the electricity passes either in the form of a diffuse brush, spanning the whole interval, or with a very minute brush upon the negative pole and a glow upon the positive, the intermediate space not being visibly luminous. This is the so-called dark or silent discharge, exhibiting the phenomena of the electric shadow when suitable objects are interposed. When this occurs, the strong odor shows that a considerable amount of the atmospheric oxygen is converted into ozone. If the discharge takes place in an enclosed space through which air or oxygen can be driven, the ozonizing effect of the electricity is heightened and can be utilized. Prof. A. W. Right (*Am. Jour. Sci.* for July) gets very satisfactory results with an apparatus consisting of a straight glass tube, 20 c. m. long with an internal diameter of 2½ c. m., having the two ends stopped with corks covered on the inner side with a coating of cement, to protect them from the ozone. Through each cork is passed a glass tube, 5 m. m. in caliber and 7 m. m. long, having a branch tube inserted perpendicular at the middle and long enough to permit a rubber tube to be slipped upon it. The outer ends of the tubes are closely stopped with corks, through which passes copper wires carrying suitable terminals at their inner ends and bent into a ring at the others. They are fitted so as to make tight joints, but to allow of motion in order to vary the distance between their inner ends. One of these wires carries a small ball; the other terminates in a disk with rounded edge each perpendicular to the axis of the tube, and so large as to leave an annular space of two or three millimetres breadth around it. The gas is admitted through one of the branch tubes and escapes from the other after having passed through the whole length of the tube.

HISTORICAL LESSONS FROM A BRICK.—Who would suppose that an humble brick could be capable of imparting valuable and important information, even to corroborate the sacred writings? But an Austrian *savant* has discovered, by means of a microscope, in a stone taken from the pyramid of Dashour, many interesting particulars connected with the life of the ancient Egyptians. The brick itself is made of mud of the Nile, chopped straw and sand, thus confirming what the Bible and Herodotus have handed down to us as to the Egyptian method of brick-making. Besides these materials, the microscope has brought other things to light—the *debris* of river shells, or fish, and of insects, seeds of wild and cultivated flowers, corn and barley, the field pea, and the common flax, cultivated probably both for food and textile purposes, and the radish, with many others known to science. There were also manufactured products, such as fragments of tiles and pottery, and even small pieces of string made of flax and sheep's wool.

ODOR OF PLANTS.—Mr. J. Britten, in the *Gardener's Chronicle*, says: "A large proportion of pale and white blossome are fragrant, and it is ascertained that these predominate in northern regions. We may therefore conclude that the relative number of odorous flowers is greater towards the poles than toward the equator. It would seem that the too powerful action of light and heat is opposed to the emanation of the odors of flowers, and we see many specimens which are scarcely fragrant during the day, become so in the evening or during the night. But if the odors emitted by the blossoms are more frequent in the north, the reverse is the case with the essences inclosed in the glands. Plants with fragrant leaves, aromatic fruits and wood penetrated with essential oil are scarcely found except in warm or tropical climates."

OZONE IN THE AIR.—According to a paper in the *Journal* of the Scottish Meteorological Society, observations have shown that when the air had a pleasant sharpness and stimulating influence, the largest amount of ozone was present; when it was close and depressing, little, if any, ozone was detected.

THE OXHYDRIC LIGHT, says *Engineer*, has not proved a success in Paris, and has been discontinued in the public lamps in the Boulevard des Italiens.

MECHANICAL PROGRESS.

Siemens' Steam Jet.

In order to avoid, in the use of the steam jet, the eddies in the combined current of steam and air, and to utilize more completely the initial movement of steam, Siemens employs a thin annular jet of steam in the form of a hollow cylindrical column, discharged from an annular nozzle. The air to be propelled is admitted through an exterior annular orifice surrounding the jet, and also through the center of the hollow jet, and the area of the air passages is gradually contracted on approaching the jet, whereby the velocity of motion of the entering air is so much accelerated, before it is brought in contact with the steam, as to avoid the great difference in the velocities of the two currents, at the point where they come together, which caused the eddies which previously impaired the efficiency of the steam jet. By the annular form the extent of surface contact between the steam and the air is greatly increased and the quantity of air delivered very much augmented in proportion to the quantity of steam employed. The combined jet of steam and air is discharged through an expanding pipe of considerable length, in which its velocity is gradually reduced and its momentum accordingly utilized by being converted into pressure.

The result of a comparative trial made in exhausting pneumatic despatch tubes, with the jet and a good steam engine and exhausting pump has been found to be about an equal expenditure of steam in doing the same work, with much less first cost, smaller space occupied and much greater simplicity in favor of the jet.

Another application of the steam jet is to the lifting of water from a moderate depth, by employing the jet to exhaust the air from a closed vessel, in which the water thus rises under the pressure of the atmosphere, the hight of the lift depending upon the size of the jet and the pressure of steam. This discharge from the steam jet being then admitted into the top of the vessel allows the water to escape through a delivery-valve in the bottom, and aids in its expulsion. By using a pair of these vessels in conjunction, and putting the exhaustion jet in communication with each alternately a continuous delivery of water is obtained.

It is also proposed to apply the steam jet for exhausting the vacuum pans employed in sugar boiling, so as to dispense with the present costly vacuum pumps and steam engine, and the condenser for condensing the vapor from the evaporating pan; also for draining the molasses from the sugar, by exhausting the air from below the perforated bottom of a strainer containing the undrained sugar, superseding the present modes of draining by gravitation or by centrifugal strainers. Numerous applications have been made of the jet as a blower for accelerating the distillation of fuel in gas-producers for heating purposes, the jet being admitted into the space below the fire grate, which is enclosed by doors. This admits of the use of the most inferior coal-dust and increases the rate of production of the gas.—*Engineering.*

Relative Merits of Rubber and Leather for Belts.

Rubber will not last one-fourth as long as leather. When once it begins to give out, it is next to impossible to repair it; while wide hands cannot be used for or cut up into narrow ones as leather ones can be.

Leather belts may be used over and over again, and, when of no further value for belts, can be sold for other purposes.

A rubber hand costing hundreds of dollars, may be spoiled in a few moments by the lacing giving out, and the hand running off into the gearing, or by being caught in any manner so as to damage the edge, or by stoppage of either the driving or driven pulley. A few moments of quick motion or friction will roll off the gum from the canvas in such quantities as to spoil the band, while leather belts may be torn or damaged, yet are easily repaired.

Should a rubber or gum belt begin to tear by being caught in the machinery, if the rent strikes the seam, it is most certain to follow it, even the entire length, if the machinery is not stopped. It would be impossible to tear leather in like manner.

Oil in contact with rubber belting will soften the gum; and rubber, gutta percha, and canvas belts will continue to stretch as long as in use, rendering it necessary to shorten them continually.

During freezing weather, if moisture or water finds its way into the seams, or between the different layers of canvas composing these bands, and becomes frozen, the layers are torn apart, and the band is spoiled; or if a pulley becomes frosty, the parts of bands in contact with it will be torn from the canvas and left on the pulley. Also, gum belts will not answer for cross or half cross belts, for shifting belts, cone pulleys, or for any places where belts are liable to slip, as friction destroys them.

A well made leather band, if properly looked after—the width and pulley surface proportional to the amount of work to be done—will last twelve, fifteen, or twenty years, and yet be of value to work over into narrow belts.—*Scientific American.*

Influence of Cold Upon Iron.

M. Caron has brought before the Paris Academy the results of observations made on the fracture of car axles. In every case he finds the break to result from the bad form of the pieces or faulty nature of the iron. He contests the assertion that bar-iron becomes crystalline and brittle under the influence of winter-cold. In order to test the influence of cold on iron, M. Caron experimented as follows: Several pieces of good bar-iron were exposed for four months in the ice factory of M. Teller, at Auteuil, to temperatures varying from 0° to—18°. Others were allowed to remain throughout the cold of last winter at a temperature of about 20° in the open air. M. Caron then caused the pieces to be broken, both in their cold state, and after the temperature had been raised several degrees above zero. In no case was there any appearance of crystallization. Of course, he had assured himself of the good quality of the iron beforehand. Iron of inferior quality acts differently; its brittleness is perceptibly increased through cold. The experiments of M. Caron seem to prove when a bar of iron breaks, through vibration or shocks, and the fracture presents a crystalline appearance, this crystallized state was that in which the iron was previous to its being used; and it is to be attributed to faulty manufacture, not usage or cold after the pieces was completed. From this it follows that the testing of, *e. g.*, 4 or 5 per cent. of a large number of pieces of wrought-iron does not supply a proper guarantee of the good quality of the remaining pieces, and various treatment of them as regards temperature and other points.

PORTABLE RAILWAY FOR COMMON ROADS.—This invention of Mr. W. Pidding is thus rather indefinitely described by the London *Mining Journal*. The carriage wheels, which are only about 21 inches in diameter, and are fixed to the axle beneath the springs in the ordinary way, run upon what may be popularly described as the insides of the tires of a second pair of wheels of sufficient size to permit the small wheels to rotate between the tires and the naves of the larger ones. This larger tire, which forms the portable railway, is made up of a series of long and short segments, each carefully shod with india-rubber, or which may be constructed of steel, formed into a band chain, one or another portion of which is, of course, always in a position ready to receive the running wheel; the portion which has served the purpose of a tramway as constantly passing around the periphery of the large wheel to regain its position in front of the running wheel. The external appearance of the carriage is not altered.

LIQUID FUEL.—Parties who have charge of the liquid fuel process at St. Louis are pushing it before the public with commendible energy. The process consists of decomposing water, setting free the hydrogen and oxygen which are united with combustible liquids, as petroleum, producing great light and intense heat. A great deal is claimed for this process for illuminating purposes, and it is applied to quite an extent in the manufacture of iron at the Leclede mills. By means of it a puddling furnace is heated in forty minutes and a thousand pound charge of iron melted in fifteen minutes, being twice the amount of work done by ordinary furnaces, and making iron of the best quality.

TAKING THE WARP OUT OF SHEET-IRON.—This may be done by means of hammer, anvil, and principally an able workman who knows how to do it. Those working in metal have often cases in which there is a warp in a sheet of iron, brass, or other metal, and if the workman understands his business, he knows how to hammer it out. Those not expert in this art do not know where to strike, and only make it worse.

TWENTY-INCH SMOOTH-BORE GUN.—Mr. Grasshof, manager of the Perm Works, Russia, has succeeded in turning out a 20-inch smooth-bore gun which has given good satisfaction in the trial experiments. The Russian government has ordered the casting of others.

THE LONDON *Mining World* thinks that "before the lapse of another generation the United States will be the great iron and steel producing country of the world." It observes that "there are causes in operation which will prevent any rapid expansion of the iron industry of this country, while in the other the great resources of that industry are comparatively untouched. Among these causes may be mentioned the limited supply of good ores in Great Britain, the necessity which arises each year of sinking deeper for the fuel to smelt them, and consequently the increased expense of raising it.

THE earliest incorporated mining company of which we have any knowledge, in the United States, was in Connecticut, and was chartered in 1709; its proclaimed purpose was, the working of copper ores in that State.

COMPRESSED-AIR machinery is rapidly finding application in German mines for the use of pumping, drawing stuff, rock-boring, and coal-cutting.

TWENTY-FIVE miles an hour is shown by signal service observation, to be the average velocity of a storm; when it has twice that velocity it becomes a tornado.

NOTES.—†—California. *—Washoe. ‡—White Pine. §—Ely District. ¶—Eureka District. ‖—Idaho. ⊥—Nearly. &—Over.

S. F. Stock and Exchange Board.

Thursday, August 15, 1872.

The stock market has been quiet of late. The sales at the Board for the week ending the 8th inst., amounted to $2,610,000. On the 9th inst. the market was weak and continued so the following day. Monday it wae quite strong again; Tuesday it wae still improving at advanced prices, but Wedneeday prices fell off for all descriptions. This morning the market was again weak and stocks were in light demand.

Shipment from Pioche on the 13th, $10,163. The last weekly clean up at the Eureka mine, was 625 ounces of amalgam from 15 stamps. The Eureka Consolidated mine turned out last week 900 tons of ore; reduced 862 tons; ore on hand 1,431½ tons.

The sum of $33,946 was shipped from the Raymond & Ely on the 12th inst., which, added to previous shipments for month—$103,794—makes a total of $137,740 for twelve days, or at the rate of $11,479.33 per day. The Hale & Norcross mine last week extracted 700 tons of ore, and shipped to mill 1,018 tons. The Savage yielded 1,215 tons, and delivered at the mills 1,152 tons; ore averaged by assay $22.14.

The Sierra Nevada turned out 483 tons; 1,580 tons of ore worked in July, yielded $9,826. The Phenix mine shipped on the 8th inst., 10 tons of hullion valued at $4,000, and on the 11th inst., five tons valued at 2,036. From the Kentuck $3,913.88 was shipped on the 6th inst.; ore shipped in July, 1,271 tons, averaging $23.39 per ton. From the Chollar-Potosi miue last week, 1,726 tons, averaging $37.20 per ton, wae extracted and shipped to mille.

The Minnesota, on the 8th inst., cleaned up $5,584. The Buckeye mine shipped $1,840 ou the 10th inst.

News from the minee later thau given in our mining summary is unimportant. The connection between the 1,100-foot level aud the shaft in the Belcher, has made an improvemeut in the ventilation of the mine. The shaft of tho Belcher, 850 feet deep, is 715 feot from the Crown Point mine, from which the 1,100-foot level was driven south to meet an incline from the hottom of the shaft. This iuchne at 521 feet meete the drift, and, hy so doing, ventilates the Belcher and the Crown Point, also the Kentuck and Yellow Jacket, which are all connected in that drift, which has served for the transportation of the Belcher ore to he hoisted by the Yellow Jacket. The Belcher shaft will he ready to hoist ore ehortly, and the ventilatiou will enable double the ore to he got out. This increased quantity will he hoisted from both shafts, Belcher and Yellow Jacket. The water having heen mastered in the Crown Point, work on the 1,200-foot level has been reeumed and the bulkheads have heen removed from the 1,300-foot level. A letter from the mill master of the Raymond & Ely mine states:

"There are thoueands of tons of ore assayiug $50@100, which ie not taken out for want of mill capacity; but, at au expense of $6,000 or $7,000, hy adding two new pane, etc., and changing the new mill from dry to wet crushing, we can increaee the reduction thirty tons per day with the same amount of lahor, and without any loss of time." Thie has heen authorized to be done, and it ie expected, more ore being reduced, the dividend may he raised. The dividende from mining companiee this month aggregate $557,000. The Belcher dividend amounted to $312,000; the Raymond & Ely $210,000; the Pioche $20,000 and the Mahogany $15,000. The sum of $65,000 was carried over to August account of the Raymond & Ely mine, so the dividend was not increased as anticipated. The Meadow Valley & Crown Point both passed their usual dividends; the latter will pay $5 next month. The Yule Gravel mine which has heen paying dividends heretofore, hae fallen from grace and levied an assessment this month.

Assessments levied this month aro as follows: El Dorado M. Co., Amador Co., 25c.; Empire M. Co., Idaho., 50c.; Mina Rica M. Co., Placer Co., 20c.; Tehama Cous. M. Co., Schell Creek, $2.00; Yule Gravel M. Co., Placer Co., 25c.; Greenhorn M. Co., Cal., $1.50; Ingomar S. M. Co., Ely District, 50c.; Rising Star M. Co., Idaho, $1; Ivanhoe S. M. Co., Ely Dist., 50c.; Adams Hill Cons. M. Co., Eureka Dist., 25c., Union Cons. M. Co., Washoe, 50c.; Original Hidden Treasnre M. Co., White Pine, $1.50: Gould & Curry S. M. Co., Washoe, $15; Arizona & Utah M. Co., Washoe, $1; Page & Panaca S. M. Co., Ely Dist., $5; Tecumseh G. & S. M. Co., Calaveras Co.

Twelve Hunnren Gallons per minute is the estimated capacity of the Goodwin mining pump at the Miners' Foundry in this city, which was illustrated in our issue of August 3d.

Mining Sale.—The Quincy *National* saye that the Eherle Bros., of Secret Diggings, recently disposed of their gravel claims at that place for $35,000.

Mining Summary.

The following ie mostly oond nsed from journals published in the interior, in proximity to the mines mentioned.

California.

AMADOR COUNTY.

Kennedy.—Jackson *Ledger*, Aug. 10: This mine cleaned up last Saturday, after a 15 days' run, $10,600. The rock on the lower level is lookiug very fine, and the vein is also wideniug. The mill is kept runniug day and night.

Copper.—Jackson *Dispatch*, Aug. 10: Morgan commenced work this week ou a copper mine, a few miles below Ione City, which has been lying idle for several years.

BUTTE COUNTY.

Lowell Hill Mines.—Chico *Enterprise*, Aug. 9: Four shafts have been sunk upon the claims, and more satisfactory prospects have heen made in all. From the surface to withiu 4 ft. of the bed rock from 3 to 10 colors of gold can be had to every panful of dirt, and from within 4 ft. of the bed rock, from 12½c. to $1.50 has been repeatedly washed from a single panful of dirt.

CALAVERAS COUNTY.

Upper County.—Calaveras *Chronicle*, Aug. 9: Excellent ore has heen exposed at the Josephine, west of West Point ... Morse & Co. are crnshing a large quantity of rock at Carltou's mill .... A new tunnel has been started at Camp Spirito to tap an abaudoned vein below water level.... The north level of the Bartolo shows a vein 2 ft. wide, with plenty of visihle gold; somo 40 tons of ore on dump.... Levels have beeu started in the Blazing Star at 115 ft.... S. Smith & Co. are crnshing rock from their recent discovery uear Mosquito; the vein is large and the ore is expected to average $15 per ton .... A 5-stamp hattery will be added to the new hoisting works of the Wolverine; 120 tone of high grade ore on the dump of the main ehaft .... The Sanderson has stopped operations.

The battery at the State of Maine has beeu in operation duriug the last week.

New Hoisting Works. — The Wolverine, Railroad Flat, is to he supplied with uew and powerful machiuery.

San Bruno.—The tunnel heing run will be completed in less than 2 months. It will cut the ledge 500 ft. from the enrface.

Hoisting Works.—The Hughee Broe., who own a claim on the Blue lead below the What Cheer in Chili Gulch, are puttiug up hoisting works.

Gwin Mine.—Sinking the south shaft was resumed last Monday. The rock is excellent. The central shaft hae reached 150 ft. and ie going down at the rate of over a ft. a day; 16 stamps are kept running.

Railroad.—San Andreas *Citizen*, Aug. 10: The Sauderson shaft is down 50 ft. The ore on both sides shows heautifully. They have placed steam hoisting works on the claim.

Prussian Hill has a shaft 150 ft. deep. The lode is 8 ft. wide, 3½ of which prospects $50 per ton, and the remainder, including the casing, $15.

Sheep Ranch Mine.—This mine is paying hetter than ever heforo.

Right Bower is working 10 men, and the rock is paying about $70 per ton.

Wolverine.—The shaft down ou this claim ie 220 ft., the width of the lode averagee 3 ft. This Co. have about 100 tons at their dump that will average $100 per ton. They have machinery on the way from S. F. for steam hoisting works, and then will go down 200 ft. deeper.

Petticoat.—Thie mine is thriving, the mill running day and night. The Supt. will make a good clean up next week.

EL DORADO COUNTY.

Hogo's Digginos.—Folsom *Telegraph*, Aug. 10: The quartz mines at Hogg's Diggings, near Pilot Hill, are turning out large quantities of rich rock.

NEVADA COUNTY.

Hope.—Grass Valley *Union*, Aug. 11: Tho clean up yesterday, after a run of 8 days gave 248 ozs. of gold, worth $17 an oz. The expenses for the same time is uot much over $500.

Rising Star.—Nevada *Transcript*, Aug. 8: The Co. who recently purchased the Mammoth, Grizzly and prospect miues, and consolidated them under the name of the Rising Star, have been vigorously prosecuting the work, and everything looks flattering. They have struck a 3 ft. ledge in the face of the old Grizzly tunnel, which it is thought will pay form $20 to $30 per ton. The old tuuuel in the Mammoth, ruu about 200 ft., is heing extended aud they expect to cut the ledge in running abont 90 ft. further. Another old tunuel ruu 449 ft. has been thoroughly repaired and tho new Co. have extended it about 30 feet, aud are still runuing ahead.

PLACER COUNTY.

Encouraging.—Anburu *Stars and Stripes*, Aug. 8: The reports from the quartz mines of this vicinity continue to he highly encouraging. At the St. Patrick and Greene the latest discoveries of ore deposits are quite rich. The pay ledge in the Salsig and in the Auburn, Rock Creek, steadily widen and improve in quality as they descend. The ledge of the Columhia Co. in El Dorado county, ie fully 4 ft. wide, with a pay streak over a foot wide that is reliable for $40 per ton hy milling process. Neff, Taylor and others, on the third extension of the Salsig, at a point on the eastern slope of the big hill have struck a continnation of the Salsig, with fine looking rock and a froquent showing of free gold within a few feet of the surface.

PLUMAS COUNTY.

Big Pay.—Quincy *National*, Aug. 10: Gard & Orr, at La Porte, have recently cleaned up their season's run, and made $20,000 clear of expenses.

SAN DIEGO COUNTY.

The Mines.—San Diego *Union*, Aug. 1: The Stonewall now 10-stamp mill started up day before yesterday. Defrees mill at Julian is running on Owens ore. Work is steadily going on on all the ledges. The McMechan mill in the San Felipe Cañon will start up on Monday on Golden Chariot rock. The Antelope will start about the same time.

SISKIYOU COUNTY.

Paying.—Yreka *Union*, Aug. 3: The claims on the East Fork of Scott river are paying better this season than ever before.

TUOLUMNE COUNTY.

Table Mt.—Sonoma *Independent*, Aug. 10: The Table Mt. Co. are going to work in 3 or 4 places on a large scale.

The Boston Co. have a good portion to work on the "front lead" before commencing on the "back lead."

Nevada.

ELKO COUNTY.

Pennsylvania.—Elko *Independent*, Aug. 10: The shaft being sunk is passing through another strata of superior ore. They are down 20 ft. on this new discovery without getting through it. it.

EUREKA DISTRICT.

In Operation.—Eureka *Sentinel*, Aug 8: The new furnace of the Silver West Co. has been in operation for a day or two.

New Furnace.—Supt. Daugherty is vigorously pushing matters connected with the erection of the new furnace for the Ruby Hill Cons. It is intended to have the works in active operation by the first of October.

Geddes & Bertrand.—This mine at Secret Cañon has several hundred tons of high grade ore on the dump. No. 1 15 stamp mill is to be erected immediately.

Items.—In the Excelsior a few days since an immense chamber of ore was broken into. In the Morris there are 3 shafts, each showing good ore, and about 90 tons are on the dumps. The El Dorado ore runs from $80 to $160 in gold, and from $200 to $300 in silver.

ELY DIST.

Local Review.—Ely *Record*, Aug. 4: Bullion.—During the past week W. F. & Co. have shipped bullion valued at $113,500.64. For the month ending July 31 the same Co. shipped bullion valued at $522,785.84, the heaviest shipment which has yet been made in a single month from this district.

Pioche.—Assays from face of drift on 110 level, and wings on same level have averaged during the past week $283. A great improvement is noticeable in the east drift on the lower level. The stopes continue yielding well. On the 30th ult. shipped bullion valued at $10,286.58.

Condor.—Face of drift looking much better than last week. The ledge shows fully 3 ft. wide, and the galena ore is running out, and chlorides show much more plentiful.

Ivanhoe.—During the past week have struck several stratas of rich ore; at 220 ft. are running a cross-cut to tap the vein.

Stirling.—Sinking shaft and making good progress. Ore in bottom has improved greatly during the week.

Harper.—Indications in bottom of shaft improve daily, broken ledge matter appearing in shaft as depth is attained.

Mocking Bird.—New contract to sink 50 ft. has been let during the week. Shaft has been timbered throughout and new and substantial ladders placed in mine. The ledge continues widening as sunk upon and shows fully 4 ft. in width, the ore showing solid about 2 ft. in width but is somewhat broken in the rest of the ledge, being of honeycomb kind of rock. From present indications a large body of ore will soon be opened up.

Fallis Tunnel.—Work will be resumed in a short time. At present it is in 45 ft.

Maggie.—Work will be started up again in a short time. The shaft is 143 ft. deep, with the ledge showing 3¼ feet wide on the bottom.

Page & Panaca.—The machinery of the new works being in position, steam was put on on Friday last, and everything was found to work smoothly. The shaft is cribbed in a substantial manner, from top to bottom.

Chapman.—Stoping and raising ore continues.

Newark.—Work will be resumed to-morrow.

Chief of the Hill.—Drifting and stoping on second level, and raising ore to surface. Have temporarily suspended work on lower level, having traced out the Burke Tunnel company.

American Flag.—Work of placing machinery in position is going ahead rapidly, and engine will be started up and work in mine resumed in about a week or ten days. The mill continues running steadily.

Newton Booth.—Will resume work in about ten days, and sink the shaft 400 ft. before drifting.

Meadow Valley. — Nos. 7 and 3 shafts continue to yield the usual quantity of ore. No. 5 on Summit shaft, is worked steadily.

Raymond & Ely.—Mine continues looking well throughout, and shipments to mill are daily being increased.

Long Valley Dist.—Only one ledge of considerable magnitude has been found. It shows on the surface 3 inches in width, but on sinking widens out. In one place, at 20 ft. down, the ledge has opened up to 18 inches wide, and prospects very rich.

Bristol Dist.—The National Co. are erecting a smelting furnace of the capacity of 20 tons of bullion every twenty-four hours, which will be completed about the 10th of Sept.

Jolly Traveler.—This mine is about 400 ft. south of the Alps. A shaft has been sunk about 30 ft. Mr. Barber is about letting a contract for sinking 100 ft. more.

HUMBOLDT.

White Cloud Dist.—Unionville *Silver State*, August 10: The Moonta copper mine is looking exceedingly well. The shaft is 75 ft deep, and they are drifting upon the ledge, which is about 3 ft. wide.

REESE RIVER.

Bullion.—Review—Reese River *Reveille*, August 3: The shipment for July, consisted of 51 bars, 5,305 lbs. valued at $74,930.85.

Saybrook.—Reese River—Working in the 150 ft. east level; running 2 shifts; have commenced getting some very good ore.

Saratoga.—Bevelhymer, who has a lease in the 160 ft. west level is getting splendid ore. From the 350 ft. levels large and constantly increasing quantities of highest grade ore is steadily coming out.

Iowa Tunnel.—Foxworthy & Co., are getting good chloride. Johnson & Woods are raising a chute from level No. 1 west; preparatory to hressting out. Graham & Co., are sinking an incline on the ledge from level No. 1, west; now down 50 feet; getting magnificent ore. Briggs & Co., are opening level No. 2. from the main tunnel; getting no ore at present. There is about 15 tons ready for shipment to mill.

South America.—Operations are to be resumed.

Lane & Fuller (Pacific Co).—Mine improving at all points; struck a large body of ruby ore on the Buel North Star ledge this week; 100 tons of ore on hand.

WASHOE.

Bullion.—Reno *Crescent*, August 3: During July there has been shipped coin to the amount of $102,718,.98; bullion from the English Mill, $12,627.53; gold dust, $1,370.00; total $116,-716.51. During the week, 6,509 lbs. passed through W. F. & Co.'s Reno office.

Yellow Jacket.—Local Summary—Gold Hill *News*: Daily yield 20 tons $27 ore from between the 900 and 1,000 ft. levels. The main incline is not being sunk deeper at present, owing to inefficient pumping arrangements. The 1,500-ft. station from the incline is opened and the main drift east from it toward the ledge is in 42 ft. The incline is in the hard west country rock. Last Tuesday a connection was made with the main drift north at the 1,300-ft. level, and the long incline from the 1,100-ft. level, giving splendid ventilation throughout. The main drift is being continued northward exploring for a good body of ore like that in the Imperial. About 300 ft. of this main drift has been completed since the 8th of last month, working at 3 different points.

Woodville.—Work goes on as usual. The result of the last clean-up of the mill, from 80 tons of ore, was $2,600.

Sutro Tunnel.—This tunnel has penetrated 2,995 ft. The rock is very hard in the face, but good progress is made. Work in the various air shafts along the line of the tunnel progresses.

Occidental.—The main tunnel at the lowest level is daily advancing northward as fast as possible. The tunnel is in the ore vein, and the assays show a continual improvement in value.

Jacob Little.—The ledge is found to be over 20 ft. wide and no west wall reached as yet. It shows constant improvement.

Gould & Curry.—The new hoisting engine was started up for the first time yesterday, and works perfectly. Sinking the incline progresses slowly, the rock blasting quite hard.

Hale & Norcross.—Daily yield about 100 tons: Work is stopped in the northern half of this mine on the lowest level. The incline is sunk 120 ft. below the lowest level, and work is going on vigorously.

Ophir.—Sinking the shaft was again resumed on Wednesday. The north drift on the 1,100-ft. level is being pushed ahead with vigor. The west drift on the 700-ft. level is 70 ft. in ledge matter, with occasional streaks and spots that give assays of a low value.

Con. Virginia.—The cross-cuts are in quartz on the 400-ft. level. The assays taken latterly from the new body show a regular average improvement.

Sierra Nevada.—Daily yield 55 tons good milling ore, with improvement in quality. The ore stopes in the upper mine are yielding finely. The ore holds out in the rise from the new body in the middle mine. The breasts on lower level are yielding about the same; and the prospecting drift north is making good headway.

Belcher.—Daily yield 260 tons. The ore breasts are looking finely. The yield for July was 5,000 tons, yielding $65, and amounting to $325,000.

Crown Point.—Daily yield about 300 tons. The water is all drained from the 1,300,ft. level, and as soon as everything is in proper working condition, rich developments may be looked for at that point.

Savage.—Daily yield, 175 tons, worth $27 per ton. The main drift south on the 1,500 to connect with the winze from the 1,400-ft. level progresses. The incline is down 120 ft. and progresses slowly.

Imperial-Empire.—Good ore was found a day or two since in the south drift, at the 1,500-ft. level, and it is being taken out for milling. At the 1,650-ft. level a winze is being sunk in the ore body, and it is drifted upon north 30 ft.

Utah.—The main shaft is sunk over 80 ft. below the old tunnel. Sinking is done very rapidly; the water being pumped out with great facility.

Overman.—The main shaft is down 30 ft. below the 1,100-ft. station. The drift west at the 1,100-ft level is in 525 ft., and the face is in very promising ledge matter.

Chollar-Potosi.—Daily yield 170 tons worth $38 per ton. Repairing the shaft continues with vigor and is nearly completed. The Belvidere, Blue Wing and other ore breasts are yielding the usual amount of ore, and all looking well.

Senator.—Work is dragging along slowly.

Silver Hill.—The pumps are placed in position on Tuesday, and have been in operation since. Sinking of the shaft progresses without interruption.

New York Cons.—A new boiler, engine and pump have been purchased, and will arrive.

Caledonia.—Prospecting in the old mine and at the 400-ft. level. The cross-cut and drift show no good pay ore as yet. At the 700-ft. level the west drift is in about 60 ft.

Knickerbocker.—The shaft is down about 60 ft. below the 400-ft. station, and the bottom is coming into stratas of clay and quartz. Some of the quartz is looking splendidly with spots of good ore in it.

Buckeye.—The ore breasts south of the incline look and yield well, and the sinking of the incline deeper progresses at a satisfactory rate. The bullion product for July footed up to $9,794, the ore averaging over $16 per ton.

Julia.—The shaft is down 890 ft. with a considerable increase of water at the bottom. The boilers of the new hoisting machinery are in place, and the foundation for the engine nearly completed.

Justice.—The old Waller Defeat shaft is yielding some very good paying ore, and the breasts show improvement.

Kentuck.—Daily yield 65 tons.

WHITE PINE.

Mines North of Shelburn.—Schell Creek *Prospect*, Aug. 3: The McMahon Co. is driving work with vigor. Twelve men are employed and will soon be in on an immense body of ore.

The Woodburn is pressing work with 12 men and taking out good ore. A mill will soon be built.

In the Summit they are taking out splendid ore.

In the Jupiter they have 50 tons on dump, and are working 2 men.

On the Hidden Treasure work will be resumed next week.

Neal & Bryant have splendind crops, from 30 to 40 ft. wide, and the ore will assay from $50 to $500 to the ton.

Mary.—They have taken out float, in their progress, which has assayed $1,400 per ton.

Schell Creek Con.—Eight hour shifts continue to run in their great tunnel, now in 160 feet.

Mines of South Shelburn.—Tehama Con. was sold 3 weeks since for $28,500; then one-sixth sold for $87,000; since which, one-twelfth sold for $30,000, or at the rate of $360,000. The company have purchased a 20-stamp mill and have contracted for it to be in running order in 90 days; 2 tunnel are being pressed, one in ore, the other in debris, to obtain greater depth. Besides the work going on in tunnels, men are engaged at 4 different points in taking out pay ore.

The Queen Springs Mines.—On the Great Western 12 men are prosecuting work. Their tunnel is in more than 150 ft. and still progressing. It will cut the vein about 200 ft. below the surface. They are taking out ore from their incline which will pay about $100 to $200 per ton.

Nutmeg.—Some 200 or 300 tons of ore are on the dump.

Centerville Dist.—On the Home Ticket 12 men are working.

Ruby Hill Dist.—For the Birch Co., 4 men are working in an open cut, 20 ft. in, showing a face of ore 20 ft. high. They started their mill on Thursday, and will immediately increase the capacity to ten ton, and will next week put on 15 more men.

Columbia Mine.—Driving work with a tunnel in 100 ft., and showing a fine body of ore.

Ferret.—Pushing work in a cut 20 ft. deep with rich ore at the bottom.

Treasure Hill Mines.—White Pine *News*, Aug. 3: Bullion.—Amount shipped this week is $18,061.40.

Beecher Con.—The shaft is 42 ft. deep, at the end of which an incline is running easterly 75 ft. From the bottom of the incline, east of a body of ore in which they are working is about 80 ft. They are breasting in ore north and south; the face of the ore-body is about 20 ft. wide and 30 ft. in depth. Running a drift north of east chamber to connect with the middle shaft. Commencing at the old Blasdel shaft, a drift has been run 112 ft. through ledge matter. The Edgar shaft is on the north end of the Co's mines, and is 112 ft. depth. From this shaft a drift has been run northerly about 35 ft., at the end of which an excavation has been made in ore—running north and east—the breast being 15 ft. deep and 40 ft. wide. Connections have been made with the Anchor tunnel, and numerous other drifts have been made for the purpose of prospecting the mine. The shafts and dumps are all completed, and they expect to be able to ship from both ends of the mines about 40 tons per day of first-class ore the coming week.

Eberhardt & Aurora Co's. Mines.—At the Eberhardt the whim has been completed, and they are sinking the shaft which is down 148 ft. The ore in the Risdale and DePass chambers in the North Aurora is improved in quality. In the north end of the Aurora the indications for striking a body of rich ore are good.

H. Treasure.—There is decided improvment in the grade of the ore in the lower tunnel.

San Juan Del Rio.—There is a decided improvement in the quality of the ore. Drifting over the ore will soon be commenced.

Sundeam.—Sinking in the Moscow shaft. The ledge on the south side of the shaft is 10 ft. wide, of which about one-half is good smelting ore. A shift is working in the east drift. Low grade ore in the drift, and the indications of striking high grade ore are favorable.

Silver Wave.—In the Boswell works greater improvement, and the ore which is being worked at the Swansea mill is turning out satisfactorily. Everything is working well in the No. 4 works, and drifting south.

Pennsylvania.—The Jackson shaft is down about 60 ft., and work is progressing. Indications are favorable for getting ore soon.

East Sheboygan.—Ore of a very high grade has been struck in the southwest drift, and the indications are favorable that it will develop into a large body. Good ore continues to be extracted from the Exchange and Regent drifts.

Emerald Isle.—Running a drift east; have some rich ore on the dump, and assorting the same to ship to mill.

Pooonip & Othello.—Running east in the body of ore in the tunnel.

Mammoth.—Looking improved, and ore is being taken out to be milled.

Western Slope, White Pine Mt.—Trench. Working with an increased force, and looking better than at any previous time. Getting ready to ship to mill.

Outside Dist. — Schell Creek.—Quite a number of sales are being made, and the mines have improved since last week. The small 5-stamp mill is expected to start up shortly.

Robinson.—The Canton Co.'s furnace started up on Wednesday, running steady and turned out 26 bars by Thursday morning. In the Canton and Watson mines more gold has been discovered in the rock than was anticipated. In the Canton a fine body of milling ore 15 ft. wide, mixed with carbonates.

Arizona.

Items—Mohave Co.—Prescott *Miner*, August 2: Work upon the copper mines at Williams Fork, is progressing favorably.

Yuma Co.—Castle Dome miners are waiting for cool weather, when active operations will be commenced. Considerable placer mining is being done, with paying results.

Maricopa Co.—Preparations are making to commence work on the Silver Queen and other mines.

Yavapai Co.—Tiger, Del Pasco, and a few other lodes in the Bradshaw region are opening out better and better. Plenty of rich ore on various dumps.

Colorado.

Clear Creek.—Central *Register*, July 31: The Grass Valley P. M. Co., Clear Creek Co., are about to commence active operations.

Cooper & Co., at their gulch claim, South Clear Creek, are taking out $10 per day to the man. Their shaft is almost 45 ft. deep, and they have a drift 45 ft. in length which they are running on good pay-dirt.

The placer claims in Russel, are panning out handsomely. Wm. Queen's claims last week, yielded at the rate of 2½ ozs. to the man.

Central.—Central *Herald*, July 31: Bennett, Smith, Sullivan, and Nichols have a whim up and at work on the Central City Lode. The shaft is 90 ft. deep and sinking is going on rapidly.

Montana.

Yielding Well.—Deer Lodge *New North West*, Aug. 3d: The Trout ore is holding up to expectations, the yield averaging about $136 per ton. A lot of 607 lbs. of bullion was taken out on Sunday.

Utah.

Star.—Pioche, (Nev.) *Record*, Aug. 4th: A number of new locations have been made in Rocky Dist., some of which are turning out well and as work progresses the ore increases in value. The Hickory, of North Star, continues to be the main attraction. The Shenandoah has a shaft 50 ft., and have about 60 tons of ore on the dump, that is considered to be worth $100 per ton. Assays from the latter have been obtained as high as $1,600; the Empire and Linsey are looking well; the Matilda has a vein 3 ft. wide; the Midas has about 40 tons of ore on the dump, assays from which went $4,800; the Washington is highly spoken of. In this Dist., it is said, they are anticipating the erection of two quartz mills.

Good Result.—The superintendent of the Calaveras Mill Co. gave the Paul Process some work to do last week, by way of testing its merits in working 6½ tons of highly concentrated sulphurets, containing more or less lead and zinc, with the sulphurets of iron. The test was highly satisfactory inasmuch as 83 per cent of the value of the highest assay in gold and silver was produced and the bullion came out 990 fine. If by this process we can continue to get bullion as fine and so high a per cent of assay value, the question of its universal adoption is only one of time.

United States Mining Laws and Regulations Thereunder.

[Continued.]

50. Upon the foregoing heing filed within the sixty days as aforessid, the register, or in his absence the receiver, will give notice in writing to *both parties* to the contest that snch adverse claim hss been filed, informing them thst the party who filed the adverse claim will he required within thirty dsys from the date of snch filing to commence proceedings in a court of competent jurisdiction, to determine the question of right of possession, and to prosecute the same with reasonable diligence to final jndgment, and that should sucb adverse clsimant fail to do so, his adverse claim will he considered waived, and tbe spplication for patent he allowed to proceed npon its merits.

51. When an adverse claim is filed as aforcsaid, the register or receiver will indorse upon the same the precise date of filing, and preserve a record of the dste of notifications issued thereon; and thereafter all proceedings on the spliestion for pstent will he suspended, with the exception of the completion of the publication and posting of notices and plat, snd the filing of the necessary proof thereof, until the controversy shall have been adjudicated in court, or the adverse clsim waived or withdrawn.

52. The proceedings after rendition of judgment hy the court in such case are so clearly defined hy the act itself as to render it unnecessary to enlarge thereon in tbis place.

PLACER CLAIMS.

53. The tenth section of the act under consideration provides "that the act entitled 'An act to amend an act granting the right of way to ditch and canal owners over the public lands, and for other purposes,' approved July 9, 1870, shall be aud remain in full force, except as to the proceedings to obtain a patent, which shall he similar to the proceedings prescribed hy sections six and seven of this act for obtaining pateuts for vein or lode claims, hut where said placer-claims shall he upon surveyed lands and conform to legal subdivisions, no further snrvey or plat shall be required, and all placer-mining claims hereafter located shall conform, as nearly as practicahle, with the United States system of public-land surveys snd the rectangular subdivisious of such surveys, and no such locations shall include more than twenty acres for each individnal claimant; but where placer-claims cannot he conformed to legal subdivisions, snrvey and plat shall be made as on unsurveyed lands," etc.

54. The proceedings for obtaining patents for veins or lodes having already been fully given, it will not be necessary to repeat them here; it being thought that careful attention thereto by applicants and the local officers will enahle them to act understandingly in the matter and make such slight modifications in the notice, or otherwise, as may be necessary in view of the different natnre of the two classes of claims, placer-claims heing fixed, however, at two dollars and fifty cents per acre, or fractional part of an acre.

55. Tne twelfth and thirteenth sections of said act of July 9, 1870, reads as follows:

SEC. 12. *And be it further enacted*, That claims, usually called "placers," including all forms of deposit, excepting veins of quartz, or other rock in place, shall he subjected to entry and patent under this act, under like circumstances and conditions, and upon similar proceedings, as are provided for vein or lode claims: *Provided*, That where the lands have been previously surveyed by the United States, the entry in its exterior limits shall conform to the legal subdivisions of the public lands, no further survey or plat in such case being required, and the lands may be paid for at the rate of two dollars and fifty cents per acre: *Provided further*, That legal subdivisions of forty acres may he subdivided into ten-acre tracts; and that two or more persons, or associations of persons, having contiguous claims of any size, although such claims may be less than ten acres each, may make joint entry thereof: *And provided further*, That no location of a placer-claim, hereafter made, shall exceed one hundred and sixty acres for any one person or association of persons, which location shall conform to the United States surveys; and nothing in this section contained shall defeat or impair any *bona fide* pre-emption or homestead claim upon agricultural lands, or authorize tbe sale of the improvements of any *bona fide* settler to any purchaser.

SEC. 13. *And be it further enacted*, That where said person or association, they and their grantors, shall have held and worked their said claims for a period equal to the time prescribed by the statute of limitations for mining claims of the State or Territory where the same may be situated, evidence of such possession and working of the claims for such period shall he sufficient to establish a right to a patent thereto under this act, in the absence of any adverse claim: *Provided, however*, That nothing in this act shall he deemed to impair any lien which may have attached in any way whatever to any mining claim or property thereto attached prior to the issuance of a patent.

56. It will be ohserved that that portion of the first proviso to said twelfth section which requires placer-claims upon surveyed lands to conform to legal subdivisions, is repealed hy the present statnte with regard to claims heretofore located, hnt tbat where snch claims are located previous to survey and *do not* conform to legal subdivisions, survey, plat, and entry thereof may he made according to the boundries fixed hy local rule, hut that where such claims *do* conform to legal subdivisions, the entry may he effected according to such legal subdivisions without the necessity of further snrvey or plat.

57. In the second proviso to said twelfth section authority is giveu for tbe subdivisou of forty-acre legal subdivisons iuto *ten-acre* lots, which is inteuded for the greater convenience of miuers in segregating their claims both from one another and from iutervening agricultnral land.

58. It is held, therefore, that under a proper construction of the law these ten-acre lots iu mining districts should he considered and dealt with, to all intents and purposes, as legal subdivisous, and that an applicant having a legal claim which conforms to one or more of these ten-acre lots, either adjoining or cornering, msy make entry thereof, after the usual proceedings, without further survey or plat.

59. In csses of this kind, bowever, the notice given of the application mnst he very specific and accurate in description, and as the forty-acre tracts may he subdivided into ten-acre lots, either in the form of squares of ten hy ten chains, or of parallelograms five hy twenty chsins, so long as the lines are parallel and at right angles with the lines of the pnblic snrveys, it will be necessary thst the notice and application state specifically what ten acre lots are sought to be patented, in addition to the other *data* required in the notice.

60. Where tbe ten acre subdivision is in the form of a square it may he described, for instance, as the "S. E. ¼ of the S. W. ¼ of N. W. ¼," or, if in the form of a parallelogram as aforesaid, it msy he described as the "W. ½ of the W. ½ of the S. W. ¼ of the N. W. ¼ (or the N ½ of the S. ½ of the N. E. ¼ of the S. E. ¼) of section ——, township ——, range ——," ss the case may he; hut, in addition to this description of tbe land, the notice must give all the other data thst is reqnired in a mineral application, hy which psrties may he put on inqniry ss to the premises sought to he pstented.

61. The proceedings necessary for tbe adjustment of rights where a known vein or lode is embrsced hy a plscer-claim, are so clearly defined in the eleventh section of the act as to render any particular instructions upon that point at this time unnecessary.

62. When an adverse claim is filed to a placer application, tbe proceedings are tbe same as in the case of vein or lode claims, already described.

TRICHINA SPIRALIS.

QUANTITY OF PLACER GROUND SUBJECT TO LOCATION.

63. By the twelfth section of said amendatory act of July 9, 1870, (third proviso,) it is declared "that no location of a placer-claim hereafter made shall exceed one hundred and sixty acres for any one person or association of persons, which location shall conform to the United States surveys," etc.

64. The tenth section of the act of May 10, 1872, provides that "all placer-mining claims hereafter located shall conform as near as practicahle with the United States system of public-land surveys, and the rectangular snbdivisions of such surveys, and no such locations shall include more than twenty acres for each individual claimant."

65. The foregoing provisions of law are construed to mean that after the 9th day of July, 1870, no location of a placer-claim can be made to exceed one hundred and sixty acres, whatever may he the number of locators associated together, or whatever the local regulations of the district may allow; and that from and after the passage of ssid act of May 10, 1872, no location made hy an individual can exceed twenty acres, and no location made by an associatiou of individuals can exceed one hundred and sixty acres, which location of one hundred and sixty acres canuot be made by a less unmher than eight *bona fide* locators, hut that whether as *much* as twenty acres can he located by an individual, or one hundred and sixty acres hy an association depends entirely upon the mining regulations in force in the respective districts at the data of the location; it heing held that such mining regulations are in no way enlarged hy said acts of Congress, but remain intsct and in full force with regard to the full size of locations, in so far as they do not permit locations in excess of tbe limits fixed hy Congress, hnt that where such regulations permits locations in excess of the maximums fixed hy Congress as aforesaid, they are restricted accordingly.

66. The regulations hereinbefore given as to the mauner of marking locations on the ground, and placing the ssme on reeord, must he observed in the case of placer locations, so far as the same are applicahle; the law requiring, however, that where placer-claims are upon *surveyed* public lands, the locations must hereafter be made to conform to legal subdivisions thereof.

67. With regard to the proofs neccesssry to establish the possessory right to a plscer-claim, the said thirteenth section of the act of July 9, 1870, provides thst "where said person or associstion, they and their grantors, shsll hsve held and worked their said claims for a period equal to the time prescribed by the statute of limitations for mining claims for the State or Territory where the same may he sitnated, evidence of snch possession and working of the claims for snch period shall he sufficient to establish a right to a patent thereto under this act in the absence of sny adverse claim."

68. This provision of law will grestly lessen the hurden of proof, more especially in the case of old claims locsted many years since, the records of which, in msny cases, have heeu destroyed hy fire, or lost in other ways during the lapse of time, but concerning the possessory right to which all coutroversy or litigation has long heen settled.

69. When an applicant desires to make his proof of possessory right in accordance with this provision of law, you will not require him to produce evidence of location, copies of conveyances, or abstracts of title, as in other cases, but will require him to furnish a duly certified copy of the statute of limitations of mining claims for the State or Territory, together with his sworn statement giving a clear and succinct narration of the facts as to the origin of his title, and likewise as to the continuation of his possession of the mining ground covered by his application; the area thereof, the nature and extent of the mining that bas heen done thereon; whether there has heen any opposition to his possession or litigation with regard to his claim; and if so, when the same ceased; whether such cessation was caused by compromise or hy judicial decree, and any additional facts within the claimant's knowledge having a direct hearing upon his possession and *bona fides* which he may desire to submit in support of his claim.

70. There shonld likewise be filed a certificate nnder seal of the court having jurisdiction of mining cases within the judicial district embracing the claim, that no suit or action of any character whatever involving the right of possession to any portion of the claim applied for is pending, and that there has been no litigation before said court affecting the title to said claim or any part thereof for a period eqnal to the time fixed by the statute of limitations for mining claims in the State or Territory as aforesaid, other than that which has heen finally decided in favor of the claimant.

71. The claimant should support his narrative of facts relative to his possession, occupancy, and improvements hy corrohorative testimony of any disinterested person or persons of credibihty who may he cognizant of the facts in the case and are capahle of testifying nnderstandingly in the premises.

72. It will he to the advantage of clsimants to make their proofs as full and complete as practicable.

APPOINTMENT OF DEPUTY SURVEYORS OF MINING CLAIMS—CHARGES FOR SURVEYS AND PUBLICATIONS—FEES OF REGISTERS AND RECEIVERS, ETC.

73. The twelfth section of the said act of May 10, 1872, provides for the appointement of surveyors of mineral claims, authorizes the Commissioner of the General Land-Office to establish the rates to be charged for snrveys and for newspaper publications, prescribes the fees allowed to the local officers for recciving and acting upon applications for mining pstents snd for adverse claims thereto, etc.

74. The surveyors general of the several districts will, in pursuance of ssid law, appoint in each land district as many compctent deputies for the survey of mining claims as msy seek snch appointment; it being distinctly understood that all expenses of thcse notices and snrveys are to he horne by the mining claimants and not by the United Ststes; the system of msking *deposits* for mineral surveys, as required hy previons instructions, being herehy revoked ss regards *field-work*; the clsimant having the option of employing *any* deputy surveyor within such district to do his work in the field.

75. With regard to the *platting* of the claim and other *office-work* in the Surveyor General's office, that officer will make an estimate of the cost thereof, which amount the claimant will deposit with suy United States sssistant tressurer, or designated depository, in favor of the United States Tressnrer, to be psssed to the credit of the fund created by "individual depositors for surveys of the pnblic lands," and file with the surveyor general duplicate certificates of snch deposit, in the nsual manner.

76. The surveyors general will endesvor to appoint mineral deputy surveyors, as rapidly ss possible, so thst one or more may he located in each mining district for the grester convenience of miners.

77. The usual oaths will be required of these deputies and their assistants as to the correctness of each survey executed by them.

78. The law requires that each applicant shall file with the register and receiver a sworn statement of all charges and fees paid by him for publication of notice and for survey; together with all fees and money paid the register and receiver, which sworn statement is required to he transmitted to this office, for the information of the Commissioner.

79. Should it appear that excessive or exorhitant charges have been made hy any surveyor or any pnhlisher, prompt action will be taken with the view of correcting the abuse.

80. The fees payable to the register and receiver, for filiug and acting upon applications for mineral-land patents, made under said act of May 10, 1872, are five dollars for each officer, to he paid by the applicant for patent at the time of filing, and the like sum of five dollars is payable to each officer by an adverse claimant at the time of filing his adverse claim.

[To he Continued.]

Trichina Spiralis.

A great stir is heing made because the trichina has been discovered in a Chicago ham at San José. There is prohably no doubt as to its being the true trichina spiralis, an animal that, if it once gains admission to the human stomach, is pretty certain to cause inconvenience, if not death, sooner or later. It is ascertained that in two days after their iutroduction into the stomach they attain their full sexual maturity, and in six days after the young are disseminated by millions throngh every part of the muscular system.

The young trichina, as they are found in the human muscle, appear as represented by figure 1 in our illustration; as a worm coiled up in small oval or elongated cysts, harely visihle to the eye.

The perfect worm, fully grown, represented by figure 2, rarely exceeds the two-hundredth part of an iuch in length, so small, indeed, that a single ounce of flesh has been estimated to contain 325,000 trichina; and yet their countless numhers produce the terrihle disease called *Trichiniasis*.

The numerous outline figures of our engraving are merely to show the various positions they are found—by aid of the microscope—to assume while occupying each its own distinct cyst or pouch imbedded in the flesh. The hog seems to he the animal most likely to be infested hy this nematoid or thread-like worm, being conveyed to the stomach in the filthy garhage often fed to this animal.

Prof. J. B. Edwards, at a meeting of the American Association for the Advancement of Scieuce, held in Salem, Msss., stated, that if meat containing trichina is beated to 212°, the hoiling point of water, the worms will he effectnally killed, aud the meat will not injure the consumer.

Prof. Agassiz followed by saying, he hoped the appetite of the community would not be distnrhed hy this scientific discussion, as snch worms are present in all meats and even many vegetahles, and there is no danger if they he properly cooked.

But so far as our people are concerned, as the trichina has never yet been found in California cured ham or bacon, we would recommeud its exclusive use in preference to any, in regard to which a snspicion may rest. California ham and eggs will continue one of the staple hreakfasts of the *genus homo* of this coast for a long time to come, hut to those who may prefer the Eastern article, our advice would be to call for it *well cooked*.

Useful Information.

Recent Earthquakes.

Prof. Rockwood gives notices of shocks this year in the *Amer. Jour. Sci.*

1. Jan. 16.—An earthquake almost entirely destroyed the city of Shamaka, Russia, a place of 25,000 inhabitants, lying at the southern base of the Caucasus Mts., and about 75 miles west of the Caspian Sea. Over 100 persons are reported killed, and scarcely a building in the city left standing. The shock was felt over a large extent of the surrounding country.

2. Feb. 6, 8 A. M.—Three slight shocks, lasting altogether about 30 seconds, the vibrations from the N. N. E., were felt at Winona, Michigan.

3. Feb. 8, about 5 A. M.—Slight shock at Cairo, Illinois.

4. March, 6 P. M.—Shocks felt simultaneously for over an hour at Dresden, Pirna, Schandau, Chemnitz, Bodenbach, Weimar and Rudolfstadt, in Germany.

5. March 26. — Earthquake in California. [This has been spoken of at varlons times in this paper.—Eds. Press.]

6. March 26.—Slight shock at Paducha, Kentucky, also one at Salt Lake City, Utah. These may have been part of the Inyo earthquake.

7. April 3, 8 A. M.—Severe earthquake destroyed a large part of the ancient city of Antioch, in Syria. The shock lasted over 40 seconds, and the wave traveled from east to west. Lighter shocks followed at irregular intervals for a week. The number of persons killed is estimated at 1,000 to 1,600.

8. April 16, 17 and 18—A series of violent shocks reported at Hasvick, Iceland. Twenty houses destroyed, several persons injured, but no lives lost.

9. The recent grand eruptiou of Mt. Vesuvius is interesting, as being possibly connected with the phenomena recorded above. This eruption first assumed noticeable proportions on the night of April 24, when a flow of lava was added to the flames and smoke which had for months adorned the sumit of the mountain. On the night of the 25th, a chasm opened in the side of the cone, from which issued a torrent of lava; the whole occurring so snddenly as to overtake and destroy a number of the spectators who were watching the eruption. The flow of lava continued two or three days, overwhelming two villages and buried a considrable extent of cultivated land. The eruption finally ended with a shower of stones and volcanic sand which fell in the streets of Naples to a depth of several inches; the eruptiou was attended with the usual local trembliugs of the earth.

Disturbances Anlicipaled al Mt. Hecla.

In connection with the above the following from the *Scotchman*, will not be without interest:—"Inferences drawu from the late eruption of Vesuvius, the great hurricane on the coast of Africa at Zanzibar, and volcanic disturbances and phenomena in the Malay archipelago, California, Japau, Syria, and other portions of the earth's surface, had led some of our best scientific authorities to believe that an eruption of Mount Hecla in Iceland may be expected at an early date. Should this occur during the summer season a full description may be expected to be received, as there is at present a considerable number of travelers from this country to Iceland. Besides Captain Burtain and his party, who are examinging the sulphur deposits in the vicinity of Hecla and the other volcanic masses in the Island, others are collecting geological, oruithological, botauic, and other specimens, wbile one gentlemau is exploring the country with the purpose of writing a topographical description of it.

The African Fly.—One of the most extraordinary facts revealed to us hy Dr. Livingstone's explorations in Africa is that the high table land of the interior, with its rich agricultural resources, its noble flora, its fine temperature, broad inland seas, and inexhaustible stores of mineral wealth, is rendered all but impenetrable to civilized mau, certainly beyond all reach of colonizatiou, by one of the most apparently insignificaut of causes—a fly. This terrible insect is a little, brown, yellow-striped fly, called the tsetze, scarcely larger than our common household pests, but whose sting is absolutely fatal. So deadly is its poison that it is said three or four flies will kill the largest ox. Soon after the hite, which gives little or no pain, staggering and blindness comes on; the body swells to an enormous size; the coat turns rough, and in a few hours follow convulsions and death. And yet this deadly poison, under the effect of which the horse and ox, the sheep and the dog, fall as if plague-stricken, is perfectly harmless to man, to wild animals, to the pig, mule, ass and goat. Here is an achievement for science that would bring glory to the discover—the discovery of some antidote to the sting of this venomoue fly, which would open the treasures of Central Africa to the use of the world.

Cheapest Process for Making a Safe Oil.—Prof. Chandler, in the *American Chemist*, says the cheapest process for making an oil that will not flash, that is, emit an inflammable vapor, below 100° Fahr., is the following: 1. Run off the naphtha down to 58° B., instead of 65° to 62°, the usual point. 2. Then expose tho oil in shallow tanks to the sun or diffused daylight for one or two days. The increased expense of this plan of refining would not reach more than three or four cents per gallon,

Artificial Marble.

The *Engineer* describes how an excellent imitation of marble is made in London at a small expense. The marblo is the so-called Marezzo marble. A large sheet of plato glass is first laid horizontally on the tablo, then a skein of tangled silk, knotted at the opposite ends and soaked in coloring matter, is pulled out into a rough rectangular form, the rectanglo being crossed in all directions by the tangled threads, and laid upon the piece of glass, the knots lying beyond the edges of the glass. This first skein is colored to form, say, tho blue veins; then another skein, soaked in other coloring matter, may be laid over it to form other veins. Then some Keen's cement lightly colored, is sprinkled over the skeins with the fingers to further add to the marbling effect, and after two or three sprinklings, it may be of different colors, the silk is quite covered by the wet layer of cement. Then the silk is pulled out by being lifted vertically upwards through the cement. More cement is then added, and the mass is smoothed by a trowel. Next, some fine cement is laid on, and over this a layer of canvas to give strength to the film, now about a sixth of an inch thick. Then comes a thick backing of coarse cement, making the whole five-eighths of an inch thiek. On turning up the slab of plate glass, and looking at the face of the layers of cement, as fine a specimen of marble is secn as anybody need wish to view, all made in a few minutes. It is left on the glass twelve hours to dry, and is afterwards enameled and polished. It is not impossible that many a householder who thinks he has a fine marble mantelpiece might, by boring a little helow the surface, be somewhat surprised to come upon a layer of canvas inside the stone.

Blood as Food.—Attention having been drawu by Professor Panum, ot the University of Copenhagen, to the amount of nutritious matter contained in blood, and usually entirely lost, Mr. Nielsen, of that city, bas been endeavoring to solve the problem of fixing blood in forms suitable for food, and at the same time capable of preservation, namely: (1) as sausages, puddings, cakes, (being mixed with fat, meal, sugar, salt, a few spices,) to serve as a much cheaper compensation for meat, and intended more especially for the use of the poorer classes; (2) as blood-chocolate, morc especially suitable to be used in hospitals, and otherwise in medical practice, in which latter form it has been recommended by Professor Panum, at a meeting of physicians at Copenhagen, and is now being employed at the hospitals of Copenhagen, the attention of physicians being diidirected to its effects. In these different forms it would be suitable for the victualing of vessels on long voyages, of besieged towns and fortresses, and, especially in the chocolate form, of soldiers on long marches, travelers ia uncivilized tracts, etc.

Growth of Nails.—M. Dufour has made observations as to the rate of growth of the nails. Here are some of the results: The nails of the little fingers grow more slowly thsn those of the other fingers and the thnmbs. The difference is abont one ninth. The mean rate of these (excluding the little fingers) is about one millimeter (100th part of an inch) in ten days. The rate of growth on the thumbs is probably greater than that on the six longer fingers. There is little difference between the rates of growth in different animals. The nails grow at about the same rate on both hands. The rate of growth is not ceustant throughout the length of the nail; it is greater uear the base. The rate of growth at the side parts is probably the same as in the middle part. The substance of the nail advances equally throughout its breadth. The rate of nail growth in an individual at intervals of several years shows sensible differences.

Insoluble Glue.—The liability of glued articles to come to pieces when exposed to the action of water, especially hot water, is familiar to every one. By adding to the water, with which the glue is mixed when required for use, a small quantity of bichromate of potash, and afterwards exposing the part to which it is applied to light, the glue is rendered insoluble, and the articles fastened with it resist the action of water. The proportion of bichromate of potash to be taken must be determined by experiment, but for most purposes one-fiftieth of the amount of glue required will be sufficient.

Testing the Richness of Milk.—It is said that the richness of milk may he quickly and easily tested by placing the milk between two plates of glass so arranged that one may be made to approach to or rocede from the other by meane of a screw, placing behind the plates the flame of a stearine candle, or any other standard light, and obscrving the point at which it is rendered invisible on separating the glass platee. This point, when compared with the permanent line indicating the best milk is the measure of the richness of the sample.

Cement roofs are coming into very extended use in Prussia. The cement is ground in steel mills and laid on with a thickness of only one-eighth of an inch. The roof is therefore a light one, weighing less than eight pounds to the square foot. With German prices, the cost is fifty-two cents to the square foot.

Good Health.

Taking Cold in Warm Weather.

Many people think there is no danger of taking cold when the weather is very warm, and expose themselves in various ways when overheated, fatigued, or sweaty. This is an erroneous idea—destructive to life and health. When the system is fatigued with exercise, overheated or sweating, great caution is necessary to guard against taking cold. Some people say they never take cold, and have no fear of taking cold. But are they never ill in some form? O, yes; but they do not cough, and conclude they do not take cold.

Colds no not effect all people alike. All do not cough that have been exposed to cold; but the insensible perapiration cannot be suddenly checked without injury to people and animals. Hence it is dangerous to drink cold drinks when one sits down to rest, though if exercise is continued, they may be partaken of in small quantities with benefit. The systems of men and animals that exercise must not he rapidly, but gradually cooled.

Horses ought not to be watered when abont to stop exercise, either in warm or cold weather. This practice subjects thom to disease and often destroys their lives.

More than twenty-five years since, I read in "Cutter's Physiology" that when people were warm with exercise, or from other cause, they ought to throw something over their shoulders on sitting down to rest. An observance of this rule, has, I am satisfied, saved me much sickness. If men would put on a coat when resting, or after work at night, it would save them many bad feelings, sickness, and sometimes death.—*Moore's Rural.*

Mortality as Affected by Marriage.—In a paper read by M. Bertillon before the Academy of Medicine of Paris, the anthor—using as evidence the statistics of France, Holland, and Belgium—strongly maintained the healthful influence of conjugal association as compared with that of celibacy. The figures show that, between the ages of 20 and 35 years, 1,000 married men furnish six deaths; 1,000 bachelors 10 deaths; aud 1,000 widowers, 22 deaths. From 30 to 35 years of age, the same classes, respectively, furnish 7.11 and 17¼ deaths. From 35 to 40 years of age, the mortality is 7½, 13, and 17⅛ per 1,000 respectively. And so on in a series of tables for all ages, the married man has greater longevity than the single man. The same advautage of the married state obtains in the case of females, though up to the age of 80 the difference is not so apparent as in the other sex. From 30 to 35 the mortality is 11 per 1,000 for single women, and only 9 per 1,000 for married women, and this difference increases up to the age of 55. Thus from 50 to 55 years of age, 1,000 wives furnish only 15 or 16 deaths, while as many single women or widows furnish 26 or 27. This advantage remains very notable beyond that age, dimiuishing hut little. In France, however, under 25, and in Paris, under 20 years of age, marriage is far from favorable, but even injurious, as also in the case of males. The mortality of unmarried girls of from 15 to 20 is 7.53 per 1,000; the mortality of wives of the same age being 11.86. The mortality of girls from 20 to 25 is 8.32; of wives of the same age, 9.92.

Importance of Ventilation.—In an emigrant ship ou one occasion, during a violent storm, the captain, in order to keep the decks clear and facilitate the working of the ship, sent the passengers into the hold, ordered the hatches to be fastened down, and kept them in that state all night. In the morniug, when the hatches were removed, the hold was found to be full of the dead and dying.

A modified form of this state of things is to be found in many a house in every town—where partial murder is done night after night; and the result is shattered health. The body loses its tone and is reduced to that state in which it falls an easy prey to any infectious disorder, the seeds of which may be floating about in search of a fertile germinating bed.

Every man should be made to understand that he requires not less than 150 or 160 cubic feet of fresh air every hour, and that he should not use over again what has once passed through his lungs, till, like fowl water, it is cleansed by filtration. People should be taught to fear polluted air more than draughts—which would amount to a total reversal of the present belief; for we now see a general preference for the former. In this respect men might cull a lesson from the beee, who, while they highten the temperature of the hive, do it not at the expense of healthful condition. Their mode of ventilation is perfect.

Supposed Cause of Sea-Sickness.—Dr. Anderson of London, writing in the *British Medical Journal*, coneiders sea-sickness to depend on an impression on the brain equivolent to a blow, given by overy lurch or descent of the ship. In other words concussion of the brain is virtually the cause of sea-sickness.

Reported Specific for the Yellow Fever.—The English Consul at Cuidad Bolivar, Venezuela, has reported to his government that a cure for the yellow fever has been accidentally discovered in that place—the specific is the juice of the Nervine plant.

The Difference Between Disgusting Odors and Odors of Fever Poisons.

In a communication to the *Lancet*, Mr. Buée, of Slough, calls attention to the great difference there is between stinks and poisons. He says: "Stinks may or may not be organic, and may damage health; but fever poisons are organic, have a life, a growth, will produce their like, and, if planted in favorable soil, grow, run their course, live their natural life, die out, and leaving seed behind them, reproduce themselves; and, above all, have no smell. A boy who has never had scarlatina gets into a railway carriage in which an infected person has traveled; he smells nothing, yet takes the disease. A well attended person suffering from that disease or any other, has a scentless room; yet an incomer predisposed, though not smelling anything, takes the illness. The scabs from small-pox and cow-pox have no smell, yet they will not inoculate.

The fact is, though as yet we cannot see the germ, our microscopes and means not being at present sufficiently powerful, yet common-sense and reasoning from the habits of these poisons tell us, I think plainly, that they are organic and inodorous. And if so, what should we do besides draining and ventilating? Why, decompose, disinfect and destroy the vitality of the germ, never allowing it, if once cast into the closet, to get again into the atmosphere alive. Chloride of lime, carbolic acid, and last, not least, though cheapest, solution of sulphate of iron, which last, I believe, gives out much ozone, and is as good a destroyer of germs as anything I know. Let one of these he used constantly in all closets, sinks, and drains. These poisons do not necessarily require a human body for their growth: they will grow on a dunghill or in a cesspool, wherever there is a favorable uidus, like fungi."—*London Pharm. Journal.*

What Kind of Food Must We Eat.

Resistant solid material, as well as elements of nourishment, are essential in food. Neither cattle nor horses could be kept alive long on fine flour, meals, or graius of any kind. Mixed, however, with grass, dry bay, or straw, they thrive. The walls of the stomach and bowels must be kept apart by solid material, on which friction may be exerted, in order to have perfect digestion. A dog lived twenty-one days, the only survivor of a wrecked vessel at sea, closely shnt up in the cabin, by eating the thick, strong wood and leather binding of a Bible, while experiments with dogs fed on soft food, as gelatine, thin soup, etc., proved that they could live a single week on such diet.

Those persons whose diet is rather coarse, as bread of unbolted flour, large fruit eaters, bread and milk people in the country, etc., are exempt from the pains of dyspepsia. Those sustained mostly ou very fine, concentrated, delicate food, washed down with tea, are gaunt in form, weak in muscle, and always taking medicine. Their food shonld have more bulk and solid, hard ingredients.

A poor man's family uever lack for an appetite with a crust of brown bread. His neighbor's darlings, snrfeit on rich cakes, highly seasoned dishes and nurtured in luxury, are the life of doctors and druggists. So says science.

Poison from Scratching.—It is not from any poison inherent in the nails of a hnman being, or the claw of a bird or animal, that produces the poisonous effects somotimes experienced from a human or animal scratch. It is the dirt that is collected under them, and which cleanliness requires should be often removed, that causes the mischief. It is a kind of innoculation of impurities, and this, of course, produces the legitimate result in accordance with the kind of impurity which has become innoculated. The scratch of a person who keeps his hands carefully clean never irritates much, while that of a dirty hand may have serious results. We had recently in the papers a report of a man who died of the results of a scratch of his own dog's paw, and the doctors were discussing if this dog had not hydrophobia. They should have simply cleaned the dog's nails, and seen what kind of dirt he had between them. This man mnst have had a predisposition or great sensitiveness for poisonous matter thus introdnced. In perfectly healthy persons such matters are usually driven out by inflammation and suppuration, and the patient's vitality gains the victory.

Hereditary Influences.—It is distinctly asserted by Prof. Lucas, and agreed to by others, that predisposition to any form of disease, or any malformation, may become an inheritance. Thus disease of the heart is hereditary; so are tubercles in the lungs; so also are diseases of the brain, of the liver, and of the kiduey; so are diseasee of the eye and of the ear. General maladies are equally inheritable, and gout and madnees. Longevity on the one hand, and premature death on the other, go by descent. If we consider a class of peculiarities more recondite in their origin than these, we shall find the law of inheritance to hold good. A morbid susceptibility to contagious disease, or to the poisouous effects of opium or of calomel, and an aversion to the taste of meat, are all to be fouud inherited. So is craving for drink, or for gambling, strong sexnal passions, a proclivity to pauperism, to crimes of violence, and to crimes of fraud.

MINING AND SCIENTIFIC PRESS.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY, GEO. H. STRONG,
W. B. EWER, JNO. L. BOONE.

Office, No. 338 Montgomery St., S. E. Corner of California St., diagonally across from Wells, Fargo & Co.'s.

SUBSCRIPTION AND ADVERTISING RATES.

ADVERTISING RATES.—1 week.	1 month.	3 months.	1 year.
Per line..... .25	.80	$2.00	$5.00
One-half inch.....$1.00	$3 00	7.50	20.00
One inch..... 2.00	5.00	14.00	38.00

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper, inserted at special rates.

SUBSCRIPTIONS payable in advance—For one year, $4; six months, $2.50; three months, $1 25. Clubs of ten names or more, $3 each per annum. $5, in advance, will pay for 1½ year. Remittances by registered letters or P. O. orders at our risk.

English and Colonial subscriptions, post paid, per year, £1 8s.; 6 months, 12s. Advertisements, per line, first insertion. 1s.; subsequent insertions, each, 6d. Large advertisements at special rates.

ILLUSTRATIONS AND REPORTS OF MINING ENTERPRISES WANTED.—Drawings or photographs of mining works that are of general interest to our readers are solicited for publication in this journal. Official reports of Companies, and description of mines of importance, of special interest, are also desired. Sketches of any new method and discoveries will be very acceptable.

San Francisco:

Saturday Morning, Aug 17, 1872.

Gold and Legal Tender Rates.

SAN FRANCISCO, Thursday, August 15, 1872.—Legal Tenders buying, 87¼; selling, 87¾. Gold in New York to-day, 115.

Table of Contents.

EDITORIALS.—An Observatory in the Sierras, Page 97. The Yellow Jacket Fire; Improved Metallic Tubular Harrow; Hope Gravel Mine, 104.
ILLUSTRATIONS.—The Diamond 97. Trichina Spiralis, 102. The Hawley Kiln, 105.
CORRESPONDENCE.—Notes of Travel in White Pine Co., Nevada; Mining Correspondence, 98.
SCIENTIFIC PROGRESS.—Contortion of Rocks; Improved Manufacture of Homogeneous Metals; Production of Ozone; Historical Lessons from a Brick; Odor of Plants, 99
MECHANICAL PROGRESS.—Siemens' Steam Jet; Relative Merits of Rubber and Leather for Belts; Influence of Cold upon Iron; Portable Railway for Common Roads, 99
MINING SUMMARY from various Counties in California, Nevada, Arizona, Colorado, Montana, and Utah, 100-1.
USEFUL INFORMATION.—Recent Earthquakes; The African Fly; Cheapest Process for Making a Safe Oil; Artificial Marble; Blood as Food; Growth of Nails; Insoluble Glue; Testing the Richness of Milk, 103.
GOOD HEALTH.—Taking Cold in Warm Weather; Mortality as affected by Marriage; Importance of Ventilation; The Difference Between Disgusting Odors and Odors of Fever Poisons; What Kind of Food Must We Eat; Poison from Scratching; Hereditary Influences, 103.
DOMESTIC ECONOMY.—How to Give Dinners; Yellow Pickle; To Bottle Green Gooseberries; A Receipt for Yeast; Practical Receipts, 108.
MISCELLANEOUS.—United States Mining Laws and Regulations Thereunder, 102. Observations of a Practical Miner; Mining in Central Asia; The Silver Mines of Georgetown, Colorado, 106. Patents and Inventions; New Incorporations; Meetings and Elections, 108.

LONGITUDE OF SAN FRANCISCO.—The latest official result arrived at from the discussion of the telegraphic longitudes between San Francisco and Greenwich, places the longitude of the United States Coast Survey Observatory in Washington Square, at 8 hours, 9 minutes, 38.32 seconds west of Greenwich. The calculation between this place and Cambridge, has been accurately computed by aid of the telegraph lines across the continent, and the difference between Cambridge and Greenwich has lately been corrected by means of the Atlantic cables. At Mr. Tennent's observatory on Russian Hill, a little west of the Washington Square observatory, the longitude is increased by these calculations to 8 hours, 9 minutes, and 39.51 seconds. If any further corrections are made, they will not probably amount to more than two or three-tenths of a second.

THE S. F. CHRONICLE.—This paper is to be enlarged, printed upon new and improved type, with a "Hoe rotary, four-cylinder, double quarto," Press, capable of striking off 20,000 copies per hour. Their immense increase of patronage requires the improvements.

QUICKSILVER.—We doubt whether knowledge of the fact that quicksilver has advanced to 87½ cents per pound, will be particularly interesting news to the mining community; nevertheless, such is the case.

A DISPATCH from Elko states that excitement in the Silver Zone District runs high, and valuable mines are being discovered daily.

ON FILE.—"The Silver mines of Peru;" communication from H. E.; "Notes of Travel in White Pine County."

Coal and Iron.

Coal and iron are the motive powers of the world, and the nations which possess the greatest and most easily accessible deposits of them will in future rule the earth. The immense demands that manufacturing industry is now making on the coal and iron production of the old world is tasking it far beyond its presumed capacity, and the inequality between supply and demand will increase rather than diminish as the years pass on. Land after land is being overspread with its net work of railroads, and countries already possessing extensive railroad systems are making such additions year by year as to render them almost as numerous as common country roads. Yet the greater part of South America, Central America, Mexico and numerous European colonies in various parts of the world are in regard to the development of their railway systems as much behind hand as was the United States fifty years ago. For the next few years they will all be making fast demands on the industry of the iron miners and the iron founders of the world. Then there is India, which at a no distant period will possess as extensive a railroad system as the United States does now; also China, which is beginning in this matter to throw off the trammels that custom and a respect for the institutions of antiquity has so long imposed, and many other countries altogether inactive in this respect now, which will help to largely swell the general demand.

The demands of iron for railroad purposes, great as it has already become, is only one of the many sources of demand which will hereafter tax the energies of the producer. Ere two score years have elapsed the commercial marine and the navies of the world will have been changed to iron from wood. The exhaustion of the great forests of Canada and the United States, as well as the total inability of the plantations of England and other European countries to furnish the necessary supplies of lumber, will render this material so dear as to turn the universal attention of ship builders to the procuring of some cheaper and more abundant one. This they will find in iron, as indeed already some of them have so found it. The plates for 10,000 ships can be cast from the same mould as readily as those for one, hence their aptness. Most of he ship yards of England are even now to a great extent occupied by iron ships in process of building. England is changing the character of her mercantile marine with marvelous rapidity, and the United States, if she hopes to be able to compete with her great rival for the carrying trade of the world, must follow the example. The mercantile marine of both nations aggregate at least 100,000 vessels of all classes, the number of which is daily increasing to an extent commensurate with their commercial importance. Only think of what a vast additional quantity of iron will have to be dug from the mines of the world to supply the demand arising from this source only. Then in general manufactures the use of iron is gaining to an extent that twenty years wae even undreamed of. Moreover these manufactures from the workshops of England, France, the United States and Germany are finding thousands of markets now-a-days where formerly they only found hundreds.

The consideration of the immensity of the needs of the coming railroad system, of ship building, and of general manufactures will readily convince our readers of the vast additional supplies of iron ore that will be needed. The statement of a few facts in connection with iron production will also show this. In England, at the present time, mine owners have orders for supplies of iron which it will take them fully eighteen months to meet. And this, notwithstanding the production of English pig iron has increased over 38 per cent. since 1864. The demands of railroads in Russia, Turkey, Hungary, Germany, Sweden, India, the Australian colonies and South America, combined with the increase of iron ship yards on the Tyne and the Clyde were so great as to create in conjunction with other causes a rise of Glasgow pig iron 60 s. per ton in 1870. At this time the stock of pig iron was very limited indeed. The stocks in Cleveland iron were not more than a month's make, while those in Scotch pig iron were not more than three months. Since then more supplies have become continually less and less, notwithstanding the vast increase in production, and now there are none. England, however, has enough for her own consumption at any time, inasmuch as she now exports 10 per cent. of her whole production; but we are not so happily situated.

The capacity of our furnaces this year is about 2,150,000 tons, of which we will require 966,000 tons for railroad purposes. This will leave us only 1,184,000 tons for all other purposes, and being supplemented by an import from England, equal to that of last year, or we shall have only 1,784,000 for all other purposes connected with our multitudinous and rapidly expanding manufactures. This will not be enough, and the result will be that the price of iron will continue to rise. It has fallen in this market during the last six or seven weeks; but the coming months must bring a rise again. The reduction in the hours of labor, and the increase of workmen's wages has tended also to give an impetus to the iron market, and the influence exerted by this cause is likely in the future to be greater still.

The development in the production of pig iron has caused, of course, an increased demand for coal, and so great has this demand been in England that she is now compelled to import from Belgium. We, here on the Pacific Coast, being supplied mainly from Australia and from home sources, neither of which can be much disturbed by the cause just mentioned, will not experience such a change in the price of this indispensable article as will England and the rest of the United States, but our market will be affected, nevertheless. We must certainly expect to pay more for our mining machinery and the products of our foundries generally unless we can discover on this coast extensive deposits of iron ore and beds of coal of sufficient good quality to supply the needs of our workers in metal.

The Yellow Jacket Fire.

It will be remembered that a few months since quite a discussion was carried on among some of the papers on this Coast, as to the origin and cause of the fire in the Yellow Jacket mine some three years since, by which a large amount of property was destroyed, and a number of valuable lives lost. Serious charges were brought against a certain gentleman prominently connected with the mining industry, and great interest was manifested by the public in the subject. The names of several well known people were connected with the affair, and, although it was supposed by many, that the vague rumors which were set afloat at the time of the fire, were being revived from personal, political and speculative motives, it was, nevertheless, considered worthy of investigation by the Grand Jury of Storey county. That body after a complete investigation, have failed to gather any facts which would show that the fire was caused by the act of any person known to any of the witnesses. One witness in particular, who claimed to have information which would tend to show that the mines were purposely set on fire, was carefully examined, and the verdict of the jury is, "that we are convinced that his statements are without foundation, and unsustained by any other witnesses, and seemingly the result of personal malice towards parties by whom he conceived himself to have been maltreated."

As to the matter of unusual quantities of powder having been taken into the mine just previous to the fire, the testimony failed to prove that any more powder was put there at any time than was necessary for daily working of the mines. It is to be hoped that this decision will set the matter at rest forever, and that we will have no recurrence of charges and counter-charges, which, to say the least, are insults to the judgment and morality of the people of this Coast; since if there were any truth in the assertions, they should be immediately made the subject of judicial investigation, and the community would not rest until the parties who committed so foul an act as to sacrifice a number of fellow beings, merely to gain certain financial points, were disposed of in a very summary manner. The possibility that such persons would be allowed to go free because of their wealth or social position, only aggravates the insult. We hope never to hear anything more of this affair.

COTTON MACHINERY FOR CHINA.—Messrs. Treadwell & Co., of this city, have furnished a steam engine and a complete cotton mill for China, which has already been shipped from this port to Hong Kong. The proper supplies also accompanied the same. Thos. Wood, of Philadelphia, is the manufacturer of the machinery, and sold the same by reason of advertising in the PRESS.

Improved Metallic Tubular Harrow.

Among the many patents that have been allowed through the SCIENTIFIC PRESS Patent Agency, on farming implements, is one to James Herris, on a metallic tubular field harrow, some of which are now being manufactured at the San José Foundry, Santa Clara County, and at the City Iron Works in this city. This improvement consists in constructing the frame of the harrow of metallic pipe. The tubes are held together by passing iron rods through the transverse tubes and through the sides of the longitudinal tubes, which are drawn together by nuts on the ends of said rods. An end piece, or washer, of peculiar construction is used to provide a bearing for the transverse tubes against the longitudinal ones.

Although much attention has been given to improving other farming implements, the harrow, until lately, seems to have remained the same. In many places in Scotland, however, the wooden barrow has been entirely discarded and given place to the iron one, the latter being preferred by the best farmers of that country as being better for pulverizing the soil and covering the grain; but the principle upon which they are made being expensive and requiring considerable trouble, they are not much known in other parts of this world.

In this tubular harrow the beams and cross bars are suitably made and finished at the first process of manufacturing the iron, consequently little labor is needed to join the frame work together; for that reason a good durable iron harrow can be made with steel teeth at less cost than a wooden one with iron teeth, and it can at the same time be made light or heavy, large or small, to suit different soils. As to durability, an implement of this kind made of the materials used ought to last a generation without any care in any country. Arrangements are being made to supply the demand for the coming season, and the proprietor proposes to dispose of manufacturing and county rights. It can be seen at the City Iron works, where mechanics, manufacturers and others are invited to examine it.

Hope Gravel Mine.

The stockholders of this company will be glad to learn that after so long a time, and such a large outlay of money in the shape of assessments, that they have at last found what the old Alta Co. No. 1 and 2 found on the same hill some years since. Report says the latter company took out of the ground, which has now been purchased by the Hope Gravel Company, some $500,000 in two years.

Mr. C. W. Ham has had charge of the mine for three years, and with the assistance of Mr. John Cunningham, the underground foreman, has worked the whole thing to the best advantage in the interest of the stockholders. They have run several thousand feet of bed-rock tunnel from the shaft, and have been amply repaid by finding deposits of rich pay gravel. In the last three months they have opened up a large body of good paying gravel, which has produced in the last sixty days up to July 31st, about 300 ounces. The last clean up ending August 10th, 1872, from eight days' run, produced 248 ounces of gold, worth $17 per ounce, or $4,216.

The working shaft is 240 ft. deep. The cement and gravel are all crushed through an eight-stamp mill, and go through the same process as quartz. The company are now working a breast of 40 feet in the main tunnel, and the pay streak is from one and one-half to three feet. The superintendent promises large returns to the company as soon as he can get the drifts run so as to put on a large force of miners.

The trustees anticipate paying their first dividend very soon on 12,000 shares, as they are assured that the next run will be much better than the last. This stock has been assessed somewhere in the neighborhood of $100,000, and the founders of the company who still retain an interest in it, will be glad that the day of assessments is at an end. The Altona mine, on the same hill has the same kind of deposit, but it is now idle for want of means. The news from the Hope Company will doubtless inspire its stockholders with renewed confidence.

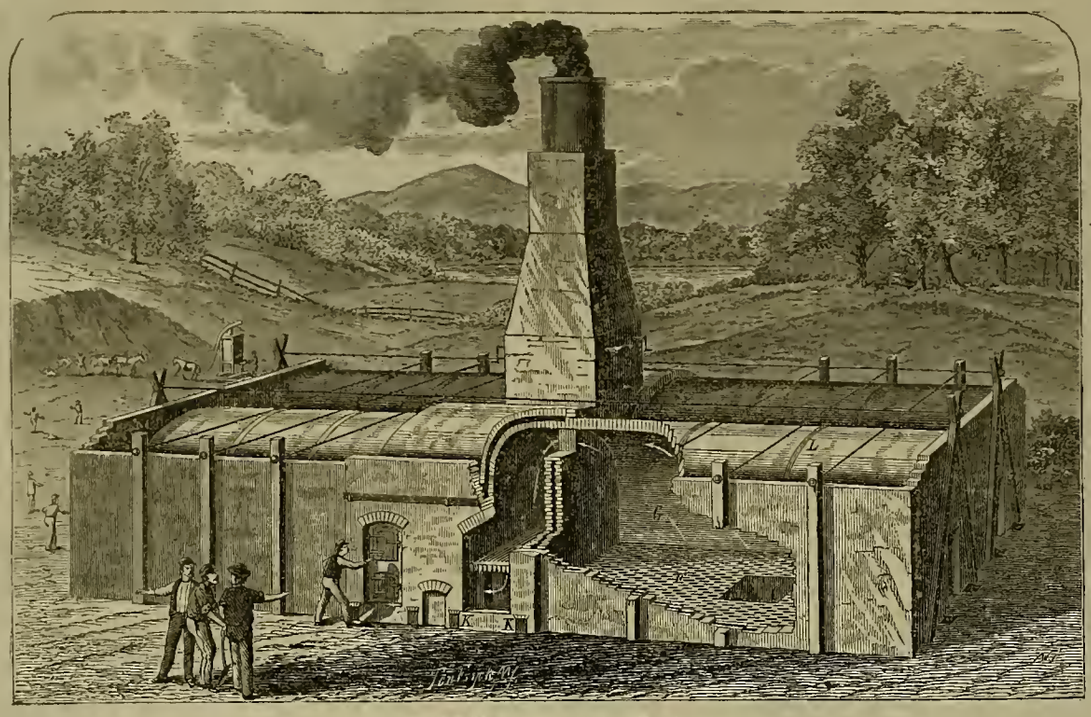
THE EXCELSIOR MINE.—Some very rich specimens from this mine may be seen at the office of Messrs. Travis & Wagner, No. 41 First street, who hold a controlling interest in the mine. The ledge is situated in Kelsey District, El Dorado county, Cal., two miles northeast of the St. Lawrence. A shaft has been sunk 70 feet on the lode, which averages 2½ feet in thickness. The footwall is porphyry and the hanging wall slate. Three working assays of the ore average $19 per ton in gold. The last working test made by G. W. Strong, No. 10 Stevenson street, in this city, yielded at the rate of $31.25 per ton; the rock worked being taken as it came from the shaft.

The Hawley Brick Kiln.

Among the more important recent inventions at present attracting public attention, we find the Hawley Kiln—by it or some similar method, the entire art of burning brick, tile, pottery, etc., must become revolutionized.

In the old-fashioned way of burning (from below, upward) there are two serious obstacles to a satisfactory end; the unavoidable and excessive expense for fuel, and imperfect results under the best management.

The mode of operation of this kiln completely inverts the traditional method. By it the products of combustion are introduced into the top of a close burning oven, while exhaustion is effected from the bottom, thus practically confining all the heat to its legitimate work and securing uniform exposure of the contents of the burning oven and avoiding the production of clinkers, benches and pale bricks.



HAWLEY'S PATENT KILN—FIG. 1.

To illustrate the *modus operandi:* Fig. 1 represents a perspective view, showing the left hand anterior chamber in process of burning, while a part of the walls of the right hand chamber, furnace, and floor, is broken away in order to show something of the internal arrangement, (a piece of the floor has been left out in chamber *G*, to show the situation of condensing well, *C*, underneath). Fig. 2 is a vertical section, with arrows showing the course of the currents during the process of utilization of heat. Fig. 3 is a diminished foundation plan, showing the locations of the wells for retaining condensed steam and ducts leading from the chimney. Fig. 4 represents a portion of the permanent floor of the burning chambers, showing the construction and mode of support.

(To illustrate the manner of burning the first chamber, refer to Fig. 2, left hand furnace and oven, isolating in imagination this part from the rest of the drawing. The course of the arrows, beginning at the ash pits, shows the direction of the currents during burning).

The room, *A*, is filled with green material, and the chimney damper, *D*, opened. The cold air draft to feed the fires in the furnace enters (through openings, *K K*, seen in Fig. 1) on each side of the ash pit doors, and rises in appropriate vertical flues until it enters the open space between the double arch over the furnace; thence it passes downward between the double side walls of the furnace, and enters the ash pit under the grate bars.

During the progress of burning, the furnace walls become intensely hot, and the incoming fresh air, by contact with these walls, during its transit to the grates becomes so highly heated as to ignite all the smoke and gases generated from the fuel (whether wood or coal), thus securing almost perfect combustion.

The products of combustion rise upward in the furnace, *B*, and enter through the opening (in the direction shown by the arrows) into the burning chamber, *A*. Having no avenue of upward escape, the heated air spreads itself in a level stratum throughout the top of the chamber, displacing and expelling at the same time an equivalent in bulk from the bottom of the room into the sub-chamber or condensing well, *C*, situated underneath the floor of the burning oven, from which it escapes up the chimney flue, controlled by the damper, *D*.

During the process of burning, the incoming heated air generates steam freely from the green material contained in the oven; this steam gravitates in a level stratum, is condensed below (thoroughly saturating the material), and acts as a sort of *automatic damper*, which resists or retards the closely following or descending stratum of ignited gas which, at a white heat, is thus caused to expend its force completely, above; for while the steam damper prevents the escape of heat, at least above the steam point (212 Fah.), it does not materially obstruct the natural draft.

This task of retarding the descending stratum of intense heat until after it completes the burning process, through and below, the lowermost courses in the burning chamber, is effected by providing the sub-chamber or well, *C*, under the floor, *F*, of the oven, in which the descending steam is received, condensed, and retained in sufficient quantity to effectually arrest the escape and consequent loss of heat until the process of burning is completed.

In the burning material requiring extraordinary and prolonged exposure to intense heat (fire brick, etc.), he finds it necessary sometimes to furnish an artificial supply of water in this well, to be generated into steam (damper) and thus check for a longer time the escape of heat up the chimney.

In treating peculiarly refractory clays, particularly fire clay, requiring prolonged and steady exposure to a white heat, Mr. Hawley adopts a slight modification of the method above described, in order to save the fuel, otherwise expended in vaporizing the artificial supply of moisture in the well.

He connects chimney flue, *I*, with cross duct, *J*, (opening controlled by a damper) and from cross duct, *J*, into either furnace.

By this means, when the "water smoke" is dried off from previous chamber, and the contents of the room throughly heated, and its chimney damper, *D*, shut off, (thus stopping direct escape up chimney) he turns the draft through duct, *J*, into another furnace, and its adjoining chamber and chimney flue, to dry in advance the contents of the next room to be burned.

To illustrate the utilizing process, we again refer to Fig. 2, where we will imagine the process, just above described, as having taken place in chamber, *G*, instead of *A*; therefore, the right hand chamber is now filled with a glowing mass of hot material. The left hand chamber, *A*, is filled with green material. The damper, *D*, to chamber *G*, is closed, thus closing the outlet from the under floor into the chimney. The damper, *D*, of the chamber, *A*, is opened, the dampers controlling the communication between the ash pits, *I*, of the furnaces are opened, the direct draft dampers are shut (see *K. K.* Fig. 1), and the dampers at *E*, for the cold air inlet under the floor of the hot oven, are opened.

By the course of the arrows, it may be seen, the inventor takes all his draft in at *E*, and converts the incandescent mass contained in the oven, *G*, into an enormous furnace, passing this heated air over into the chamber, *A*, and thus using it at the proper stage for a hot blast, and under the furnace, *B*, and at the same time cooling rapidly and safely the contents of *G*. In cases where it becomes necessary to continue the exposure of the lowermost courses to white heat, an equal length of time with the top courses, the inventor, instead of utilizing by reversing the current from *E* backward, and thus cooling bottom courses first, shuts opening *E*, and damper, *D*, and continues direct draft, as at first through *K*, *K*, moving the currents in a continuous spiral direction, from the furnace through, oven and across duct, *J*, into the next furnace and oven, to be burned, and from thence into its appropriate chimney escape.

By means of the sub-duct, *J*, connecting all the ash pits, the heated air may be transferred to either of the burning chambers at discretion; or by a prolongation of the sub-duct, *J*, outward, any desirable amount of heated air may be conveyed to the outside structures for drying or other purposes.

Taking into consideration the value of the improved quality of stock turned out and the saving in fuel effected, it is claimed that the Hawley kiln makes a difference of at least two dollars per M. in the production of common brick, and the difference is still more evident in making the finer grade of "front" brick.

The kiln is in operation upon the works of the Adamantine Brick Press Co., Rochester, N. Y., and at the yard of Messrs. Cocks & Barlow, Croton Landing, N. Y.

For further information address A. R. Morgan, 103 Fulton St., N. Y.

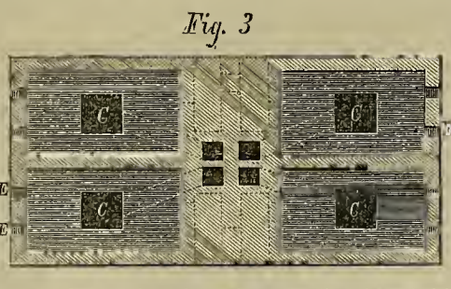

Fig 4

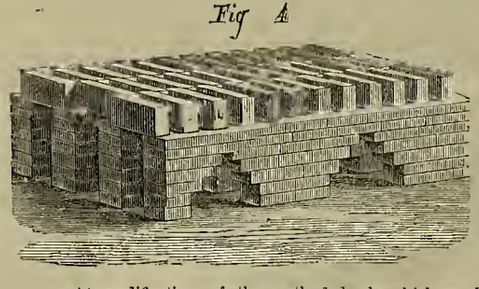


Dr. Payne's Scientific Lectures.—Dr. Payne, of St. Louis is giving an interesting course of lectures on medical and social topics at Platt's Hall. He will lecture on Monday evening next to ladies and gentlemen on "Self-made Men and Women." The Doctor is the author of a number of books which may be had at the Russ House.

Redington Quicksilver Mine.—A fire which occurred in the Redington mine on the 4th inst, destroyed the timbers in the shaft, (which was 150 feet deep,) two engines and the hoisting works. It is said there is sufficient ore on hand to keep the reduction works busy until the damages are repaired. The loss is estimated at between $20,000 and $30,000.

DOMESTIC ECONOMY.

How to Give Dinners.

The size of the party is a matter of consequence. Party is a nonn of most indefinite multitude. Some numbers arrange well a table—some ill. Six, ten, fourteen are favorite numbers. They balance symmetrically and give a proper alternation of sex. But as a general rule it should he set down that the "little dinner party" shall not comprise more than ten. But given six or ten well selected, judiciously grouped people, a round table, a moderate temperature, sufficient light, and a good dinner, and what further provocatiou does mortal man need to make him agreeable?—if agreeability within him lies.

The dinner need hy no meaus be elaborate. Soup, fish, a joint of poultry, and a pretty dessert, with hright conversatiou hy the way of sauce, is sufficient for any small party. And a dozen such in the course of a year do more toward cementing friendliness and extending our hospitable influence than any number of "swell" repasts from a confectioner's, or eveu than a hiennial jam of the most recherche kind, presided over by Brown or furnished hy Iauch.

Every table should have a center—and that center should not stand too high. Be it fruit, flowers, or confectiouery, its top should he helow the level of the eye. Nothing interferes with talk to much as to be forced to dodge this way and that to catch a glimpse of one's opposite neighhor. There should not he too much on the table at a' time. A crowded look destroys elegance. The eye demands space as well as the elhow. Two vegetables with each course are sufficient.

Hot plates, iced water. Blessed duo! Temperature should be studied by every housekeeper. It is all-important and within the reach of all. A cold plate makes a good dinner bad, and a had one horrible. A hot plate (which costs nothing) improves everything. A hot room dulls and stupefies. Conversation wilts with the flowers.

If the dinner service be white it can be enlivened hy various little touches. The napkins may hoast a scarlet initial or monogram. Folded napkins with similar letters in the center may be laid to receive the dishes in lieu of table-mats. Fiuger-howls may he arranged to form groups of prettily contrasted tints. Flowers in the center, or heside the plate of each guest, are prettiest of all. Nothing leuds such grace to food as flowers.

A delicate finish should characterize each detail, and a certaiu amount of ornament. Every dish is susceptible of heing made pretty as well as eatahle. A bunch of parsley, a circle of sliced lemon, vegetables cut into pretty forms, potato, rice, hread-crumbs, quilled paper, adjuncts neither troublesome nor expensive, may be made to give a look of elegance to simple fare. Above all things, perfect and dainty neatness, hest ornament of all, and that cordial home-atmosphere which confers savor even upon a dry crust.—*Scribner's Monthly.*

YELLOW PICKLE—WILL KEEP FOR YEARS.—One pound race ginger—lay in water over night—in the morning scrape and cut it in thin slices, rub it thoroughly with salt and let it stand in the sun to dry. Take two ounces of long hlack pepper and prepare in the same way; one pouud of garlic cut in thin slices and salted; let it stand three days; then wash it well, ealt it again, and let it etand three days longer. Then wash, drain, and put in the sun to dry. Take a quarter of a pound mustard seed, brüised, and two ounces of tumeric; put all these ingredients, when prepared, into a large stone jar with a gallon of good cider vinegar; stir it daily for ten or twelve days; keep it closely tied; into this pickle you may put cabbage, cauliflower, small cucumbers, melons, heans (snaps), and very young ears of corn. The cabbage must be firm, white heads, small, quartered, and laid in salt and water for three days; then boil fresh salt aud water and scald the cahhage; press out the water aud lay it in the sun to dry. The other fruits and vegetahles must be prepared in the same manner. Care must be taken that the iugredients are well dried before they are added to the viuegar. The jar need never he emptied. You can add the fruits and vegetablee from year to year as they come in season and supply the vinegar as it is required.

TO BOTTLE GREEN GOOSEBERRIES.—Remove the steme and blows, aud allow about a half pound of sugar to a pound of herries. If you wish them whole, you will need a little water. Put a layer of sugar and goosherries, and so on, and then water nearly to cover them, hut not quite. Put the fruit into the bottles hy the teacupful. Take them from from the kettle solid iu the cup, hut allow some of the hoiling juice, or they will chill. Have the hottle full of the berries, and then cover with whatever quantity of the boiling juice is necessary. If you want them made into jam, let them stew until a pulp is formed, and use no water. Ripe gooseherries are hetter made into a jam; a httle less sugar tban for the green ones is required.

TO DRY CITRON OR WATERMELON RIND.—After preserving place in the sun and dry. They answer well in puddings and cakes as a substitute for the imported citron.

MISCELLANEOUS.

Observations of a Practical Miner.

ENS. PRESS:—If two mineral veins of the same composition dip toward each other so as to form a junction at a ccrtain depth, the intersectiou usually causes a great change for better or worse. The vein and surrounding strata, for many feet, are sure to present a disturbed and contorted appearance, after which the two may continue iu their own course; or one, heing strouger, may take the other along with its course, afterward forming one vein; or perchance hoth may be destroyed. Also if two veins intersect each other at right angles the stronger is certain to pass through the weaker; sometimes a total destructiou is the resnlt, or the lode may he displaced—"heaved,"—and geuerally at right angles.

I visited a mine in Great Britian where a rich and massive vein of copper ore, at the intersection of another vein or cross course, was thrown to the right, at a right augle, 600 feet. This disturbance perplexed the managers, and caused a vexatious delay; but when discovered it was not an iota decreased in size or value.

Wherever there is a vein dipping parallel or with the hill wherein it is emhedded, near the surface, so that a cross-cut can intersect it at the depth of one, two or five hundred feet, and iu nearly the same number of feet, such a vein will be found almost without an exception unproductive, and will continue so until it arrives at the foot of the hill, so that it can be covered hy a greater amount of the surrounding formation. When, if it continues in depth, it will generally be found profitahle.

Some veins dip many hundred feet without a variation, and all of a sudden turn in a contrary direction, owing to some freak or convulsion of Nature, or perhaps to a sudden hardeniug of the stratification. When such an event occurs, the vein will generally be a champion one, otherwise it would he ohliterated, for such a change is too great for a weak or diminutive one, which would split up aud scatter in every direction.

Frequently veins are pinched as it were into a space of a few inches, or even to only a mere line of division of the rock hy a sudden change of the strata; hut they usually widen out again to their former size, in depth or distance. Such veins have strength and when expanding, favorable results may be looked for.

When it is desired to prospect for other veins or deposits, at a considerahle depth in a miue, cross-cutting hy drifting is the only alternative, and should he prosecuted more frequently. In doing so, wheu iu proximity to a veiu which has streugth or indication of permanency, the strata always dips with the vein, uotwithstanding prior to the approximation the strata may dip contrawise. If the whole appear as if disturbed, and the divisions or interstices of the rock dip in every direction, and contiuue so until it assumes the parallel declination of the vein, the rocks will be thiuly disseminated throughout with particles of mineral characteristic of the vein. With such symptoms no doubt need be entertained; whereas, if none of those signs are present, no true vein or large deposit of mineral is near. T. S.

Mining in Central Asia.

Peculiar Iron Smelting.

Mr. Shaw, British Commissioner in Ladak, says *Van Nostrand*, in his "Visits to High Tartary, Yarkand and Kashgar (formerly Chinese Tartary), gives an interesting account of the primitive metallurgical processes in a country undouhtedly rich in underground wealth. From him we learn that the iron-smelting furnace is just like a dice-box, four or five feet high, with a roof over it, leaving an exit in the middle for the smoke. Rouud the dice-box, under the roof, sit six hoys and girls hlowing skin-bellows with each haud, 12 hellows in all. Au opening shows the glowing mass, with a stream of molten stuff slowly oozing downwards. A pit, two feet deep, showe the bricked-up door of the furnaces through which the metal is extracted daily. The ore is broken up hy a man with a hammer, who keepe throwing it in at the chimney, while another supplies coal through the same opening. No third subetance. Sixteeu pounds of ore aud the same quantity of charcoal are used in the twenty-four hours, and the produce is a little over three ponnds of iron. The metal is very good and fine grained, looking almost like steel when made up into tools. The molten metal is allowed to cool for a whole uight before the furnace is opeued. The ore is a hlack-looking stone, got by diggiug from the mountains 15 miles off

Mineral Products of Turkistan.

In Turkistan the most valuable production is Jade. The quarries are in lat. 36° 18′ N., and long. 78° 15′ E. The other mineral productions are copper, iron, lead and gold. The copper is said to be got uear Oksooi. The iron is got from the Kizil Tagh (Red Mts.) to the west of Yarkand, and is worked in the villages of Tohlok Kizil. Lead is got in some of the valleys near Sarikol. Koten is famous for its gold, of which there are several mines uuder the mountains uear Kashagar. At Kiria shafts are sunk to some depth to reach the auriferous beds, of which the earth is brought up to the surface and washed in cradles. Coal is reported found in the jungles east of Yarkand and douhtless exists in the mountaius of Andijan uear the town of Oosh.

The Silver Mines of Georgetown, Colorado.

This flourishing town is situated in an outspread cañon—about 8,500 feet above the level of the sea—the mountains that surround it are from 2,000 to 4,000 feet higher. The silver lodes are found in these lofty mountains. It is a well-established fact that the richest silver mines are those on high mouutains. Thus the famous miues of Potosi, in Mexico, are worked at an elevation of 13,000 feet. This miue has produced over one thousand millions of dollars worth of silver. Our best mines are at an elevation of from 9,000 to 10,000 feet.

There is no sign of our silver mines running out, as it is well kuown that many of the Mexican mines have been worked for over 500 years and are still productive—there is no evidence on record that any silver mine has yet been exhausted in a downward direction. The silver bearing rock is supposed to be 12,000 feet thick—a depth that will never be reached by the skill and energy of man. We are sometimes asked the question—"How many mines are there in Clear Creek county? We cannot answer this question now, but we will be able to answer it after some time. In the Rocky Mountain Directory for 1871, we find the names of 318 mines in Clear Creek county. But that is scarcely the half of our mines that are now either fully or partly opened. Then there are hundreds that are yet unopened, so we may put dowu the number at perhaps 1,000, and perhaps another 1,000 to be discovered. An old citizen of Clear Creek county has informed us that there are between 10,000 and 11,000 mines recorded in the County Records. This of course exceeds all our ideas of the number of mines in our county. Many of those mines are no doubt worthless, and will never be worked. But what are these mines worth? That is a question too, that cannot be answered now in a satisfactory manner, as only a few of our mines have beeu so far opened as to show what they are worth.

The Pelican, the Maine, the Laura Dale, the Snow Drift, the Silver Plume and the Terrible have been so far opened as to show immense stores of wealth. And hundreds of others would no doubt turn out as well if opened to the same extent. But silver mines, no matter how rich they are, will not open themselves—brains, muscle and money are needed to develop them. The last census gives the whole valuation of Colorado at $24,000,000. Our impression from what we have seen is that the silver mines of Clear Creek county alone are worth twice that amount.

In order to encourage the miners aud operators in Clear Creek county to press on with their work, we give a few well authenticated facts as to the yield of silver in othes places. The Veta Madre vein in Mexico, has already yielded upward of $235,000,000; and the Veta Grande vein of Zacatecas, has in about 300 years produced the enormous amount of $950,000,000! One mine in Mexico, called Paulleon, is said for a long time to have produced $20,000 worth of silver a day. It is said the Comstock lode, in Nevada, yielded in thirteen years, over $60,000,000, and in 1866, there were taken from that lode $16,500,000 worth of silver!

If our mines come any where near those now mentioued, we may form some idea of what our thousands of mines may produce when they are fully opened and worked with wisdom and energy.—*Colorado Miner.*

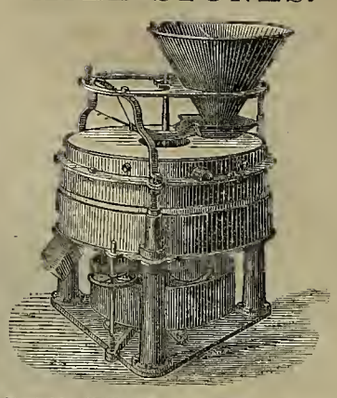
ENAMEL FOR COOKING UTENSILS.—An enamel for copper cooking utensils ie made hy fnsing together 12 parts white fluor-spar, 12 gypsum and one part horax, and dissolving the mass in water to a thick paste which is applied as a paint to copper vessels and when dry this rendered adhesive hy heing thoroughly haked.

SINGULAR INSTINCT.—It is a very singular fact in connection with the instinct of the animal creation, that all the species of ants which store *seeds* for food bite off the radical and thue prevent the possibility of germination.

THE practice of insurance is of great antiquity, and was kuown in the time of Claudius Cæsar, A. D., 43.

SLEEPING rooms should be constructed with great care and strict regard to ventilation, as one-third of human life is spent in them.

MILL STONES.



Portable Mills, Eureka Smut Machines
Bran Dusters, Dufour & Co.'s Celebrated Dutch Anchor Bolting Cloths, and General Mill Furnishing.

7v24-t Placerville, Cal.

THE TANITE COMPANY,
STROUDSBURG, PA.,
Sole Manufacturers of
THE TANITE EMERY WHEEL,
And builders of Emery Grinders, Saw Gummers, Etc., Etc.
Emery Grinding Machines,
At $15, $30, $50, $75, and $110. DIAMOND TURNING TOOLS, $15 each.
SOLID EMERY WHEELS,
From 40 cents to $113 each.
Every IRON FOUNDER can save money by using these Wheels to grind the sprues and gates off of castings. Every MACHINIST can save money, files, and labor, by using them to shape his lathe tools, to grind off chilled edges, to finish nuts, etc., etc. Every BRASS WORKER can use them on Brass. Every WOOD WORKER can use them to gum his saws, to sharpen his planer knives, to make his moulding cutters. For illustrated circulars address THE TANITE Co., Stroudsburg, Monroe county, Pa.

BURLEIGH
ROCK DRILLS
AND
AIR COMPRESSORS.
The Burleigh Rock Drills, which have stood the test of five years constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequalled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunnelling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground, or compressed air when under ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being applied.
Send for illustrated pamphlet to
BURLEIGH ROCK DRILL CO.,
FITCHBURG, MASS.

The National M. Co. have elected as Trustees: J. B. Haggin, (President), B. B. Minor (Secretary), J. Dolbeer, W. J. Richardson and Julius Ordway (Superintendent).

UTAH ITEMS.—A number of miners are leaving Salt Lake for Montana, in consequence of the reported discoveries of rich mines near Granite rock and Dugway District. Expeditions are heing organized to hunt for diamonds in Arizona. Receipts of ore from Little Cottonwood have greatly diminished. No ore is coming to Salt Lake from the Emma mine, owing to the cave. Memhers of the Imperial Society of Mineralogy and the Imperial Geographical Society of Russia, under the auspices of the Russian Government, arrived in Salt Lake City on the 12th inat, to examine the mineral reaourcea of the country. Mining operations and business generally are unusually dull, the new discoveries in the desert and the Parley's Park mines abaorbing the particular attention of capitalists.

San Francisco Metal Market.

PRICES FOR INVOICES.

Machinery.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

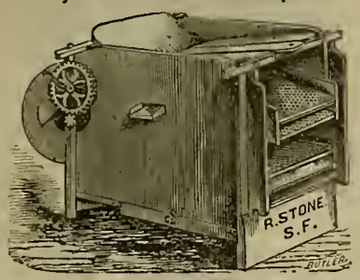
This Amalgamator Opsratss as Follows.

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphory into the quicksilver. The cnrved plates again draw it to the center, whore it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, nntil the ore is reduced to an impalpahle powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, thet the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pens and setlers for themselves, at the office, 229 Fremont Street, San Francisco.

THE PATENT Novelty Mill and Grain Separator



one of the greatest improvements of the age for cleaning and separating Grain, while it combines all the essential qualities of a first-class Fanning Mill. It also far excels anything that has been invented for the separation of Grain. It has been thoroughly tested on all the different kinds of mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.

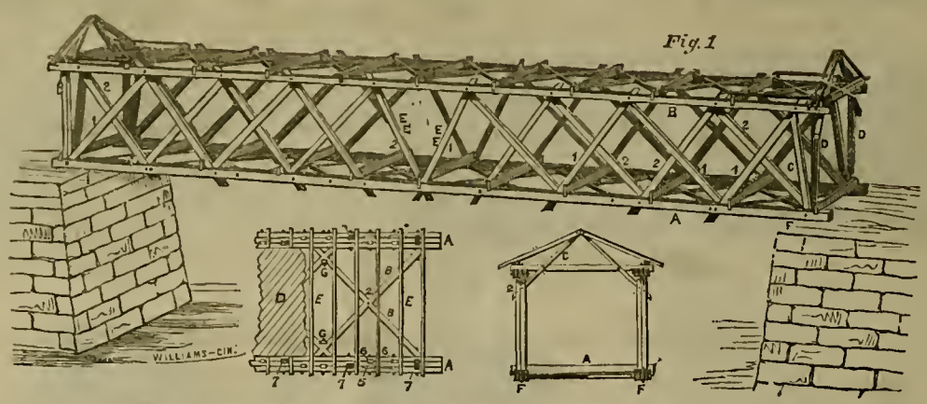
PACIFIC BRIDGE COMPANY,



WORKS NEAR SOUTH POINT MILL, BERRY STREET, SAN FRANCISCO, CAL.

Are Prepared, with Superior Machinery, to Manufacture and Build all kinds of Bridges on Smith's, Howe's, and other Improved Plans. Framing of all kinds done by Machinery.

The Smith Bridges have been thoroughly tested in the East for Three Years, and wherever tried have proved superior to any other Bridge in the following points:

Being built of wood entirely, they are not affected by change of temperature.

The timber used is placed so directly in the line of strain, that less material is required to support the same load.

It is not perceptibly affected by shrinkage. It is the most Economical Bridge built. It is adapted to any practicable Length of Span.

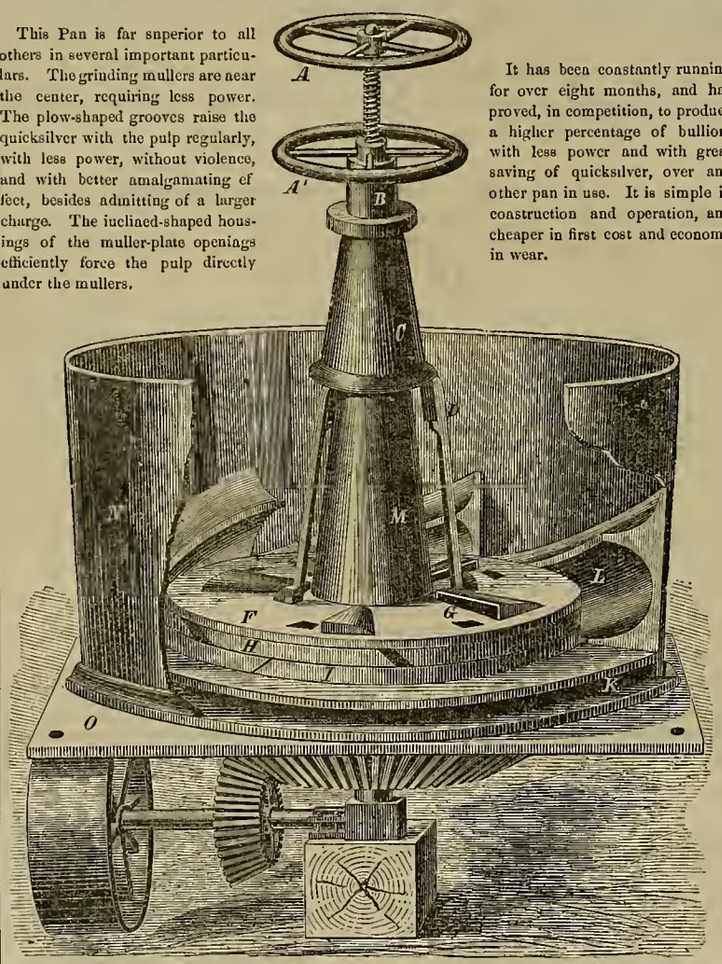
Plans, Specifications and Terms will be sent to any County, Township or Person wishing to build a Bridge, and no charge made unless the Plan is used. For all Public Bridges the Plan will always be open to competition.

Smith's celebrated CAST IRON PIER, economical, and adapted to heavy currents, built at low rates.

C. H. GORRILL, Secretary. **W. H. GORRILL, President.**

STEVENSON'S PATENT MOULD BOARD AMALGAMATING PAN.

This Pan is far superior to all others in several important particulars. The grinding mullers are near the center, requiring less power. The plow-shaped grooves raise the quicksilver with the pulp regularly, with less power, without violence, and with better amalgamating effect, besides admitting of a larger charge. The inclined-shaped housings of the muller-plate openings efficiently force the pulp directly under the mullers.



It has been constantly running for over eight months, and has proved, in competition, to produce a higher percentage of bullion, with less power and with great saving of quicksilver, over any other pan in use. It is simple in construction and operation, and cheaper in first cost and economy in wear.

Manufactursd at the Golden State Iron Works (Co-operative). 19 First street, S. F.

Where it can he examined and further particulars he learned; or persons may apply to the inventor and patentee, Mr. O. C. STEVENSON, at the Douglas Mine, Gold Hill, State of Nevada, where the Pans have long been in constant operation. 15v20-1mr,1amtf

Notice is hereby given, that the copartnership heretofore existing hetwcen A. J. Severance, Charles W. Randall and J. Gus. Burt, under the firm name of "Severance, Holt & Co.," is this day dissolved by mutual consent. A. J. Severance, having purchased all the interest of his late partners, will continue the business of manufacturing and selling Diamond Drills, as before, under the style of A. J. Severance & Co.

Dated San Francisco, Nov. 24, 1871.
Office, 315 California street. A. J. SEVERANCE,

The California Powder Works

No. 314 CALIFORNIA STREET,

SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING, MINING, And BLASTING

POWDER,

Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.

We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

HERCULES POWDER.

Which combines all the force of other strong explosives now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other pompound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office.

16v20-3m JOHN F. LOHSE, Secretary.

The principal Agency on this side of the continent. Established in 1860. Inventors can rely upon the surety and dispatch of all important and confidential business intrusted in our hands. Long familiarity with Mining, Farming, and all other classes of inventions on this coast, enables us to give the most intelligent advice to PACIFIC COAST INVENTORS of any Agency in the Union, and oftentimes save unnecessary delay and expense. Every branch of the patent soliciting business attended to. All WORTHY INVENTIONS patented by us will be liberally noticed, free, at the most desirable time for the patentee, in both the MINING AND SCIENTIFIC PRESS and the PACIFIC RURAL PRESS.

Send for our 52-page illustrated PATENT CIRCULAR, mailed free on receipt of stamp. Also the U. S. Patent Law of 1870.

PACIFIC RURAL PRESS
BY
DEWEY & Co.
PUBLISHERS SAN FRANCISCO
A FIRST CLASS
Agricultural Home Journal

THE PACIFIC RURAL PRESS is now in its fourth volume. Its columns contain a large amount of origiual information upon the different branches of husbandry on this coast. Its great varisty of contents is properly systemized for the couvenience of the readsr, and ably prepared iu pleasing languags and style. Each number contains somethiug of rars iuterest to every membsr of ths household.

The state of this new field of agriculture, so different from all others; the new and improved methods of farming uecsssary here; and the absence of any published record of farming and rural experience on this coast, form a combination of circumstances which render a really good journal of greater importance to farmers here than ars similar issues to farmers in any other part of the world.

The PACIFIC RURAL PRESS has besn heartily received and well patronized, and its liberal success euables us to improve and enrich its columns from month to month.

Its reading and advertising mattsr is entirely chaste. All farmers should subscribe without dslay. Every household should snjoy its richly filled pages.

Subscription, in advancs, $4 a ysar. Single copies 10 cts. Four single copiss, of late dates, sent postpaid for 25 cts. Address

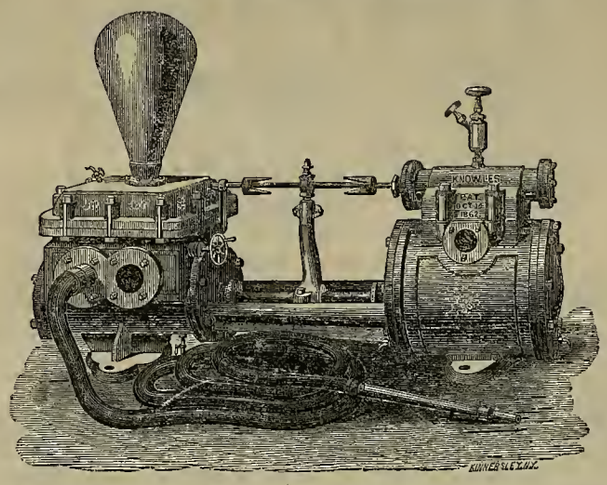
KNOWLES' PATENT STEAM PUMP.

Extract from Official Report of Mechanics' Institute Fair of San Francisco, 1871.

"In the foregoing trials it appears that the most efficient Pump on exhibitlon is the KNOWLES. The workmanship on this Pump is also very good. We would therefore recommend that this Pnmp receive a Silver Medal. (Diploma awarded). Signed by the Committee:

G. W. DICKIE,
CHAS. R. STEIGER, W. EPPELSHEIMER, H. B. ANGELL,
MELVILLE ATWOOD."
v113-awbp



It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequeutly it is always ready to start without using a starting-bar, and does not requirs hand-work to get it past the center. Will always start when the steam cyliuder is filled with cold water of condensation.

The trial of Steam Pumps at the Eighth Industrial Fair in San Francisco, by a Committee of Fivs of the most thoroughly practical mechanics on this coast, showed the Knowles Pump to loss but 11½ per cent., while others lost as high as 40 per cent., showing great difference iu economy.

WE BUILD AND HAVE CONSTANTLY ON HAND

THE LARGEST STOCK OF PUMPS IN THE WORLD,

And for Every Conceivable Purpose.

A. L. FISH, Agent.

No 9 First Street, San Francisco, Cal.

P. S.—All kinds of new and second-hand Machines on hand. 3v24-eow-bp

THE TRUTH!

A. L. FISH, Agent Knowles' Steam Pump—Dear Sir: In answer to your inquiries, we state that the highest award for Steam Pumps at the Eighth or last Mechanics' Fair in San Francisco, was a *First Premium* and Diploma, awarded to the Knowles' Patent Steam Pump, as published in the Official List September 23d, 1871.

A. S. HALLIDIE, President Board of Managers.

The Diamond.—No. 3.

The Diamond Fields of South Africa.

The recent discovery of diamonds in Arizona very naturally leads to a desire for information with regard to other diamond fields, and in response to snch desire we append a brief sketch of the late discoveriea in this direction in Southern Africa.

The First Discovery of African Diamonds.

The region of the African diamond fields has for many years heen occupied hy several small colonies of agriculturists, who were entirely ignorant of the existence of precious stoues on or near their settlements, until some time in the early part of 1867, wheu an Euglish trader on the coast obtained from a farmer in the interior a stone, which upon examiuation, proved to be a valuable diamond, worth over $3,000. This discovery naturally led to further researches in the same neighhorhood, which resulted in the discovery of numerous other diamonds, of greater or less value, among which was a very large oue which, since heing cut, has hecome famous among celehrated diamonds and is known as the "Star of South Africa." It was sold in its rough state for $56,000. Discoveries were thus continned, and new and distant diamond placers were rapidly opened np, and it soon became evident that a new and vast aonrce of wealth was ahout to be developed in thia previoualy but little known portion of the world.

The opening np of this new field of enterprise was speedily followed by the influx of persons, not only from other and less favored portions of South Africa, but from almost all other qnarters of the globe. Nothing like it qad ever before heen witnessed except the rush to California, in the early days of the gold excitement here.

In September 1870, the nnmher of diamond seekers, independent of the native population, was estimated at ahout 5,000 persona. Within leaa than one year from that date that number had increased, by eatimate, to ahout 30,000—uot including aome 4,000 natives.

The Geography of the Diamond-Fields.

Referriug to any ordinary achool atlas, and marking out a section thereon which would be included hetween the 27th and 31st parallela of latitude, and the 95th and 105th degrees of lougitude, the ohserver will have enclosed a parallelogram of about 240 hy 300 milea in extent, which will include all the African diamond fields which have been discovered to date. If the map is a full one there will he observed nearly parallel with the eastern and uorthern liuea of this area, a chain of mountains, enclosing, aa in a semi-circle, a series of rivers flowing down from said mountains and forming the head watera of the Orange river, a magnificent stream, one of the largest on the globe, and uavigable for a distance of several hundred miles from ita mouth. The best portion of the diamond field is found along the valley of the Vaal, the principal northern tributary of the main river.

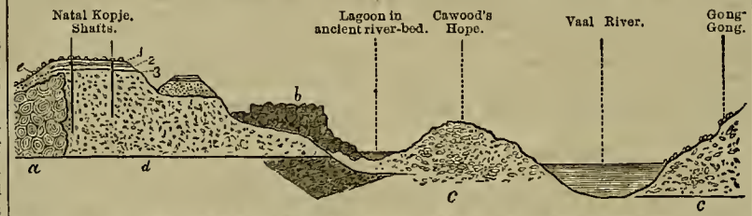
Diamonds have also heen found as far down as the main Orange river, and also on the lower portions of all the trihutaries of the Vaal.

The Geology of the Diamond Region.

On the geological questions with reference to this diamond field, there are various opinions, mainly, however, with regard to the origin of the vast drift deposit, which overlays almost the entire country under consideratiou, and in which the diamonds are found. Some consider thia drift the result of early glacial action or of a water agency—not oceanic, because of the absence of oceanic remains—involving a much larger flow of water than the present configuratiou of the country would admit of. Others think that agencies now at work may have brought down this debris from the mountains to which we have alluded. A careful geological examinatiou of the mountains near the aource of the rivers would prohably very easily decide this question.

In order to give the reader some idea of the geology of the diamond fields, we have appended hereto a sectional diagram of a portion of the field through which the Vaal river flows, and which has been pretty thoroughly explored. The section, as will he seen, extends from Natal Kopje on the oue side of the river to Goug Gong on the other. Both localities have become quite noted for their yield of the precious stoues, and are located iu a central portion of the diamond field. The term "Kopje" is general and applied in that country to a small hill or elevation. This section may be considered a very fair general view of all the country where diamonds are found.

With the exception of the fine straight inclined lines showu hetweeu the letters, *d* and *c*, the eugraving represents an actual representation, as disclosed by shafts, etc., sunk upou the grouud, and has heen copied from an article in the last quarterly issue of the Londou Geological Society. We have added these lines to show, what, from observations in other localities is supposed to he the general character of the rock forming the floor of this great valley. It is often found cropping out on the banks of the river, and in a uumber of places extends quite across the Vaal, forming rapids in the stream. The rock consists of a metamorphous (carhoniferoua?) ahale, inclined at a very small angle. The other geological characteristica in the aection ahown are fully described in the explanation of the aection given in immediate connection with the diagram, and should he carefully studied hy the reader, in order to fully understand what foltowa.



SECTION OF THE DIMANTIFEROUS DEPOSITS FROM NATAL KOPJE TO GONG-GONG, SOUTH AFRICA.

1. Dark Blue, slate-colored, gravelly clay, with boulders.
2. Yellowish clay, with patches of calcareous tufa.
3. Bright red gravelly clay.
a. "Rotten-stone." [Decomposed felspathic smygdaloid?—T. R. J.]
b. Metamorphic (?) rocks, covered with immense boulders.
c. Red, unstratified, clayey gravel, with many houlders, and containing numerous worn fragments of fossil wood
d. Unstratified gravel, containing "kidney-stones."
e. Gravel, ahout 2 feet; no diamonds found.

The couutry for aome distance from the river, and wherever the diamonds are found, ia covered with the gravelly debria shown at *d* and c, and varying hut little in their general characteristics. A most noticeable peculiarity of the valley is its show of numerous small conical elevations, with flat, table-like aummits. Near the river these elevationa are from 20 to 30 feet ahove the general surface, increasing in hight, until at the distance of a few miles they reach aometimes to one or more hundred of feet in elevation. The general contour of these hills (Kopje'a) may be inferred from Natal Kopje, into which two exploring shafta have heeu sunk to 25 and 30 feet in depth. Another similar mound ia aeen near by, at a little diatance heyond. The cause of the flat aurfaces of these mounds is explained by the different stratas of gravelly clay, as shown at Figs. 1, 2 and 3. The aidea of these mounds sometimea slope off iuto small tabular aurfaces, aa shown just to the right of Natal Kopje, and over the letter *d*. These "tables" are sometimes crowued with the clay atratificationa already deacribed, but in this instance they are wantiug.

These mounda are sometimes composed entirely of the gravel, *d* and *c*; at other times the "rotten stone," *a*, reaches almost to the surface. In such cases the little indentationa upon its aurface afford convenient nestling places or "pockets" for the diamonds.

Where the Diamonds are Found.

In the intervening spaces between the mounds, very singular depressions are often found, called "Braak Pans" in colonial phraseology—probably from the salt or hrackish water which accumulate in them during the rainy seasons, aud which passes off only hy evaporation. Some of these "pans" are a mile in exteut.

Du Toit's pan, one of the most famous diamoud deposits is over two miles in extent. Diamonds are sought for in these "pans," and on the flat summits aud benches which surround them. They are seldom found on the slopes leading into them, for evident reasons.

The largest diamonds found up to the present time, according to a paper before us, and which was recently read before the London Geographical Society—as communicated hy Geo. W. Stow, Esq., of Queenstown, Cape Colouy, have been taken from strata similar to that shown at figs. 1, 2 and 3, and which also, as a general thing forms the floor of the pans. They are seldom found in the unstratified gravel and houlder drift which underlies the strata. Very few have heen fouud at a greater depth thsn five or six feet, and by far the largest portion has been taken out within two fect of the surface. All the diamond-producing gravels coutain large quantities of water-worn fossilized wood.

Diamonds in the Rivers.

There is often a terrace-like ridge along the river banks, in which diamonds are found, aud which finally slopes gradually down to the water, hut no diamouds are found on the "slope." We have seen no statement aa to whether the rivera have as yet heen prospected, hut infer that they have not, and that any operations like "turning the rivers," as for gold mining, would require a large outlay. But we read in the paper before us that there are evidences that the Vaal, which is a very crooked river, has frequently changed its bed, and that its former beds, which are distinctly marked hy linea of trees along such depresaions, have been found very prolific in diamonds.

One of the old river beds is shown in our engraving, and which has not yet been filled up by the wash from the adjacent hanka, so as to exclude the water. The small elevation hetween that and the main river, called Cawood's Hope proved a fallacious "hope," indeed, for no diamonds were found in it. It is described as quite a recent river deposit, without the usual clay capping and diamond-bearing drift, which usually accompanies the "Kopjes." It is stated that no shafta have heen sunk in the gravel deposits, *d* and *c*, either at the locality showu or any similar locality to a depth exceeding some 30 feet, probahly for the reason that the influx of water permitting such a loose gravelly deposit rendera snch a work impossible without a drain tunnel, which may he impracticable. Hence nothing is known of what might be found on the "bed rock," except where it rises above the general water level of the country. In auch localities diamonds are almost invariably found. There is probahly much yet to be done iu the way of heavy mining operations in the African diamond fields.

When we go back some distance from the river courses toward the dividing ridgea, the aurface presents quite a different appearance from that near the river. Inatead of being a ferruginous loam it ia decidedly calcareous, while the pebbles are less water-worn and fewer in number.

Diamontiferous Indications.

To the prospector for diamonds, the diamontiferons iudications are of the highest importance. Dr. John Shaw states, in a communication to the Londou Geological Society, that the garnet and tourmaline are invariably associated with the diamond iu South Africa. The diamond appears also to be accompanied by a peculiar substance, called "semmels" from its resemblsnce to brau. It is of a greenish color and looks something like burned brick when impregnated with iron. It consists of a fine clayey detritus, glistcuing with talc, and ahounding with garnets, tourmaline and corundam.

Many think it is derived from the breaking down of the fundamentsl rock, shown betweeu *d* and *e*, and which by such ia called a kind of greenstone—and that that rock, which is supposed to correspond to that which forms the neighboring mountaiu ranges, is the true matrix of the Africau diamond. No scientific examinations have, as yet, heen made to determiue the identity, or otherwise, of the two.

This theory hss been put forth hy Mr. John Peterson, who claims that it is founded ou a minute aud careful examination of the appearances which presented themselves to him on a visit to the diamond fields. He discredits the theories which would refer the presence of diamonds to any distant sources, thinks the evidence incontestable that the "marl soil," as he calls the diamoud drift which we have described, and in which the gems are now found, is the matrix soil of the diamond. This marl soil, he considera to be the metamorphosed shalea (itacolumite?) of the country, and the change which has worked upon these shales, by which they have heen transformed from the hlack carhoniferous shale into the whitish ashy marl in which the diamonds are found, he attributea to intrusiona of greenstone trap, which traverses from N. E. to S. W. in continually recurring dykes.

Mr. Peterson gives some very interesting detaila of the extent and richness of the diamond diggings in South Africa, and in his picture of the Gong-Gong and Belport Diggings at "Great Rushes," in diggera' phraae, resembling in extent and richness Colesberg Kopje, hnt now nearly worked out, not by the hand of man in a few yeara, hut hy the angry waters of the Vaal river through many ages. He found mnch ground-work of hope that the diamond discoveries of Sonth Africa are to be no fleeting, passing industry, but a continuous employment, not only for many years, hut for many ages.

Personal.—Hon. R. W. Raymond, United Statea Commissioner of Mining Statistics, is now in Salt Lake City and will probably be iu San Francisco shortly. Mr. Raymond is now making hia annual tour of inspection in the miniug States and Territories. He will visit Pioche, White Pine, Schell Creek, Reese River, Eureka District and Virginia City and will arrive in this city about the 15th, proximo.

Mr. J. Livingstone Stone is now in thia city for the purpose of obtaining salmon roe for the rivers of the Atlantic Coast. He comea from the United States Commissionera of Fish and Fisheries and takes great interest in the science of breeding fish.

Col. Thomaa Scott, the "railroad king," and Col. J. W. Forney, of the Philadelphia *Press*, are both in this city.

International Patent System.—Prominent English gentlemen who know the need of a change, are atill pushing this matter. A deputation recently waited on Earl Granville to urge npon him the importance of allowing patents only to actual iuventors or their repreaentatives, and of taking steps to aasimilate the patent laws of all conntriea, in order to remove the obstructions under which inventors labor at present. He has taken the matter under advisement.

Microscopical observation haa determined the brown apots upon the peach this year, to be a fungus vegetable growth, the result of some peculiar atmospherical condition.

CORRESPONDENCE.

Notes of Travel in White Pine Co., Nevada—Concluded.

[By our Traveling Correspondent.]

EDS. PRESS:—In my letter from Hamilton, I neglected to mention the fine smelting works of Messrs. Everts & Co., merchants at that place. Theso works are now lying idle, but will soon start up again on ore from the Oro, Eliza D., Caroline and West Point mines, belonging to the same parties, and located about six or seven miles southwest of Hamilton. This smelting furnace is built of stone, and is 30x180 feet square, engine and blower complete; they have also refining works nearly completed, adjoining the same.

Caroline Mine.

This mine is located at Mount Ophir, in Monte Christo District, fifteen miles west of Hamilton. It is owned and superintended by L. Elles, and is being worked through a tunnel, now in 400 feet on a ledge that is quite narrow, but very rich. This ore is said to mill $500 per ton. It is hauled to Reno for reduction, a distance of 400 miles. Mr. Elles is working regularly six men, and his mine is not for sale.

Piermont District—Piermont M. & M. Co.

This property is located about thirty miles south of Schellburn, and ten miles east of Duck Creek (a station on the route between Schellburn and Hamilton). This company is an incorporation of $3,000,000 capital stock, with 30,000 shares; J. E. Perkins is Pres. and J. W. Clark, Sec.; E. B. Dickinson, Supt.; office 418 Cal. St., S. F. This company own two ledges, one 1,200 and the other 1,500 feet in length; their developments consist of five shafts, varying from 75 to 150 feet deep, and two tunnels, one in 200 feet and the other 300 feet. The former is on the ledge and the latter is running to it. The ledge averages about seven feet, running from five to ten feet on a true fissure vein of free milling ore (silver) carrying a trace of gold. Working thirty men on their mine, taking out twenty tons daily, which averages from $40 to $50 per ton. This company also own a ten-stamp mill, run by steam power (with additional power for twenty stamps); the mill is situated in close proximity to the mine, running the ore from the tunnel by truck to the mill; running the mill night and day on their own ore, crushing twenty tons daily, and working ten men regularly at mill. This mill has been in operation since May, 1871; is now a paying institution, and considered a dividend paying mine from this on.

Robinson District.

Mineral City, White Pine Co. Nevada, is located midway between Schellburn, and Hamilton; or about 45 miles from either place, reached by stage from Hamilton or Schellburn, in 6 hours; fare $5. This place contains about 100 inhabitants, and is situated in Robinson Valley, which is about 1½ miles in length, and from 20 to 60 rods in width, watered by two very fine flowing springs, and the hills on each side furnish them with plenty of wood. It is in and upon these hills that the mineral is found in this celebrated district, which are carbonates or base ores, carrying gold, silver, and lead. The principal company here, the only one in fact that is reducing ores, is

Ths Canton Mining Co.

This is an incorporation of $150,000 capital stock, in 1,500 shares, incorporated at Canton, Ohio. G. M. Ogdon Superintendent and resident manager. This company own 41 different sites or ledges, and a fine large furnace and smelting works, located ¼ mile east of Mineral City. The smelting works are run by steam; they have but one furnace; its reducing capacity oree is, 25 to 30 tons per day. It is not running at present but undergoing repairs. The last run on thie Company'e ores yielded about $500 in gold and $175 in silver to the ton of base bullion, the balance lead; from 7 to 10 tons of the rock in this district gives one tou of bullion. This Company are employing in coal-burning, mining and emelting, about 60 men regularly. The titles to all this company's claims have been completed, and U. S. Patents, for the same has been applied for. In the course of another 30 days, at least 100 men will be employed. Among the prominent property owners here are Mr. Samuel Brannan of Napa Co. Cal., and Mr. G. W. Lamb, resident here; they own

The Town Site

and 360 acres of fine valley land just below, including a fine stream of water, known as Murray Creek; also 360 acres of fine timber land, and some 25 mines or ledges. The principal oues that they have developed to any extent are the Calistoga, Manhattan, Silver Star, National, Bowden, Silver Bar, Hidden Treasure, and Badlam. At present only 8 men are employed, but very shortly a large force will be put upon the above mentioned claims. Assays from the latter mentioned mines run from $60 to $100 per ton, in gold and silver.

Copper Miaes.

Some very important copper mines, or locations are located about 5 miles west of Mineral city. The ores are of the red oxide and carbonate order; the principal mines are known as the Osborn and Mineral city No. 1, and No. 2. They assay from 30 to 80 per cent in copper; the best ores of which also contain about $45 per ton in silver. Another feature of the locality is a

Garnet Mine,

located about 1½ miles north of this place. These garnets are found in a belt of volcanic porphyry. They are fonnd in large quantities, from the size of a pin's head to an inch in diameter, numbers of which are not only perfect but very fine. One company shipped over 6,000 of these precious stones to France last year. The Hilp Bros., merchants, are interested in one of the principal locations.

Othsr Claims.

There are some fifty other locations in this District, a large majority of which have been developed sufficient to prove their value. Among which are the Leinhain and May Flower, situated on Union Hill, about one mile west of the town, and owned by Bennefice, Leinhain, Jones & Co. Developments on the former, expose the ledge for a distance of 40 feet, showing a defined ledge 5 feet, thick, running N. E. by S. W., assaying from $60 to $130 in gold, and from $50 to $803 in silver, and about 15 per cent. lead. The May Flowers shows an 8-foot ledge, crops out for about 250 feet, and assays $250 per ton in gold and silver. One-half mile further west is located the Morning Star, belonging to Bennefice & Leinhain. It is exposed so as to show a ledge 40 feet wide, crops out the entire length of the claim, and is traceable for three miles beyond; assays from $60 to $300 per ton in silver. Another quite important claim, and pretty well developed, is the

Mattie Mins

Owned by Bennefice Hendricks & Watson; it is located adjoining the town on the north; they have about 60 tons of ore on the dumps—assaying from $62 to $250 in gold and silver, and about 34 per cent. lead. The parties owning a majority of the locations in this district are poor men, and for their benefit a mill and two or three smelting furnaces additional are needed, and it wonld, in my opinion, be a good investment to parties having the capital.

On the same ledge as the Mattie is the Bullion, owned by the same parties; they have about 15 tons of $130 ore on the dump, working 10 men regularly on the Mattie and Bullion mines; G. S. Hendricks, Supt. Still another important location is the

Hayes Mins

Which is developed to a depth of 80 feet. It is located about two miles west of Mineral City, and is owned by Messrs. Bell, Ludlum & Freeborn. At present it is bonded to other parties and is considered a valuable property; it pays in gold and silver, from $140 to $700 per ton, and carries about 15 per cent. lead. From Pioche, Ely District, in my next. L. P. MC.

Cherry Creek Mines—Montana.

EDITORS PRESS:—It has been about twelve years since I left the extensive gold fields of California, and have since been working and prospecting in nearly all the mining camps of Montana. I have, by aseistance of M. M. Young, my associate, discovered what I consider to be a new El Dorado, on Cherry creek, one of the tributariee of the Madison river. I notice in your issue of the 20th ultimo, that we are said to have solid silver mines, but that ie a mistake of your correspondent; but our surface indications are second to none in California or Nevada. We discovered the

Havana Lode,

The first ledge in the district, about the 20th of May, 1872. Being acquainted with the nature of silver rock, having been engaged as amalgamator in several mills, and having had practical knowledge of ores, I must say, that I never saw rock so rich in silver, and lodes that can be traced as far as these in the vicinity of Cherry creek.

The Ensleman mine, discovered by Henry Ensleman, at a depth of 12 feet, shows a vein of about 40 inches, and can be easily traced for 3,000 feet on the surface, showing native silver, horn silver and the different kinds of chlorides to a greater extent than any ore I ever saw. The extension shows equally as good as the original discovery. Prospectors are commencing to move rapidly through the mountains in the vicinity of the mines, and men with capital are anxiously waiting for the development of the mines. L. P. Sargey, an enterprising business man of Montana has purchased one-half interest in the extension of the Ensleman mine, and is rapidly sinking a shaft under the supervision of George Hurst for the development of the mine. G. W. Rea, Bro. and Bowen purchased 200 feet from Young, on the Ensleman extension. F. R. Merk has purchased 250 feet, undeveloped as it is, for $3,500, from Henry Ensleman, and is running a tunnel in the side of the mountain on the ledge 50 feet. Ensleman also is driving a tunnel in on the ledge following the vein.

Rea, Bro. and Bowen have purchased 200 feet on the Havana lode from Young. The Eberhardt mine, junior in age, but not in richness, about 200 feet down the monntain from the Ensleman, running parallel with it, shows both native silver, horn silver and chlorides; it is a mine of vast richness. The Eberhardt has a vein abont 3 feet wide. Rea, Bro. and Bowen purchased 200 feet on the extension of the Eberhardt, F. R. Merk 200 feet, Wm. Reese 200 feet, John Manihen 200 feet, Rea Bros. also purchased 200 feet on the discovery of the Eberhardt.

Other Mines.

The Wm. Davis lode, discovered by Davis & Rea, showing a vein of abont 4 feet, is a rich mine, showing native silver, black sulphurets and chloride. Jed Daniels is sinking a shaft on the Davis lode for feet. The G. W. Rea lode discovered by Davis and Rea, is a good ledge. Daniels is sinking on the same for feet. The Clagget lode is a valuable one; it was discovered by Goodwin and Hapgood. The Ætna, discovered by Searborough and Reel, is a valuable ledge, and I think it will prove to be the same as the Ensleman. The Mewhaver owned by Wm. Aubery and Bradley, shows rich ore, and will prove a good ledge. The Humboldt ledge has a vein of about 3 feet, showing good quartz that will run about one half silver and gold.

The Wm. Davis lode has four extensions that shows good ore—the Mary, Maud Rea, Silver Crown, Anna A. White and the Monitor. There are about 100 locations in the district that show mineral. M. P. Davis, Houser & Co., have located a tunnel, which they intend driving 3,000 feet into the mountain. They have also established a trading post in the new camp. Rea and Harper, have also located a water right to the water from Cherry creek for milling purposes. They will proseoute their ditch as fast as practicable. There are several rich locations made on the opposite side of the Madison river, about six miles distant from Cherry creek. Charles Dorr and Baldwin have a rich ledge, the Silver Shower; also Terry Payne & Co., have a valuable ledge the "Stonewall." D. M. Johnes and Ghelenberger have an extension on the same.

The mines are situated in low rolling mountains, one of the finest grazing connties in Montana, plenty of wood and water accessible. These mines are bnt in their infancy but they are rich, as far as developed. H. E.

RAPID MANUFACTURE OF VINEGAR.—The *Artisan* describee a new process lately invented by R. D. Turner, of New York city. In this process the agent employed in acetification is ozone, the active element of oxygen or allotropic oxygen, which is eliminated from atmospheric air in the required quantities, and applied directly to the material to be treated. This material is snbjected to conditions, by a system of spraying and re-spraying, in which each infinitesimal atom is surrondded and embraced by the ozone, while at the same time the temperature is kept to the point most favorable to the chemical results to be produced. The effects of ozone are instantaneous. It not only sours, bnt purifies and clarifies at the same time. In all previously known processes for making vinegar there is a large percentage of waste, from loss of quantity and proof by evaporation. This loss is claimed to be entirely prevented in this new process, and this saving alone is estimated by the inventor to be sufficient to cover the expenses of working the machine.

The Production of Gold.

Gold, the most valuable of all metals, is used by all nations as a standard of valne. Besides entering largely into tbe arts, it forms tbe coin most generally in use in Europe and the United States, and is an article of production and export from the latter country. Gold is preferable to silver for coin, as the expense of coining a given sum is only ahout one-tenth tbat of silver, while it is much more conveniently carried; aud in large sums it is more easily and rapidly paid out. It is exported in hars and in coin.

A great impetus was given to commerce about the middle of the present century, by the astonishiug increase in tbe production of gold whicb took place at tbat period. The immediate effect was an advance in the prices of certain necessary articlee required in the then remote mining regions of California and Australia, and in a demand for vessels to transport these articles, together with tbousands of adventurous miners and traders, to the mining districts. Tbe next effect was to disturb the relative values of prodncte; gold heing tbe standard of value. Tbis gave higber prices; stimulated production, and increaeed production demanded of commerce new markets for exchanges, and new and large facilities for effecting them. This demand npon American commerce was promptly met. It immediately established steam communication betweeu New York and New Grenada; founded a new city on the coast of tbe latter country for tbe accommodation of general commerce; built a railroad acrose the Isthmus of Darien; organized steamers on the Pacific to connect New York with San Francisco; constructed a telegraph across or under the Atlantic ocean; made and equipped a railroad over and tbrough tbe bitberto comparatively impaseable Rocky Mountains; and finally eetabliehed direct steam communication between our owu country and Japan, China, and tbe East Indies; all theee wonderful acbievements baving beeu accomplished within the space of about twenty years after the uew discoveries of gold.

The continued production of gold from the sources alluded to, as well ae from other parte of the world, would seem to preclude the poseibility of a return to tbe general scale of prices whicb existed prior to the year 1850.

The annual production of gold throughout tbe world is now pretty uniform; the amount varying in each country more or less each year, but in the aggregate is probably uot far from $200,000,000; some estimates are below and otbers above that amount. Iu a report made to Congress recently, it was put down at $150,000,000; furnished by different countriee as follows:

United States	$60,000,000
Mexico and South America	5,000,000
Australia	60,000,000
British America	5,000,000
Siberia	15,000,000
Elsewhere	5,000,000
Total	$150,000,000

A PHENOMENON IN OIL REGIONS.—The Titusville *Courier* recently published the following interesting particulars of the Newton well on the Nelson Farm, six miles north of that city: It has been down about twenty days—has continuously poured forth such a volume of gas that it was found impossible to pump it, as the valves would not work. The tuding was pulled Wednesday and the well was cased in order to let the gas blow off, so that it might be pumped. After the casing was put in, the sand pump was lowered for the purpose of agitating the well, and the gas raised a column of water, throwing a solid stream into the air a hundred feet. The noise was terrific, and could be heard for a distance of more than two miles. The noise was something like the loud roar of thunder, and when the column burst at the top it threw the water each way for fifteen rods from the well. The water was exhausted in about twenty-five minutes, and then a column of gas followed, rising with tremendous force fifty feet above the derrick. The outpouring of the gas makes a roaring noise that can be distinctly heard for two miles from the well. The noise around sounds like the rushing of the whirlwind. The colnmn can be seen a mile from the well. No tools can be put into the well. As soon as the attempt is made, with euch force does the gas come out that the tools are carried into the air. From description of eye-witnesses this is probably the greatest gas well ever struck in the oil region. Up to last evening the gas showed no signs of being exhausted. The people in the vicinity were very much alarmed, and the cattle run about the fields perfecly wild with fright.

MECHANICAL PROGRESS.

Something New in Pile Driving—Shooting the Piles into the Ground.

F. C. Prindle, Civil Engineer, has made a report of the marvelous success of the new method of shooting piles into the ground with cannon now in use in the Government construction of the new landing wharf on League Island, in the Deleware. More than 800 heavy yellow pine piles, averaging ten inches middle diameter, have now been driven through mud and clay to a very hard bottom, twenty-one feet below mean low water. The machine is secured to a large scow, in the usual manner, assisted by a small engine to hoist the piles into position.

The gun, weighing 1,800 lbs., has 6¼ inch bore, 24 inches deep, pointing upwards, and is recessed at the lower end to receive the head of the pile, upon which it rests.

The ram, weighing, 1,300 lbs., moves in the same guides as the gun, and is provided with a piston, projecting from its lower end, and neatly fitting into the bore of the gun, its upper end having a bore of greater diameter, to receive a fixed piston secured to the top of the frame, and thus form an air cushion to prevent its escape from the guides when the light of its rebound is limited, as during the first blow with very long piles. The ram is caught and held at its highest ascent, and also released for the succeeding blow by the operation of a friction brake at one side pressing it against the opposite guide—all at the will of the operator on deck.

The operation of driving is as follows: The engine hoists the ram, gun, and pile into position simultaneously, with one movement; the brake is then applied, holding the ram in place uppermost, and the gun and pile are then lowered together until the pile rests in the mud; the gun is then lowered on the top of the pile, the recess securely holding the pile-head in place directly underneath.

A cartridge is then dropped in the gun, the operator releases the brake, and the ram falls with its piston entering the bore of the gun (which is made slightly funnel-shaped at the muzzle), and by compressing the air exerts a gradually increasing downward presenre upon gun and pile, till the inertia of both is more or less entirely overcome, the cartridge is crushed by the piston, and ignited by the heat evolved by the sudden and severe compression of the confined air. An explosion immediately ensues, the result of which is to violently force the pile downward, and this ie measured by the reactionary effort upon the ram—the light to which it is thus thrown, and from a state of rest, practically. The force due to the fall of the ram, and the explosive force exerted to throw it up and again in position, are thus at once combined and applied to the pile.

The principal difference of effect between this method and the ordinary hammer, appears to be just here: in the one case the pile is already in motion when a tremendous force is suddenly brought to bear upon it in the same direction, and in the other case it receives a violent blow when at rest, and a considerable portion of the force is expended uselessly in the destruction of the pile-head itself, before its enertia is overcome and motion produced. Hence the necessity of strongly banding the pile-heads in the latter case, and the utter absence of any necessity for their protection in the former.

The ram, on its rebound, is caught and held by the brake, and the operation repeated at pleasure. On January 13th, twelve piles were driven in a single hour. The piles were all driven without the slightest injury, and none of them showed any marks of violence.—*American Builder.*

PRECISION IN STONE CUTTING.—It is a curious fact, that the six hundred men who are employed in cutting granite at Dix Island, Maine, for the New York Post-Office, cannot prepare material fast enough for the two men who are employed to set the blocks. Each block of granite is cut, trimmed, faced, and accurately numbered according to the working plans. When it arrives at the site of the building, only two men are required to set it, aided as they are by steam hoisting-apparatus. Every stone is made to fit exactly in the space intended for it. So accurate are the plans of the supervising architect, that it is stated that the superintendent of the Post-Office building has only been obliged to order one stone during the entire work thus far, and the foreman at Dix Island insists that the missing one was sent, but lost in transportation.

SCREWS VS. NAILS.—Most mechanics who work in wood do not appear to understand the eminent superiority of wood screws over brads and nails. In many places, one screw is worth three or four nails. When one is securing cleats to batten doors, or cleats to a wagon box, nails are very unsuitable when compared with the efficiency of gimlet-pointed screws. Screws will hold two pieces of wood more rigidly than nails; and, if the timber should shrink a trifle, the screws can be turned up tight; whereas it is difficult, in most instances, to tighten up loose work with nails in all places where there is an unusual strain on the parts to be held together.

Mechanical Architecture.

The idea is gaining ground that an architect should aspire to be also an artist—that he should confine himself less closely to his box of instruments—his square and dividers—and draw with a free hand, like an artist. Architecture has its constructive and its decorative aspect, and the architect should be artist enough to combine both.

"There is, perhaps," says the London *Architect*, "no quality more conspicuous by its absence than this [artistic design] in the actual practice of what we agree to call the architectural profession. The regulation 'office' education of an architectural student has become so far removed as possible from 'studio' work, and this fact is significantly illustrated by the habit, confirmed and accepted, which even our leading architects cultivate when they speak and write of their assistants and pupils as 'clerks.'

At no time in the history of the art has either of these junior members been so much regarded as a mere clerical machine for the use of the square and compasses. If he can deftly manipulate his box of instruments, he seems to reach the summit of the professional skill required of him. Granted a little knowledge of the historical styles, with a certain or uncertain amount of ideality in using them, and your complete article is ready to hand in the shape of an architect, as we consent to accept it.

The canvas-painter, however, when he desires to deal with the representation of building designs, is happily ignorant in great part of the compasses and bow-pencil. His instinct is to draw with free hand, and not with any mechanical appliance, the forms which he desires to delineate. He regards and treats a building from general conception down to detail. The office-trained architect, on the contrary, begins with notions of detail and tries to work up the complete result.

It is as idle to blind ourselves to this distinction as to deny the difference of the result. In the one case we have pictures of architectural interest which in skilled hands will charm the eye, while the other gives us but a scholarly elaboration of 'correct' shapes and details, worked out, it may be, with more or less artistic feeling, but which continually remind one that our contemporary practice of architecture smacks more of the *office* than the *studio*.

No great architect ever depended on mechanical instruments of brass or steel for the realization of his conceptions."

A NEW SILVER STEEL—PYRO-SILVER.—The question has more than once been asked, why was not the steel knife banished with the steel fork? We believe the true answer to this to lie in the fact that no one had discovered a silver knife with a cutting blade that would continue sharp and wear as steel does. But the discovery has now been made, and in the pyro-silver of Mr. J. Neal, of 48 Edgeware-road, we have a material which combines the above qualities in an eminent degree. This compound, as applied to knives, consists of a blade of the finest steel as a basis, and which is chemically cleaned by a special process. It is then treated with silver in the purest possible state, and the two together are passed through certain processes known only to the inventor, after which they are treated in combination under atmospheric pressure. By this means the silver is said to to be driven into the pores of the steel, and heat afterwards has no perceptible effect on the metals. The result is a knife which will not rust, is not stained by acids, and only requires washing after use. When blunt it is simply sharpened on a steel in the same way as any other knife to keep an edge, and it does not partake of the flavor of anything it may have to cut. In short, it possesses the combined advantages of both steel and silver, besides others peculiar only to itself, as we have found on a fair trial of the metal.

PROSPECTIVE ABOLITION OF STEAMER FUNNELS.—According to the *Swiss Times*, two Austrian marine officers and a marine engineer have discovered by united experiments a method of conveying away under water the smoke from the steam engine, instead of through a funnel into the air. They make use of double ventilators, which compress the smoke and force it overboard. For propelling these ventilators they employ, according to circumstances, either water power—that is the pressure of the water between the surface of the water and the place where this apparatus is fixed; or, for smaller vessels, steam-power. A chief advantage of this discovery will be the greater security of ships of war, as, in armour-plated ships, the only vulnerable part, the funnel, will be taken away. For submarine and torpedo ships and monitors this discovery, it is said, will be of great value.

MEASURING FURNACE HEAT.—An instrument has been invented in Germany which will measure with perfect accuracy the heat of the hottest furnace. It is based on the principle that the resistance of pure metals to the electric current increases with the temperature in a very simple ratio. A platinum wire of known resistance is coiled around a cylinder of fine clay, and covered with a tube of the same material. The test is a Daniells battery, of two cells, and with a resistance measurer, and placed in the furnace whose temperature is to be ascertained. It is then only necessary to read off the indications of temperature on the graduated resistance measure.

GALVANIZED IRON is coming more and more into use as a building material. Almost every considerable town in the Eastern and Middle States, now has its iron roofs, and what with iron joists, iron girders, iron lath, etc., the American people bid fair to soon rival Europeans in the use of this cheap, substantial and enduring material for building purposes.

SCIENTIFIC PROGRESS.

Gases Occluded in Meteoric Iron.

We take from the *Am. Artisan* the result of the experiments of Prof. J. W. Mallet, of the University of Virginia, on these gases. The piece of meteoric iron experimented with had a volume of 15.87 c. c. and weighed 124,589 grms. It was determined to analyze separately that collected at the beginning, middle and end of the process, in order to see whether the different constituent gases were given off at the same or at different rates. The total amount obtained was 36·33 c. c., and reduced to 0° C., and 1 metre pressure. This was divided into three portions for analysis, as follows:

		H.	M.
A.	52·02 per cent. of the whole was collected in	2	30
B.	24·11 " " "	2	20
C.	23·87 " " "	9	40
	100·00	14	30

It will be seen that the greater part came off within the first two hours and a half; but the process lasted fourteen hours and a half, and was not over at the end even of this time. The heat had been gradually raised from dull redness to something nearly approaching whiteness at the end of the time; and when the experiment was stopped, very small but still perceptible traces of gas were still coming off, though their appearance was immediately arrested whenever the temperature was allowed to fall but a little below the high point which had been reached. The piece of iron taken out from the tube when it had become quite cold was found glazed by a thin film of fused phosphide of iron and nickel (Schreibersite), thickest on the edge which had been lowest, this phosphide having oozed out from the mass at the very high temperature used. The tubes used to collect the gas during the first portion of the time occupied in the experiment were found slightly moistened on the inside, and the moisture, which had a distinctly acid reaction, was proved to contain hydrochloric acid, this having no doubt been derived from the chlorine existing in the iron in combination with that metal and nickel. Careful analysis of the gas yielded the following results by volume for the three portions separately collected; the fourth column of figures, obtained by summing up the three which preceded it, gives the percentage composition of the whole of the gaseous matter extracted from the iron:

	Port'n A.	Port'n B.	Port'n C.	Total gas.
Hydrogen	22·12	10·52	3·19	35·83
Carbonic oxyd	15·99	11·12	11·22	38·33
Carbonic anhydride	7·85	1·02	0·88	9·75
Nitrogen	6·06	1·45	8 58	16·09
	55·02	24·11	23·87	100·00

Other gases were tested for, but none could be found; no free oxygen could be detected, nor any compound of carbon and hydrogen.

A DESIRABLE AND POSSIBLE DISCOVERY.—The greatest difficulty in the way of treating iron from ores by the Bessemer process is the presence of phosphorus in most of the ores. Hence only iron from certain ores, comparatively free from phosphorus, can be practicably subjected to that process. It may be difficult; but it would not excite surprise in the minds of chemists, says an exchange, if a simple and inexpensive process for separating iron and phosphorus were made known at an early day, so that only one of the latter should be found in 5,000 of the former; and now that there is such a margin to stimulate exertion, we may be sure the minds of properly qualified persons will be directed towards the solution of a question of such national importance. That such a thorough elimination of phosphorus *may* be made will readily be conceived when the fact is considered that the Pattinson process does not leave one part of silver in 100,000 parts of lead.

SUDDEN RISE IN LAKE ONTARIO.—On the 13th of June, at 3 P. M., the water in Lakes Ontario and Oswego rose two feet, remaining at that elevation sixty-four minutes. From that time until 7 o'clock the water alternately rose and fell, subsiding to the ordinary level at 7 o'clock, where it remained. Previous to the rise a white squall on the lake gathered a high water-spout, which swept rapidly to the east, a rumbling sound was heard coming from the water, fish came to the surface of the water in great numbers, and bubbles of air rose rapidly and exploded. The symptoms seemed to indicate a submarine earthquake. Many such fluctuations in the level of water in the North American lakes are well authenticated. They have usually been ascribed to winds, and this was probably the cause in the present instance.

ACTION OF OZONE UPON VULCANIZED CAOUTCHOUC.—Prof. A. W. Wright (*Am. Jour. Sci.* for July) finds that the ebonite insulators on the Holtz electro-machine are slowly decomposed by the ozone produced, the issuing sulphur, meanwhile, combining with the oxygen to form sulphurous oxide which with the atmospheric moisture produces sulphurous acid, this in turn being converted into sulphuric acid by the further action of the ozone. The deleterious effect upon the insulators can be remedied by neutralizing the acid with some substance which will not form a hygroscopic compound or essentially lessen the insulating power of the ebonite. Oxide and carbonite of magnesium have been used with good effect. A little of these, in fine powder is rubbed over the insulators with a piece of soft cloth; the excess is removed with a wet cloth and the surface, after drying, cleaned and polished with a soft woolen cloth slightly dampened with carbonic disulphide. The last is used very carefully, as it attacks the ebonite. Should the ebonite be discolored by these operations, the color can be restored by rubbing with a little oil, or it will return of itself after a time.

PHOSPHORUS IN COAL.—On this subject the following discussion, at the late session of the American Institute of Mining Engineers, has interest: "Mr. Coxe thought that new analyses of the anthracites are necessary to determine whether they have phosphorus. Our analyses are all old; and were made by old methods of analysis, and before the questions of the present day had acquired their importance.

"Dr. Hunt.—There is probably no phosphorus in antbracite or bituminous coals, because there is nothing to retain the phosphorus. The white ash coals have had their iron eliminated by solution, and as iron phosphide is very soluble, these coals at least bid fair to be free from this impurity.

"Mr. Britton said that phosphorus had been found in the ashes of Ohio coal."

PROCESS FOR ADVANCING OR RETARDING THE HATCHING OF SILKWORMS.—M. E. Declanx gives the following as the results of his experiments: 1st. To prevent an egg from hatching at the ordinary time, it must be kept from the time of deposit at a temperature between 15° and 20° C., exposed to cold for a fortnight about three months previous to the time at which it is desired to hatch it, and then treated in the ordinary way. 2d. To cause an egg to hatch before the ordinary time, it should be exposed to cold twenty days before deposition, and left so for two months. Six weeks after, it is in the same condition as the normal egg, and may be treated in the same manner.

IRON DEPOSITED BY ELECTRICITY.—The following conclusions have been reached in the course of investigations into the characteristics of iron deposited by electricity. First, iron and copper when deposited absorb a certain amount of gas, especially hydrogen; second, the volume of the gas absorbed by iron varies between widely extended limits—this, in the case of iron, being sometimes as much as 185 times its volume; third, absorption of gas takes place principally in the layers which are deposited first; fourth, when such iron is heated the disengagement of the gas commences below the temperature of 212°. At this temperature it is principally hydrogen that is separated.

A NEW VOLATILE AND SACCHARINE SUBSTANCE FROM CAOUTCHOUC.—Aimé Girard calls attention, in *Comptes Rendus*, to a new substance which has been extracted from the caoutchouc of Borneo, and hence called *Bornesite*. It is obtained in transparent crystals, monoclinic, very soluble in water, less so in alcohol, melting at 175°, subliming with slight decomposition, at 205°. Bornesite is not fermentable, does not reduce the copper-test, and is converted by boiling with sulphuric acid into a sugar which reduces this test. Analysis gives the formula $C_{14}H_{14}O_{12}$.

VELOCITY OF ELECTRIC WAVES.—The velocity of electric waves through the Atlantic cable has been ascertained by Professor Gould to be from 7,000 to 8,000 miles per second. Telegraph wires upon poles in the air conduct the electric waves with a velocity more than double, the rapidity of the transmission increasing with the light. Wires slightly elevated transmit signals with a velocity of 12,000 miles per second, and those at a considerable light give a velocity of 16,000 or 20,000.

NEW PROCESS FOR MOULDING SILICA.—M. Muller, in *Revue Chemie* proposes the following new method for utilizing silica:—The silica is reduced to an impalpable powder, which is mixed with water to form a paste, when it may be moulded. Then on being heated to bright red, it fuses together giving a form of pure silica. Even larger grains may be introduced into the mass as they will be fused on the surfaces and agglomerate with the silicious powder.

POTASH SALTS are essential to the assimilation of plants; without them starch is not formed in the chlorophyll granules, and the weight of the plant remains constant as in pure water.

TEST FOR WOOD FIBRE IN PAPER.—The muriate of naphthylamin is said to be a far more delicate test than sulphate of aniline. Wood fibre is colored bright yellow.

OUR MINING SHAREHOLDERS' DIRECTORY.

S. F. Stock and Exchange Board.

Thursday, August 22, 1872.

The Stock Market generally has been dull this week, and aa will be seen by our table of sales, etc., nearly the whole list shows a decline from highest prices of last week. Tbe operations in the Board this morning amounted almost to a panic, and the decline from yesterday's sales are very marked. Comparing this morniug's prices with the highest paid previously this montb, Alpha shows a decline of $31; Belcher, $17; Chollar Potosi, $37; Caledouia, $26; Cous. Virginia, $22; Confidence, $5; Crown Point, $21; Gould & Curry, $42; Hale & Norcross, $31; Overman, $22; Savage, $83; Segregated Belcher, $50; Yellow Jacket, $21; Sierra Nevada, $5.50; Empire Mill, $8; Imperial, $5.50; Kentuck, $45; and Ophir, $18.

The Market on the 16th inst. was stronger than on the previous day, some descriptions advancing, Caledonia and Overman particularly, tbe latter rising $15. On the 17th prices were generally better, Caledonia advanced $4; Cbollar $2; Crown Point, $3; Overman, $4; Raymond & Ely, $5; Savage, $2; and Hale & Norcross and Yellow Jacket, each, $1. On the 19th prices were regular and market strong. Comstock mines were generally lower in the afternoon board, while the Ely District mines were better snstained. Belcher declined $6; Crown Point, $4; Caledonia, $9; Overman, $7; Chollar, $2; Cons. Virginia, $2.50; Kentuck went up $10; Savage $2; Raymond & Ely advanced $5; Pioche $1.50, and Meadow Valley, $3. On Tuesday, the 20th, the market was weak and prices generally lower excepting Pioche which advanced. Belcher declined $5 from previous days' sales. Caledonia, $5; Gould & Curry, $7; Hale & Norcross, $3; Ophir and Overman, each, $3; Imperial, Eclipse and Empire Mill, each, $1; Savage, $8; Yellow Jacket, $6; Cons. Virginia, $2; Meadow Valley, $4 and Raymond & Ely, $8. On Wednesday stocks were dull again at much lower rates than tbe day previous. Belcher fell from $121 to $118, Crown Point was down to $135, Empire Mill declined $4; Imperial, $3; Eclipse, $4; Yellow Jacket, $4; Overman, 14; Segregated Belcher, $12 and Raymoud & Ely $7. Pioche advanced $3 on the strength of new strikes.

Belcher.—The sum of $24,408.98 was sent down on the 14th inst. aud $28,000 on the 15th. The regular weekly letter shows continued progress. The air in the mine has improved. Nothing is being done below the 1,100-foot level. The usual amount of ore was not hoisted because the Yellow Jacket cages were being used by that company for hoisting water a considerable part of the time.

Crown Point.—Bullion shipped on the 14th inst. $17,521 aud on the 16th, $25,061. The ore production last month was 11,000 tons yielding $35 per tou or $385,000. The amount now being extracted is about 400 tons per day, and is iucreasing since the water ie overcome and the machinery in good order. Work has begun in the thirteenth level.

The ore matter is richer than above and thicker as it descends. The south winze in the thirteenth level, near the Belcher liue, has yielded ore worth from $500 to $5,300 per ton at a depth of 80 feet. The ore body shows signs of indefinite extenaion. The progresa of work in the lowest level is much retarded by heat at present, hut this will be remedied by a connectiou with the east winze. The average ore production last month was 370 tons per day, and last week 400 tons.

Chollar Potosi.—Ore extracted on the 15th, 160 tons. For the week euding Aug. 17th, 1,715 tons were extracted, assaying $34.55 per ton. Bullion shipped on the 17th, $13,446.73.

Raymonn & Ely.—Bullion shipped on the 15th inst. $34,164, and on the 18th $34,625, on the 21st $34,333—making a total thus far for August of $240,502, an average of $11,452.47 per day.

Pioche.—On tbe 16th the ore iu stopea of the first level were two feet wide, assaying $175 per ton; on the 17th ore was two-and-a-half feet wide, assaying $186; on the 20th—the same width but assaying $198: on the 22d it assayed $210. The Bowery mill which is crushing Pioche ore has been changed to a double discharge, and the American Flag mill is also crushing for the Pioche. Hoisting the usual quantity of first class ore.

Savage.—Ore extracted for week ending August 10th, 1,126 tons; ore delivered, 1,171 tons, leaving 100 toua on hand; average assay $22.76.

Imperial.—Work is progressing satisfactorily and the ore in the winze shows signs of increasing in width.

Phœnix.—Ten tons of bullion were shipped, August 14th, assaying $300.75 per ton, total value $3,975. On the 17th, six bars were shipped, assaying $279.55 per ton; total value $2,217.

Sierra Nevada.—For week ending August 17th, 350 were produced.

The clean up of the Eureka (Grass Valley) mine on the 17tb, with 15 stamps was 950 ounces of amalgam. The sum of $1,575.30 was sent down from the Buckeye mine on the 17th. The Ida Elmore mine shipped $4,043.20 on the 13th. The North Star report of tbe 17th gives 188 tons received at furnaces, 158 tons reduced, aud 65 tons on hand. The hoisting works on the American Flag are running finely. Shipmenta from the Piermont up to the 17th inst., amount to $5,777. Bullion shipped from Kentuck on the 14th, 5,286.31 Ore extracted last week from Eureka Cona. 915 tons, reduced 744 tons, ore on dump 1,572 tons. A rich body of ore is reported struck in the Mahogany mine.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE COUNTY.

I. X. L.—Alpine *Chronicle*, Aug. 10: Preparations are being made for sinking a shaft preparatory to the erection of hoisting works.

M. & N. W.—Monitor *Miner*, Aug. 10: The down shaft on the ore-body of Drift. No. 6 started this week, is already down several ft. and shows good ore.

Hoisting Works for 2 claims up Scandinavian Cañon are in process of coustruction.

BUTTE COUNTY.

Golden Summit.—Cor. Oroville *Record*, Aug. 17: The most important mines are those located on theMammoth silver lead. It is a fine, well developed ledge, from 6 to 10 ft. wide. The Golden Summit Company are sinking a shaft and taking out some fine looking ore. The Belmout, the first extension north, are striking ore at the depth of 4 ft. The Dexter, the second extension north, are sinking a shaft and taking out some very fine ore.

CALAVERAS COUNTY.

State of Maine.—Calaveras *Chronicle*, Aug. 17: The ledge varies in width from 2½ to 4 ft., and has every appearance of a true fissure vein. The rock will probably average $15 per ton; 12 men are employed.

Gwin Mine.—Extraordinarily rich rock has been struck in the soutb shaft, below the 500 ft. level. A contract has been made to sink 100 ft. deeper making 600 ft. in all. Work on the central shaft is progressing finely.

Tecumseh.—The main ehaft 150 ft. deep. At 116 ft. a level bas been run 80 ft. on the ledge which is very wide. At the end of the level a prospect sbaft 50 ft. in depth has been sunk, uncovering quartz that pays from $25 to $40 per ton. The Co. are now putting up a 24 horse power engine for hoisting and pumping purposes. As sinking progresses the rock increases in richnese.

Goon Hope.—The owners have out 100 tons of rock and will soon commence crushiug.

Good Rock.—Eighteen toue from the recently discovered mine of Lewis & Fairchild, Moequito Gulch, yielded $700.

Struck.—The lead in the San Bruno has been struck in the lower tunnel, after running 250 ft. The ledge shows splendidly where the drift cuts it, being fully 3 ft. in widtb and composed of first-grade ore.

Clean Up.—San Andreas *Citizen*, Aug. 17: The Whisky Hill Hydraulic Co. have had a splendid clean up—realizing over $5,000.

EL DORADO COUNTY.

Rich.—Placerville *Democrat*, Aug. 17: Very rich ore has been struck in the Grey mine, Gray's Flat. They are putting up a 10 stamp mill. They have out a large amount of rock, 100 tons of which ia eatimated to he worth $100 per ton. Down on the ledge 150 ft.

FRESNO COUNTY.

Prospecting.— Freano *Expositor*, Aug. 14: Quite a quartz fever has aprung up, and considerable prospecting is done.

INYO COUNTY.

Bullion.—Inyo *Independent*, Aug. 10: July 21st. Hiskey & Walter shipped 4 bars, weighing 1,789 ozs. valued at $1,800. Also August 4tb, 5 bars, weighing 1,850 ounces, valued at $1,900.

KERN COUNTY.

St. John Mine.—Havilah *Miner*, Aug. 10: Tbe Bridger Bros. have a well defined 5 ft. lead, and are extracting ore that averages $40 per ton. The new shaft is down over 300 ft. and levels run over 2,000 ft.

Arastras.—Two arastras were put up at Kernville this week.

Bright Star.—The proprietors have their hoisting works in good running order, and are taking out quartz at 200 ft. that pays $100 per ton. The lead is 6 ft. wide.

The 2 stamp mill at Kernville broke down last week.

MARIPOSA COUNTY.

Pine Tree.—Mariposa *Gazette*, Aug. 16: About 75 men, 50 of whom are Chinamen, are at work taking out good ore. A recent clean up, after a run of 30 days, yielded $8,000.

NAPA COUNTY.

Quicksilver.—Napa *Reporter*, Aug. 17: Tbe quicksilver mines in Pope Valley are doing well. At the Wasbington, a new lode has been struck, which is the richest yet discovered. The amall furuace in operation is soon to be replaced by one of a larger and better pattern. Work will be pushed vigorously.

NEVADA COUNTY.

Clean Up. — Nevada *Transcript*, Aug. 16: The Oriental G. Co., Woolsey's Flat, cleaned up this week $6,300. The expense of the run was $2,000.

Gaston Ridge.—Work is being rapidly pushed on the ledges recently discovered. The farther down they go the richer they are.

North Bloomfield.—The North Bloomfield is employing a large number of men. On Wednesday the first of their 8 or 9 hoisting works on the line of their tunnel was started up at shaft number 8.

PLACER COUNTY.

Ophir.—Cor. Placer *Herald*, Aug. 17: The Greene is taking out extraordinary rich ore, in large quantities. The Eclipse has a second shaft down 60 ft. and finds the ledge from 2¼

to 3 ft. thick, and yielding ore that will pay from $20 to $25 per ton. The Good Easter is east of the Eclipse. Shaft 140 ft. deep, and still being sunk. The steam mill Co. is the first eastern extension of the Bellevue or Buckeye. The shaft down 130 ft. with a ledge of 20 inches thick, yielding good ore. The Bellevue is raising good ore. This Co. has 3 shafts and also running a tunnel from Doty's ravine that will tap and drain all these shafts. The Golden Eagle Co. has erected steam hoisting works on the new shaft which is down 50 ft. This shaft is 4 by 8 ft. in the clear. The ore that is coming out will yield over $30 per ton. The St. Patrick Co. is repairing its mill, and will have it in running order in about 10 days. At the mine, they are taking out very rich ore. Fred Jones has begun work on Crater Hill, on the Crater Hill mine. The ledge is 16 inches thick. Judge Spear had some of the rock from near the surface milled which paid $40 per ton. As the shaft goes down the ore becomes richer, and what is being raised will yield from $80 to $100 per ton. Work has commenced on Shipley, and the ore looks well. At the St. Lawrence they are hoisting good milling rock, with plenty in sight.

Salsig.—The owners had 20 tons crushed this week, which yielded over $65 per ton.

PLUMAS COUNTY.

Rich.—Quincy *National*, Aug. 17: A. C. Light has discovered a ledge on the mountain south of Indian Valley, which is reported fabulously rich.

SAN DIEGO COUNTY.

Golden Chariot.—Cor. San Diego *Union*, Aug. 9: Three shafts have been sunk on the ledge; one 35, one 50 and one 110 ft. deep. Work is being prosecuted only in the 50 ft. shaft. In this shaft a level has been run 150 ft. upon the ledge towards the north and stopes have been started.

The ledge averages about 2 ft. in width.

There is on the dump 150 or 200 tons of rock and at the mill 100 tons which is now being crushed.

The Co. is working 20 men.

Second Ex.—Pat. O'Deou has struck it rich on the second ex. of Golden Chariot.

SANTA CRUZ COUNTY.

Rich.—Santa Cruz *Sentinel*, Aug 17: The Santa Cruz and Brancifort Quicksilver Co. have struck very rich rock in their claim. The cinnabar and pure vermillion being visible in masses and crystals, sulphurets and seams all through the rock.

TUOLUMNE COUNTY.

Rich.—Sonora *Independent*, Aug. 17: Mr. Green, in his claim, above the "Old Tuolumne," has found a number of "pocket lodes," from which he has transferred several hundred dollars.

Old Tuolumne Claim.—This Co. have made an open cut and run a tunnel 100 ft. with a view of tapping their lode 60 ft. from the surface. In this operation they struck a sulphate lode 5 feet in thickness which prospects from $50 to $157.50 to the ton. In their shaft 23 ft. down, they have a quartz lode 2 ft. wide, and increasing as it goes deeper.

Nevada.

ELKO COUNTY.

Railroad.—Elko *Independent*, Aug 17: At 35 ft. in the Snowflake very fine ore, composed of galena, silicate of copper and iron was struck.

A new discovery of silicate of copper ore has been struck just east of the Last Chance, in the Sky Blue.

The Webfoot tunnel is being pushed forward with vigor.

Norton is pushing two tunnels on the Shoo Fly.

The shipments of ore from the Ella are 25 tons per week.

EUREKA DISTRICT.

Phenix.—Eureka *Sentinel*, Aug. 16: Phenix smelting works yesterday shut down permanently. A new furnace of 66 tons capacity is to be immediately erected.

Louisville Con.—The property is on Adams Hill, and there are 10 claims included in the consolidation. On each, shafts have been put down from 40 to 100 ft. There is a world of ore in sight, most of which is exceedingly high grade, going on an average of $150 per ton. Seventeen men are engaged day and night in carrying down shafts at 3 different points. In the Louisville shaft proper a fine body of ore was developed last week at a depth of 90 ft.

Geddes and Bertrand.—On the various dumps are 800 tons of first-class ore, and in the Calico alone there is developed, by actual measurement, 10,000 tons of ore, averaging $92 per ton.

ELY DIST.

Bullion.—Ely *Record*, Aug. 11: During the past week W. F. & Co. have shipped bullion valued at $123,072.49.

Alps Shaft.—The Alps shaft is down 175 ft. and still sinking.

Peavine.—Prospecting at three points; sinking shaft near 95 feet deep and expect to cut the ledge with shaft in 20 ft. Running drift with ledge on 80-ft. level; ore vein improving, and running 30-ft. drift into the hill. Last 50 ft. continues on vein, 15 to 20 inches; average assay, $150 per ton—much of it reaching $300.

Ivanhoe.—Prospecting shaft down 225 ft. Have made a cross-cut in the foot wall, and find the vein five ft. in width, a portion being free milling ore. The new shaft is down 110 ft. with the ledge showing 4 ft. in width. Hoisting machinery has been ordered and steam power will be in operation in a short time.

Shut Down.—On Thursday last the Bowery mill, Bullionville was shut down for repairs and alterations, but will start up again to-morrow.

Kentucky Rifleman.—One shaft is down some 35 ft. on the ledge which is widening and improving fast.

Mocking Bird.—Ledge shows fully 4 ft. in width in bottom of shaft, which has attained a depth of over 70 ft.; 2 feet of the ledge is free solid milling ore.

Condor.—South drift in 20 ft. and shows 2½ ft. of good milling ore in face. A new drift, running north, was started from the bottom of the main shaft during the past week, and at present the ledge shows fully 3 feet in width, half of it being free milling ore.

Maggie.—Commenced work yesterday, a contract having been let to sink the shaft.

Stialing.—Commenced drifting across the ledge at the 175 ft. level during the past week, and as far as opened upon the ore continues to widen in ledge.

Chief Dist.—The Black Hawk is working 2 shifts, and is down about 20 ft; taking out fine ore. The Huber shaft is down 50 ft., with a fine body of ore. The Southern Cross is progressing finely.

HUMBOLDT.

Oreana.—Unionville *Silver State*, Aug. 17: 18 tons were shipped this week from the Chloride, which it is thought will work $150 per ton.

W. H. Baker has commenced work on his Clipper mine.

Dun Glen.—A fine body of ore has been cut in the Tallulah; 8 men are running a drift upon the ledge. Sprague & Co.'s mill has commenced crushing ore from the Laug Syne; 8 men are sinking and drifting upon the Stanford ledge.

REESE RIVER.

Reese River—*Reveille*, Aug. 10: Saybrook.—The 150-ft. east level is being steadily pushed night and day; getting some good ore.

South America.—Getting the old workings cleared of water and dirt, preparatory to doing new work.

Savannah.—Shaft going downward rapidly and steadily.

Freehold.—Shaft going down for the purpose of opening a new level.

Lane & Fuller (Pacific Co).—A large amount of ore will be worked at the Manhattan mill from this mine next week. The mine is steadily improving, and is being vigorously worked.

Morgan & Muncy.—Good ore coming out.

Star of Nevada.—The main tunnel is in nearly 600 ft. and is being driven further.

Lone Star.—Mine looks encouraging.

Piute.—Good ore coming out.

Oregon Shaft.—The mines being worked through this shaft are in splendid condition, looking well and sending up a large amount of first-class ore.

Providential.—Work suspended.

Yankee Blade—Kling & Kelley.—New contracts being let; 20 men employed; force to be increased; donkey engine being erected on air shaft; mine looks good.

Ensign & Southal.—Incline going down on the ledge and exposing good ore.

Sloan & Cooper.—Drifting to the eastward on the ledge, getting ore.

Belmont—El Dorado Co.—Have commenced stoping, and are taking out splendid ore. A new steam pump will be placed in position at the bottom at once.

Monitor Co.—Taking out fine ore; 160 tons in the ore house valued at $250 per ton. Their big tunnel is in 150 ft.; will reach the vein in 150 ft. more; working 30 men.

Belmont Co.—Sinking on Canfield; will soon start off new levels. Also sinking on Highbridge; will soon put up steam hoisting works; working 20 men.

Combination Co.—Working 20 men; taking out fine ore; shipped to Manhattan mill, 25 tons of very rich ore, and lots of the stuff left.

The El Dorado Co. have purchased the Battle Mountain 20-stamp mill, which is being taken down.

Ione—Crown.—Beatty, Sargent & Co., have struck the lode below the break, at a depth of 80 ft., finding five ft. of quartz, carrying from 18 to 20 inches of ore that will mill $200 per ton. They are erecting a whim.

Stonewall.—A force of 8 or 10 men will be put on in a few days.

WASHOE.

Local Summary.—Gold Hill *News*, Aug. 17: Belcher.—Daily yield 360 tons, from the 1,100 and 1,000-ft. levels. The ore breasts are looking well. The main east drift at the 1,000-ft. level, from the incline is in 173 ft., with the face in favorable vein matter. A drift from it, 109 ft. from the incline, is in 37 ft., progressing to meet the drift south from the 1,000-ft. level, which is in fine ore.

Crown Point.—Daily yield 350 tons. The yield last month was 11,000 tons, averaging $25 to the ton; total $385,000. The opening out of the 1,300-ft. level is progressing energetically.

Gold & Curry.—The incline is down 122 ft. below the 1,500-ft. level, making a total perpendicular depth reached of 1,600 ft. The north drift from the 8th station is in 421 ft. and shows some little quartz. The east drift at the 10th station is in 227 ft., cutting some small seams of quartz during the week. The north drift at the 10th station is in 160 ft. and the south drift in 150 ft., the face of both in porphyry.

Julia.—Owing to a breakage in some of the hoisting machinery, work has been suspended in both the shaft and drift.

Woodville.—All the ore-producing sections are looking well, and yielding ore enough to keep the mill steadily running.

Overman.—The shaft is down 45 ft. below the 1,100 ft. level. The main west drift on the 1,000-ft. level has made but little progress during the week having to re-timber a portion of the drift.

Cons. Virginia. — On the 600-ft level the south drift is being continued; a cross-cut is being run east and west from the south end of this drift. All of these drifts are in solid quartz of a favorable character. On the 1,666-ft. level they are cross-cutting west, and expect to reach the vein within 2 days.

Ophir.—The shaft is down 130 ft. below the 1,300-ft. level, in fair sinking ground. The north drift of the 1,100-ft. level is in 65 ft., passing during the week through a heavy body of black dyke.

Savage.—Daily yield 175 tons, worth $28 per ton. The incline is down 125 ft. below the 1,500-ft. level, making slow progress. The south drift on the 1,500-ft. level is in 70 ft. south of the east cross-cut, making 150 ft. from the incline, and will connect with the winze in about 10 days.

Hale & Norcross.—Daily yield 80 tons, 40 tons of which is taken from the upper levels. The work of exploration in the southern portion of 1,500-ft. level is being continued. The main incline is sunk 145 feet below the 1,500-ft. level.

Yellow Jacket.—Daily yield 20 tons. The drift east, at the 1,500-ft. level, from the incline, is in 56 ft. The drift north, at the 13-ft. level, is being driven ahead at a satisfactory rate.

Knickerbocker.—New shaft down 70 ft. below the 400-ft. level. On Wednesday it is proposed to commence drifting at the 400-ft. level for the ledge.

Chollar-Potosi. — Work on the new machinery is pushed steadily. The shaft is repaired to the top of the incline 800 ft. below the surface.

Silver Hill.—Good progress is being made in sinking the main shaft. To-day they have commenced to cut out for the first station, and will commence to drift for the ore vein within 2 days.

Caledonia.—The west drift, at the 400 ft. level is in about 420 ft. in the east casing. The west drift from the 700 ft. level is in 92 ft. in hard blasting ground.

Imperial-Empire. —Prospecting in both the 1,500 and 1,600 ft. levels is being pushed ahead with vigor. The ore in the winze on the 1,600 ft. level is improving in quality as depth is attained.

Buckeye.—The incline is sunk 362 ft. The face of the south drift is in fine ore; the various ore breasts are looking splendidly and the bullion yield satisfactory $1,850 having been shipped day before yesterday.

Phil Sheridan is worked by means of a tunnel about 300 ft. in length, and a shaft is being sunk from it to develop the ledge below.

Utah.—Sinking of the main shaft is continued day and night with 3 shift of men.

Kentuck.—Daily yield 45 tons from the old levels.

Ben Jacket.—The main ledge continues to show better as deeper developed, and some excellent ore is being extracted for milling.

Sutro Tunnel.—Total length 3,000 ft. Work in both the tunnel and shafts along its line progressing energetically.

Justice.—The old Waller Defeat section yielding considerable good paying ore.

WHITE PINE COUNTY.

Review.—White Pine *News*, Aug. 17: Bullion.—The shipment during the past week, was $33,930.49.

Treasure Hill Mines—Eberhardt & Aurora Co.'s Mines.—In the Eberhardt, connecting the Keystone and Blue Belle shafts, for ventilation, in order to sink the Blue Belle deeper; but there is still remaining a drift of about 60 ft. to be completed, for this purpose. Working a force of men night and day. In the North Aurora, south end, the Ridsdale and De Pass chambers show no material change. In the north end work in the Lady's chamber is being prosecuted to the southeast. At present breaking down ore in the Ward Beecher. The International Mill is steadily running.

Beecher Con. Co.—In the North Beecher shaft, a small body of good-grade ore, about 2 ft. thick, has been struck, widening as the drift progresses. Shipping about 35 tons of first-class ore from the Beecher and Edgar mines, daily, to the Co.'s mill.

Silver Wave.—The Boswell works seem to improve as they are being developed. Shipping about 13 tons of ore per day to the Swansea Mill.

Noonday.—The new shaft sunk on croppings is down 175 ft., and about 10 ft. through a body of bigh-grade ore.

Pennsylvania.—In the Jackson shaft, down 25 ft. a body of ore has been struck.

San Juan del Rio.—Ore is being taken out and will be shipped this week to the mill.

Treasure.—The Wheeler tunnel is in about 335 ft. and running on a spar vein of 28 ft.

East Shenoyoan.—Good ore continues to be extracted from the Exchange and Regent drifts; also from the South drift. The ore chamber continues to yield good ore.

Copper Glance. —The North shaft and Northwest drift are in good ore.

Pogonip & Othello.—Running east in a body of ore in the tunnel.

Outside Districts—Schell Creek. —The 5-stamp mill at Rubyville has started up on ores from the Birch mine; but having a small supply of quicksilver was forced to shut down.

Mocking Bird.—New contract to sink 50 ft. has been let during the week. Shaft has been timbered throughout and new and substantial ladders placed in mine. The ledge continues widening as sunk upon, and shows fully 4 ft. in width.

Sterling.—Sinking shaft and making good progress. Ore in bottom has improved greatly during the past week.

Robinson.—The Canton furnace has made a successful run.

Mills—Manhattan.—Running steadily on ore from the Beecher Con. Co.'s mines.

International.—Running on ore from the Eberhardt & Aurora Co.'s mines.

Big Smoky.—Running on O. H. Treasure ore.

Swansea.—Running on rock from the Silver Wave.

Arizona.

Yavapai County.—Prescott *Miner*, Aug. 3: The Tiger people have the new shaft down 104 ft. and the lode is looking remarkably well.

Mohave County.—Work in the Williams Fork copper mines is progressing favorably.

Maricopa County.—Returns from Silver Queen ore shipped to S. F. are, 5¼ tons were sold for $778.62; cost of freight, $440.40, leaving $338.22.

Colorado.

Fairplay County.—Denver *Tribune*, Aug. 14: Dr. Morrison is putting up crushing and sampling machinery at a settlement located at the timber line of Mt. Lincoln.

Mr. Dudley is erecting smelting works at Lincoln, 8 miles from Fairplay.

New discoveries of veins and deposits are frequently being made.

Items—Boulder Co.—Colorado *Miner*, Aug. 8: J. P. Lesher has struck a new and rich lode below the Poor Man, in Grand Island Dist.

On the McFarland mountains, Honten & Co. are sinking on the English Banker with good prospects.

Albright & Co. on Pomeroy mountains have their shaft down 70 ft., and are taking out good ore.

Work will soon be resumed on the North Western.

Above the Caribou W. J. Mann & F. C. Albright are taking out of their discovery as good ore as the Caribou ever yielded at the same depth.

Work has been resumed on the "Sovereign People," at Caribou; Gunn & Co. having taken contracts to sink the discovery shaft 60 ft., and the east shaft 40 ft.

Ed. Fuller has struck a rich lode about a mile west of the Caribou, and about 6 miles further west, Frank McLothin is working a late discovery with profit.

Mr. McBride has sold a third interest in the Isabella to parties in Longmont.

Lake Co.—Capt. Breece is about to commence work on the Berry tunnel.

Summit Co.—Placer mining is in full operation. French Gold Run, Humbug, and other gulches are doing well.

Gilpin Co.—J. B. Chaffee is about to begin work on the Saxon lode.

Work on the Briggs is delayed by the non-arrival of the Co.'s machinery.

The National G. M. Co.'s claim on the Kansas is in good pay.

Mr. Perrin has commenced hoisting water from his mine on the Pewabic lode, preparatory to active mining.

Haskins & Fitzsimmons, working the west drift on the Fiske lode from the Bobtail tunnel, have struck rich ore, 40 ft. from the tunnel. The crevice is 4 ft. wide, with 2 ft. of solid ore.

Park Co.—The Baker is producing largely, and only first-class ore. The Juniata and Musk Ox are developing up admirably.

Prof. Hill, of Black Hawk, has commenced the erection of smelting works at Montgomery, which have a crushing capacity of 15 tons per day. The Moose Co. also intend to erect smelting works at the base of the mountains.

Idaho.

Strike.—Owyhee *Avalanche*, Aug. 10: There has been a rich strike made in the 3d level of the Rising Star, Flint Dist.

Montana.

French Gulch.—Deer Lodge *Independent*, Aug. 10: The miners are doing better than for several years past.

Holcomb, Bell & Roe took out $2,570 from their claim on Pilgrim Bar last week.

Utah.

Bullion.—S. L. *Tribune*, Aug. 12: During July, Dinant & Cutting shipped from Flagstaff, Bullion weighing 328,345 lbs.; from the D. & B. 230,959 lbs., from the Utah 174,518; and from the Saturn 148,118 lbs. Total 882,940 lbs.

Camp Floyd.—Cor. same: Rich strikes are reported in several mines, especially in the Mormon Chief.

Bingham Canon.—A new Co. has been recently organized. They have arranged to develop about 60 claims. They are putting 40 men to work. Capital stock $2,000,000.

American Fork.—The Emma and Flagstaff are the only mines on Emma Hill that are doing any great amount of work. It is reported that the Savage, Montezuma, Hiawatha and and Last Chance mines have been consolidated and sold to an English Company for 1,500,000.

The Sierra is the best mine on Mills hill. Three assays taken at different depths gave $105, $109 and $137 in silver and a good per cent. in lead.

United States Mining Laws and Regulations Thereunder.

[Continued.]

81. All fees or charges under this act, or the acts of which it is amendatory, may he paid in United States cnrrency.

82. The register and receiver will, at the close of each month, forward to this office an abstract of mining applications filed, and a register of receipts, accompanied with au abstract of mineral lands sold.

83. The fees and purchase money received by registers and receivers must he placed to the credit of the United States in the receiver's monthly and quarterly account, charging up in tbe dishursing account the sums to which the register and receiver may be respectively entitled as fees and commissious, with limitations in regard to the legal maximum.

84. The thirteenth section of the said act of May 10, 1872, provides that all affidavits required under said act, or the act of which it is amendatory, may be verified before *any* officer authorized to administer oaths within tbe land district where the claims may be situated, in which case they will have the same force and effect as if taken before the register or receiver, and that in cases of contest as to the mineral or agricultural character of land, the testimony aud proofs may he taken before any such officer on personal notice of at least ten days to tbe opposing party, or if said party cannot he found, then, after publication of notice for at least once a week for thirty days, in a newspaper, to he designated hy the register as puhlished nearest to the location of such land, proof of which uotice must he made to tbe register.

85. The instructions heretofore issued with regard to disproving the mineral character of lands are accordingly modified so as to allow proof upon *that point* to be taken before *any* officer authorized to administer oaths within the land district, and that wbere the resideuce of the parties who claim the laud to he mineral is known, such evidence may he taken without pnblicatiou, ten days after the mineral claimants or affiants shall have heeu personally notified of the time and place of such hearing; hut in cases where such affiants or claimants cannot he served with personal notice, or where the land applied for is returned as mineral upon the townsbip plat, or where the same is now or may hereafter he suspended for non-mineral proof, by order of this office, tben the party who claims the rigbt to enter the land as agricultural will he required, at his own expense, to puhlish a notice once each week for five consecutive weeks in the newspaper of tbe largest circulation puhlished in the county within which said land is situated, or if no newspaper is puhlished within such couuty, then in a newspaper puhlished iu an adjoining county; the newspaper in either case to be designated hy the register; which notice must be clear and specific, embracing the points required in notices under instructions from this office of Marcb 20, 1872, and must name a day after the last day of puhlication of such notice, wbeu testimony as the character of tbe land will he taken, stating before what magistrate or other officer such hearing will be had, and the place of such hearing.

MILL-SITES.

86. The fifteenth section of said act provides, "That where non-mineral land not contiguous to the vein or lode is used or occupied hy the proprietor of such vein or lode for mining or milling purposes, such non-adjacent surface-ground may be embraced and included in an application for a patent for such vein or lode, and the same may be patented therewith, subject to the same preliminary requirements as to survey and uotice as are applicable under this act to veins or lodes: *Provided*, That no location hereafter made of such non-adjacent land shall exceed five acres, and payment for the same must be made at the same rate as fixed hy this act for the superficies of the lode. The owner of a quartz-mill or reduction works, not owning a mine in connection therewith, may also receive a patent for his mill-site as provided in this section."

87. To avail themselves of this provision of law, parties holding the possessory right to a veiu or lode, and to a piece of land not contiguous thereto, for mining or milling purposes, uot exceeding the quantity allowed for such purpose hy the local rules, regulations, or customs, the proprietors of such vein or lode may file in the proper land-office their applicatiou for a patent, under oath, in manner already set forth herein, which application, together with the plat and field-notes, may include, embrace, and describe in addition to tbe vein or lode, such noncontiguous mill-site, and after due proceedings as to notice, etc., a patent will be issued conveying the same as one claim.

88. In making a survey in a case of this kind, the lode-claim should he deserihed in the plat and field-notes as "Lot No. 37, A," aud the mill-site as "Lot No. 37, B," or whatever may he its appropriate numerical designation; the course and distance from a corner of the mill-site to a corner of the lode claim to be invariahly given in such plat and field-uotes, and a copy of the plat and notice of application for patent must be conspicuously posted upon the mill-site as well as upon the vein or lode for the statutory period of sixty days. In making the entry no separate receipt or certificate need be issued for the mill-site, hut the whole area of both lode and mill-site will be embraced in one entry, the price being five dollars for each acre and fractional part of an acre embraced by snch lode and mill-site claim.

89. In case the owner of the qnartz-mill or reduction works is not the owner or claimant of a veiu or lode, the law permits him to make application therefor in the same manner prescribed herein for mining claims, and after due notice and proceedings, in the ahsence of a valid adverse filing, to enter and receive a patent for his mill-site, at said price per acre.

90. In every case there must be a satisfactory proof that the land claimed as a mill-site is not mineral in character, which proof may, where the matter is unquestioned, consist of the sworn statement of the claimant, supported hy that of one or more disiuterested persons capahle from acqnaintance with the land to testify understandingly.

91. The law expressly limits mill-site locations made from and after its passage to *five acres*, hut whether so *much* as that can he located depends upon the local customs, rules, or regulations.

92. The registers and receivers will preserve an unbroken consecutive series of numhers for all mineral entries.

PROOF OF CITIZENSHIP OF MINING CLAIMANTS.

93. The proof necessary to estahlish the citizenship of applicants for mining patents, whether nnder the present or past enactments, it will be seen hy reference to the seventh section of the act under consideration, may consist, iu the case of an individual claimant, of his own affidavit of the fact; in the case of an association of persons *not* incorporated, of the affidavit of their authorized agent, made on his own knowledge or upon information and helief, that the several members of such association are citizens; and in the case of an incorporated company, organized under the laws of the United States, or the laws of any State or Territory of the United States, hy the filing of a certified copy of tbeir character or certificate of incorporation.

94. These affidavits of citizenship may be taken before the register or receiver, or any other officer autborized to admiuister oaths within the district.

95. Copies of the previous mining statutes of Congress, dated respectively July 26, 1866, and July 9, 1870, are hereto attached. Sections one, two, three, four, and six of the former heing expressly repealed hy the ninth section of the act of May 10, 1872, aforesaid, which in its sixteenth section also repeals all acts and parts of acts inconsistent with its provisions.

96. The foregoing will be followed in due time hy such further instructions as actual experience in the admiuistration of the statute may render necessary.

Very respectfully, your obedient servant,

WILLIS DRUMMONN, Commissioner.

To REGISTERS and RECEIVERS, and SURVEYORS GENERAL.

A.—CHAP. CCLXII.

AN ACT GRANTING THE RIGHT OF WAY TO DITCH AND CANAL OWNERS OVER THE PUBLIC LANDS, AND FOR OTHER PURPOSES.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the mineral lands of the public domain, hoth surveyed and unsurveyed, are herehy declared to be free and open to exploration and occupation hy all citizens of the United States, and those who have declared their intention to become citizens, subject to such regulations as may he prescribed by law, and suhject also to the local customs or rules of the miners in the several miniug districts, so far as the same may not he in conflict with the laws of the United States. [Repealed.]

SEC. 2. *And be it further enacted*, Tbat whenever any person, or association of persons, claim a vein or lode of quartz, or other rock in place, bearing gold, silver, cinnebar, or copper, having previously occupied and improved the same according to the local customs or rules of miners in tbe district where the same is situated, and having expeuded in actual labor and improvements thereon an amount of not less than one thousand dollars, and in regard to whose possession there is no coutroversy or opposing claim, it shall and may he lawful for said claimant, or association of claimants, to file in the local land-office a diagram of the same, so extended latterly or otherwise as to conform to the local laws, customs, and rnles of miners, aud to enter such tract and receive a patent therefor, granting such mine, together with the right to follow such vein or lode with its dips, angles, and variations to any depth, although it may enter the land adjoining, which laud adjoining shall be sold subject to this condition. [Repealed.]

SEC. 3. *And be further enacted*, That upon the filing of the diagram as provided in the second section of this act, and posting the same in a conspicuous place on the claim, togetber with a uotice of intention to apply for a pateut, the register of the land-office shall puhlish a notice of the same in a newspaper puhlished nearest to the location of said claim, and shall also post sucb notice in his office for the period of ninety days; and after the expiration of said period, if no adverse claim shall have heeu filed, it sball be the duty of the surveyor general, upon application of the party, to survey the premises and make a plat tbereof, indorsed with his approval, designatiug the number aud description of the location, the value of tbe labor and improvements, and the character of the vein exposed; and upon tbe payment to the proper officer of five dollars per acre, together with the cost of such survey, plat, and notice, and giving satisfactory evidence that the digram and notice have heen posted on the claim during said period of ninety days, the register of the land-office shall transmit to the General Land-Office said plat, survey and description, and a patent shall issue for the same thereupon. But said plat, survey, or description shall in no case cover more than one vein or lode, and no patent shall issue for more than one vein or lode, which shall he expressed in the patent issued. [Repealed.]

[To be Continued.]

Tessie du Motay's Copper Process.

We give below the process of M. du Motay, for treating pyritiferous ores, from the description filed at the Patent Office:

"It is well known that sulphuric and chlorohydric acids employed singly or together dissolve but little or not at all, the or not containing gold, silver, lead, antisulphurets and the double oxysulphurets of copper and iron containing or not contaiuing gold, silver, lead, antimony aud arsenic.

"It has heen impossible, heretofore, to successfully treat these ores in a crude or roasted state, either hy sulphuric, or chlorohydric acid, or by a mixture of these two acids. The solutions of persulphate of iron used alone, cold or warm, to dissolve these ores act very slowly, and for this reason they cannot be successfully employed to melt the copper contained in the complex pyrites, containing this metal alone or mixed with gold, silver, lead, autimony aud arsenic.

"We have discovered a new dissolvent—positive and economical—of the ores of copper, carhonates, oxides, and douhle or multiple sulphurets, and also matts and hlack coppers containing or uot containiug gold, silver, lead, antimony and arsenic.

This dissolvent—which has for its ohject to rapidly dissolve the sulphurets aud oxysulphurets, and all other copper ores, roasted or not—is a mixture of persulphate of iron and chlorohydric acid, or, what amounts to the same, a bath of persulphate of iron, through which passes a continuous current of gaseous chlorohydrio acid.

"The iron, copper, antimony and arsenic rapidly and entirely dissolve in this compound. The iron, oopper aud antimony, dissolved first to a state of chloride, finally return, in yielding their chlorohydric acid, to the state of sulphates, while the arsenic remains in solution, in a state of chloride. The other metals, such as silver and lead, are attacked first hy the chlorohydric acid, and finally precipitated in an insoluble state, in the form of sulphates. The gold, unattacked, follows them into the insoluble residuum. This residuum, separate from the liquid part, is first roasted aud afterward reduced, in the presence of lead, in the cupel. The liquid hath, containing the sulphates of iron, copper and antimony, and the chloride of arsenic in solution, is evaporated to dryness. During the concentration of the hath, a part of the chloride of arsenic volatilizes, while the other part remains in the liquor.

"The salts after evaporation, are recovered hy the water; the sulphate of antimony is precipitated to the state of snhsulphate, nearly insoluhle; and the chloride of arsenic, remaining, passes to the state of arsenious acid, likewise not soluble; while only the copper and iron remain dissolved in the liquor.

When, during the evaporation, all the chlorohydric acid has not heen expelled, and only the antimony and arsenic are left in a chloride state in the liquor, similar reactions to those before described occur—that is to say, the chlorides of arsenic and antimony, recovered by the water after evaporation, pass away, the first in a state of arsenious acid, and the second in a state of oxychloride, insoluhle. The douhle sulphates of copper and iron remaining in solntion are treated hy means of metallic iron, which precipitates the copper by the process of cementation. The protosulphuret of iron remaining is treated, in either a moist or hard state, by the oxygen of the air, or by a mingling of air, chlorine, or nitrous vapors, which brings it to a state of persulphate. The hydrated peroxide of iron remaining insoluble from this operation is separated by decantation and set aside. Suhsequently treated, and dissolved hy sulphurous acid liquid, in conuection with air, it produces sulphate of peroxide of iron, which serves to replace the quantity of sulphate lost in the pre ceding operations. In this manner the chlorohydric acid is displaced by persulphate of iron, which serves the same as the persulphate in the other operation.

It sometimes occurs that in the double liquid of sulphate of copper and iron a small portion of sulphate of silver remains insoluhle. To precipitate to a metallic state the silver contained in this sulphate we cause the reaction of plates of copper or lead, which adhere to the silver, and which we add to the insoluhle residuum before being treated in the cupel.

Claim 1. The mingling of persulphate of iron and chlorohydric acid, which constitute a new and positive dissolvent of the ores of copper, carbonates, oxides, and double or multiple sulphurets, likewise matts and black coppers containing or not containing gold, silver, lead, antimony and arsenic.

2. The reaction above described for obtaining in an insoluble state salts and precious metals contained in copper ores treated by our dissolvent.

3. The separation of the copper in a pure state and the removal of the antimony and arsenic.

4. The incessant regeneration of persulphate of iron and chlorohydric acid, constituting our dissolving liquor.

5. The employment of persulphate of iron with sulphuric acid, in the same manner as we have used ehlorohydric acid.

Separating Silver from Copper.

R. Palm, says the *Scientific American*, prepared the nitrate of silver from small Russian coin, containing a considerable percentage of copper. A rapid separatiou was necessary, and the utensils generally employed in effecting this separatiou of the two metals were wanting. Under these circumstances he resorted to concentrated nitric acid, the different behavior of the two metals to the acid producing the separation.

The solution of the coin is evaporated to the consistency of a thick oily liquid; it is then mixed with concentrated uitric acid (free from hydrochloric acid) when the salt will be precipitated in a crystalline form, while the copper remains in solution. The precipitate, which has still a hluish cast from adhering copper, is easily freed from it by washing it three or fonr times with concentrated nitric acid, it becomes then perfectly white and free from copper. The acid which still adheres to the silver salt evaporates by drying. It is ahsolutely necessary that the solution of the two metals is only evaporated to the oily consisteucy; for when we evaporate to dryness the copper will adhere so firmly to the silver that it can only be separated from it with difficulty. The more concentrated the uitric acid, the more complete will be the precipitation; but even a specific gravity of 1,250 will answer. For every part of solution of the metals three to four parts of nitric acid are necessary.

Mining Machinery.

Coal mining by machinery is likely soon to be a successful fact. The successful working of a coal cutting machine in England is likely to hasten such a consummation and also bring some relief to the threatening fuel famine of that country. The machine referred to is said to do the work of thirty men, with little wasto, and better general results than the old methods of mining. It is run by the help of two men, cutting during the night all that can he removed during the day. It is also represented to work successfully in iron, copper and other mines. It would certainly he a great relief if the most laborious and dangerous part of mining could be accomplished, and thus relieve thousands from underground labor, to say nothing of the great question of strikes among our mining population, which particularly makes sad havoc to the business calculations of our manufacturers, bringing also serious social disturbances in many communities. It is to be hoped, in view of the increasing importance and extent of the mining developments of our conntry, that inventors will not overlook its necessities, and the certainties of a rich reward for any successful efforts to meet the wants and the busiuess requirements of this great field for inventive genius.—*Am. Manufacturer.*

THE NEW ENGLISH MINING LAW.—One of the provisions of the new mining law which has just gone into operation in England creates a system for securing the competency of managers, another lays down certain general rules for the prevention of accidents; a third provides that an amount of ventilation shall be produced in every mine sufficient to dilute the uoxious gases; a fourth establishes a hoard of inspectors to see that the various provisions are carried out. It is further provided that miues shall he inspected at least once in twenty-four hours, and regular reports made.

Useful Information.

Changes of Climate.

Recent upheavals in circumpolar lands are corroborated, in the opinion of Mr. Howorth, in *Nature*, by many evidences of change in climate. An increase of land at the poles, at the expense of the water, will tend to intensify the extremes of temperature in winter and summer, thus making the climate much more less constant and much more severe.

At the present time the name of Greenland is little less than a satire on the country But we have already referred to Mr. Whymper's collections of fossil leaves and fruits from the neighborhood of Disco Island, which indicate a vegetation of southern character and luxuriance for this land above the 7th parallel of latitude in former times. In later times evidence of emigration on the part of Esquimaux from north to south is found in the fact that they were not known as inhabitants of Greenland to the Saga writers; and also in the fact that North American Indians, along their frontier, have a uniform tradition that the Esquimaux were formerly not neighbors of theirs, but that they came across the sea from islands beyond. Moreover, the Esquimanx of both shores of Behring's Straits have been constantly drifting southward, and are only recent occupants of their present areas.

Iceland is well known to have become harsh and untenable in its climate since the days of Norsemen. Ancient Icelandic documents show that on the arrival of the Norwegians, and for centuries afterwards, extensive forests grew in different parts of the island, and furnished the inhabitants with wood both for domestic and nautical purposes. Now these have either wholly disappeared or have dwindled down to mere underwood of birch, willow and mountain ash. Grain, too, was once largely raised there. Now the climate is too severe for the growth of any sort of grain.

The old Norse word for barley still lingers in names in Norway where barley grows no longer. In Scotland many places show signs of the plow for cereal culture where arable farming is unpracticed at the present time. Even in England, as far south as Lancashire, large districts that were once covered with forests are now entirely bare of trees, because trees cannot be made to grow there. "The Romans planted vineyards and made wine in parts of England where the vines will now hardly grow." Beyond the Dwina of Northern Russia there is a large area formerly known as Biarmia, studded with the graves and other remains of a prosperous people, whose wealth and civilization are much dwelt upon by the Saga writers. Others found there these agricultural inhabitants, with their tilled fields. Subsequently they moved westward and southward into Finland.

In Siberia Hedenstrom found on the tundra among steep banks of lakes and rivers large birch trees, complete with bark, branches and roots, apparently perfectly preserved, yet so thoroughly decayed that on being lighted they would glow, but never burst into flame. The first living birch trees appear now quite three degrees to the south, and then only as shrubs. In a cliff beyond the Malaija Kurspataschnaja river birch roots were seen as fresh as if only just torn from the trees, while the nearest woods are seventy miles away. The limit of trees, therefore, in this country, in quite recent times, has been pushed far to the south, without doubt, by increased severity of climate.

How to test Pure Glycerine.—Thomas Koller gives, in a German journal, the methods for detecting the impurities of glycerine. Pure glycerine is neutral, and leaves only a slight residue when evaporated in a porcelain capsule. The adulterated article may leave considerable black residue, and react acid. Pure glycerine, when cautiously mixed with an equal volume of oil of vitriol, is not browned even after the lapse of several hours; the impure often browns immediately. A solution of oxalate of ammonia does not even produce a cloudiness when mixed with pure glycerine, but may give a precipitate with the impure. Pure glycerine, treated with nitric acid and nitrate of silver, yields no precipitate; sulphide of ammonia sometimes gives a black color in adulterated glycerine. Pure glycerine, in large and small quantities, is as clear as water; impure often shows different shades of color, according to the extent of its contamination. Pure glycerine rubbed between the fingers gives no greasy feeling, while the impure resembles fat. The freezing point of pure glycerine is near zero, while the impure may become solid at the same temperature as water. For the purification of glycerine, add ten pounds of iron filings to every 100 pounds of the impure liquid, and occasionally shake. In a few weeks, a black gelatinous sediment will settle and the supernatant liquid will be perfectly clear, and can be condensed by evaporation.

India Rubber.—There are in America and Europe more than 250 manufactories of india rubber articles, employing some 500 operatives each, and consuming more than 20,000,000 lbs. of gum per year.

Why the Sun Makes Round Spots.

Most or all of our readers have probably noticed often, and many doubtless have wondered at the fact that the sun, when shining through the slats of window blinds or other elongated or irregular apertures into a dark or moderately dark room, always falls upon the opposite wall in a series of round spots, instead of taking the form of the opening as artificial light does. The phenomenon has been a puzzle to even many philosophical minds.

We have often noticed the appearance, and admired the elegant and commingling circles of bright light that are pictured upon a white wall when a single opening is left in a blind, just as the sun is setting and have several times sought for an explanation, but never met with a satisfactory one until we found the following in a number of the *Manufacturer and Builder:* When light comes through a small hole into a dark room, it forms on the opposite wall an image of the object from which it proceeds, no matter what the shape of the hole; as, now, the sun is round, the image formed by its light will be round also. If the sun were square or triangular, its light under the above circumstances would form square or triangular spots. As it is, the round spots are real images of the sun of which fact you can convince yourself by watching such images on a day when floating clouds cover up the sun from time to time. You will see the images of the luminous edges of the clouds around your round sun-spots and their dard masses covering the same; and when you use a single hole, these appearances are very striking. The shape of the hole is of no consequence, provided it be small and of a diameter of one quarter of an inch or less.

If there are any of our readers who have never witnessed this phenomenon, it is well worth the while to seek a convenient place and arrange for it. The best impression is made in a bright day, when the sun is about one or two hours high and the room so situated that the suns' rays will pass though the aperture, directly across the room, to the opposite wall. All other avenues of light should be closed.

Paint for Outdoor Work.

A correspondent of the New York *Tribune* says:—Having had a large practical experience in paints of all kinds, I find the best priming for old wood-work, and in fact all wood-work that is exposed much to the weather, is simply Spanish white, or as it is commonly called, whiting mixed in pure, raw linseed oil; let it stand until it is thoroughly mixed, then reduce with oil and add the drier sufficient to dry it. This makes the best, hardest, most durable paint for first coat of anything I have ever tried. Reduce it to the ordinary thickness for priming and apply with an ordinary brush. It must be thoroughly beat together, so as to work out all the lumps of the whiting.

Another correspondent adds:—For weather-worn weather boarding take about one-half common whiting, one-half white lead, throw in small portions of red lead and chrome yellow to overcome the blackness of the wood, or add umber for a drab color. Fresh paint is always best. Hence, where persons wish to do their own painting, it is sometimes best to buy the paint dry. Take a board with a smooth surface, find a muller some three inches in diameter at one end, and conveniently shaped at the other to hold with both hands, and you can mix up your paint to answer your purpose. Flax seed oil is to be used; a little turpentine will make the paint flow more freely from the brush. Small portions of Venetian red and lamp black will do for a dark color. This is the result of thirty-five years' experience.

Insect Motions.—We have probably all wondered at the number of steps a little little child will take to our one when trying to keep up with us. If we could make our legs move as rapidly, we should be able to attain a great speed. It is doubtless owing, in part, to their diminutive size, that insects' wings and legs move so rapidly during locomotion. A scientific observer has made some curious investigations to ascertain the velocity the wings attain during flight. The insect was grasped at the back by a pair of fine nippers, and when it sought to fly one of its wings was directed in such a way that it rubbed its point against the surface of a smoked cylinder which revolved with a known velocity. The wing at each of these revolutions carried away a little of the black smoke which covered the cylinder, and left a trace of its passage. The result of the experiments, allowing in regard to the accuracy for a variety of distracting causes, was to show the following number of beats per second for the wings of each insect: The common fly, 330; the drone, 240; the bee, 190; the wasp, 110; the hawk-moth, 72; the dragon fly, 28; and the cabbage-butterfly which is inaudible, 9. By other variations of the experiments he arrived at similar results.
